It has been the intention of the government of British Columbia to deal with fresh legislation, at last winter's session of the Legislature; but as the final report of the Forestry Commission was not received in time, this legislation had to be postponed until next year, and as the government realized that vigorous action was necessary to carry on the temporary system for the protection of the forests from fire, a sum of one hundred and fifty thousand dollars was voted, to put into the field a well-organized force of men to give an adequate patrol, and strictly enforce the different regulations of the "Bush Fire Act." The season of 1910 being an usually dry season, necessitated expending to fight forest fires and cost of patrolling for the carrying out and enforcing the regulations, approximately $187,000.

The Honorable W. R. Ross, Minister of Lands, realizing that the larger the force or fire wardens to carefully patrol the dangerous localities in the Province, the more vigorous the enforcement of the "Bush Fire Act" in general, much less danger would be incurred to the great natural assets of the country at large, and has put into the field a much larger and better organized force of fire wardens than ever before, to make every effort to so minimize the possibilities of fire starting at all.

The force is organized in the following way:

The Province is divided into two groups, or sections—the mountain divisions, six in number, and the coast divisions, numbering four. Each to these divisions are in charge of a Divisional Fire Warden, and each division divided into four districts numbering in all one hundred and seven, and each district patrolled by a district fire warden, thus forming a complete patrol throughout the province.

As the dry season comes on more men are added to th edivisions where the most danger is.

These divisions are supervised by two head offices, one at Nelson, B. C., the other at Vancouver; these two offices receiving all reports and issuing any general orders from the department at Victoria.

All government road superintendents and foremen with their crews are under standing orders from their department to assist in suppressing any fires which may start in their vicinity; thus the government has a force of men, well equipped to combat fires, and also watch and see to it that no fires are allowed to be started if possible.

The means employed to patrol the various districts are arranged to most suit each district as follows: Launches, boats, canoes, horses, bicycles are used.

Laws Governing the Protection of the Forest From Fire—Permits

No person clearing land is allowed to light or start a fire for the purpose of cleaning such land, between the 1st day of May and the 1st day of October each year, without first obtaining a permit from the District Fire Warden, who inspects the land, and if in his opinion it is too dangerous a place to have a fire started, he can refuse to issue a permit; by this means the settlers are kept well in hand.

Regulations governing the operation of donkey engines for logging purposes: ....

The law states that a space of 50 feet on all sides must be cleared of brush; that a supply of not less than 400 gals. of water muse be available at each donkey engine, together with 12 galvanized buckets, six shovels, three on a good steel frame and securely fastened to the top of the smokestack, on a good steel frame and securely fastened to the top of the smockstack, not less than three times the area of the stack, to be not less than twenty-five squares to the inch, in mesh No. 16 B. W. G. A watchman must also be kept around to detect and put out any fires which may start in the vicinity of the engine.

Regulations warning persons lighting camp fires, or fires for cooking, in or near the woods, are posted throughout the timbered localities along the trails and roads.

Posters

Posters appealing to the people to give their sympathies and do all in their power to aid in every way the regulations provided by the government to preserve the greatest of their revenue producing resources, are distributed throughout the Province; the question of getting the sympathy of each individual, that they may realize that every foot of timber burned is a direct loss to the country at large, is in my opinion of the greatest importance, if that everyone who seeks a change, by taking a holiday in the woods, would only bear in mind that we are depending upon the wooded sections of the country for the regulating of our supply of water, for industrial and domestic purposes, for fuel, for the protection of game of all kinds, for the beauty and appearance of the great hills and mountains, that each individual should become a fire warden to help suppress and fires and thus preserve this great natural resource; after all it rests with the people, the government to originate regulations governing the cutting, the manner in which the cutting must be done, and in regards the disposal of the debris, the proper levying of a tax for every acre of timber land, for a revenue to maintain an adequate force to see to it that all laws are properly carried out, to protect in every way that the causes of waste and destruction from all sources are reduced to the lowest minimum; by so doing we not only preserve for the people of to-day this great natural resource that nature has so greatly endowed us with, but to protect for generations to come that which will give wealth and prosperity in untold measures.

I believe you gentlemen who are gathered together in convention at this time can, by a general exchange of views, and by a united action in your different states and provinces, do much to lay down reasonable and adequate resolutions which might be of great service to the different legislators, who frame and put on our statute books the laws which govern the different branches of the forest regulation.

Lumber Trade of British Columbia

Timber Resources Described in Interesting Official Handbook — Next in Rank to Mining Industry

The Handbook of British Columbia, published recently by authority of the Legislative Assembly, has the following article on the lumber industry in that province:

Next to her great industry in minerals, the most readily available, if not the most important, of British Columbia's natural resources is her immense timber reserve. The province may now be said to possess the greatest compact area of merchantable timber in North America. The total forest area of Canada is estimated at 1,657,600,000 square acres (exceeding that of the United States and Europe combined), and of this British Columbia has 182,750,000 acres. The immense extent of forest and woodland is not, of course, all of present commercial value, as much of it is covered with small trees, only fit for fuel and domestic purposes, which would not be considered as "timber" by loggers, who choose only the largest and best trees. As far north as Alaska the coast is heavily timbered, the forest line following the indentations of the shore and the river valleys and fringing the mountain sides. The douglas fir, the most widely distributed and valuable tree found on the Pacific coast, grows as far north as 51 degrees, where it is surplanted by the cypress, or yellow cedar, red cedar, hemlock and spruce. The fir is very widely distributed, being found from the coast to the Rocky Mountains. On the coast it attains immense proportions, sometimes towering to a height of 300 feet with a base circumference of 30 to 50 feet. The best average trees are 150 feet clear of limbs and five to six feet in diameter. The fir is the staple of commerce, prized for its durability and strength. The great bodies of this timber are found on Vancouver Island, on the coast of the Mainland and in the Selkirk and Gold Mountains. Next to the Douglas fir in importance are the cypress and red cedar, both of which are of great value and much in demand. Red cedar shingles are the standard, and are finding an increased market in Eastern Canada. The white spruce is also much sought after by certain builders for use in the better class of buildings. Hemlock is abundant in the province and possesses qualities which should make it more valuable than it is. The western species is different and much superior to the eastern hemlock, and is as serviceable in many ways as more prized lumber. There are many other trees of commercial value which are manufactured into lumber, including white pine, tamarac, balsam, yew, maple and cottonwood.

The trees indigenous to the province are: White fir, western white fir, mountain balsam, large-leaved maple, vine maple, red alder, arbutus, western birch, canoe birch, western dogwood, red cedar, American larch, mountain birch, western larch, white spruce, western black spruce, black spruce, white-marked pine, scrub pine, white wountain pine, yellow pine, western white oak, lance-leaved willow, willow, western yew, giant cedar, yellow cypress or cedar, western hemlock, Alpine hemlock.

There are 207 sawmills in the province, with an annual daily capacity of 4,500,000 feet, and 49 shingle mills with an aggregate daily capacity of 3,395,000 shingles. In addition many of the plants are furnished with planing mills, sash and door and other woodworking machinery. It is estimated that eighty to one hundred million dollars of capital is invested in the lumbering industry.

The output of lumber is increasing very rapidly, as will be seen by comparing the following figures showing the cut for several years:

1904	325,271,500
1905	473,713,900
1906	570,721,923
1907	846,000,000
1908	710,364,500
1909	875,000,000

The cut in 1907 resulted from a miscalculation of market requirements, and, followed by a partial failure of crops in the prairie provinces, necessitated the carrying over of a large surplus stock and caused considerable loss to some of the mills.

The liberal terms on which timber cutting licenses were granted previous to 1907 tempted speculation in standing timber, as the following record shows:

	No. of Licenses
1904	1,451
1905	2,173
1906	3,960
1907	10,924

These figures are exclusive of hand-loggers' licenses issued during the year, and show a remarkable increase in the acreage of timber staked. As each license represents a square mile, or 640 acres, the number of acres taken up in each year would be:

1904	920,320
1905	1,390,080
1906	2,527,760
1907	6,691,840

The immense area of timber covered by applications for licenses at the close of 1907 caused the government to declare a reserve on all timber lands undisposed of, and in consequence no more licenses to cut timber will be granted.

Notwithstanding the great increase in production, the prices of logs and manufactured lumber have just about doubled in the period covered by the above tables, and the tendency seems to be towards still higher prices in the future.

British Columbia cedar shingles are in high favor in eastern Canada and the Atlantic States, as well as in the Middle West. The fututre of the shingle business, as well as that of lumbering generally, is very promising.

A few years ago the lumber industry was confined almost wholly to the coast districts, where the big trees attracted capital, but as population increased in the interior and in the prairie provinces, the demand for lumber became greater, and sawmills were set up in many localities in the mountains to supply the new market. In 1909 the mountain mills cut 325,000,000 feet.

Changing Conditions in B. C. Trade

Important Economies Effected by Uniting Interests of Isolated Mills—Changes caused by U.S. Competition

The lumber industry in British Columbia and on the prairies has been undergoing rather a rapid alteration during the last year or two. Instead of a large number of mills each conducted as a separate institution, there are now a number of large manufacturing companies which own and control the output of a number of mills in different localities. These companies have affected an important saving in the costs of management and of marketing, by uniting their interests. They have in many cases directed especial attention to getting closer to the prairie markets and are, by this means, succeeding in fighting the keen competition which they had to face from the mills of the United States. The situation is well explained in a daily press report which recently appeared in a Vancouver paper as follows:—

The surplus of logs on the United States Pacific coast has induced loggers to consider the advisability of reducing the output. A logger in close touch with the situation stated recently that there is a surplus of 100,000,000 feet of logs on Puget Sound at present, and that the camps now in operation are dumping logs into the water much faster than they can possibly be consumed by the mills. Loggers are preparing for the annual suspension of logging operations around July 4. It is expected that instead of keeping the camps closed for one week, a longer suspension will be inaugurated. The recent curtailment campaign by the lumbermen has cut down the output of lumber more than 12,000,000 feet per week.

The process of evolution is noticed in the lumber industry in British Columbia. The visible result is the merger of interests and the establishment of retail yards on the prairies, controlled and operated directly by the mills.

The effect is the natural defence of lumber manufacturers, who have to contend with ruinous competition from the United States. It is an old story of how every other industry in Canada has received protection in the way of tariff and even a bonus, except the manufacturers of lumber. At present conditions are poor in the lumber producing states immediately to the south, and taking advantage of free entry into Canada, the Washington and Oregon mills are shipping approximately 20,000,000 feet of lumber into the Canadian west. They are shipping it at cost price, and this dumping has a bad effect on trade.

Some years ago, when large American operators began to secure interests in the interior of British Columbia, they brought into play methods which had been successful in the eastern and middle states. Instead of selling through a retailer, they began the establishment of retail yards in prairie towns. These yards are becoming more and more numerous. Mills with small capital were unable to do much, but now that immense amounts of money have come into the industry, every effort will be made to cope with foreign competition.

Early in the year announcement was made of the merging of the interests of two large companies on Vancouver Island, the Michigan Pacific and the Michigan Puget Sound Lumber companies. The principals in these concerns were the same in instances, and all lived in Detroit, Grand Rapids and Chicago. When the Fraser river lumber mills, operating one of the largest plants in the world on the

Fraser river, changed its name to that of the Canadian Western Lumber Company, the capital was increased to $20,000,000. The mill of the Columbia River Lumber Company at Golden was taken over by the same interests. The Dominion Sawmills, Limited, was floated in London, with a capital of $5,000,000, to take over six plants in the vicinity of Revelstoke. The British Canadian Lumber Corporation was formed with a capital of $20,000,000 to control the British Canadian Lumber Company, of Vancouver, build a mill on Lulu Island, acquire the interests of the Arrowhead Lumber Company, and to further extend the manufacturing facilities. The latest merger is that of several mills in East Kootenay, the capital in this case being also $20,000,000.

In connection with the latter, it was announced that a couple of hundred retail yards would be established on the prairies, and the mills will thus be able to sell their product direct.

It was because of the keen competition that the head office of the Mountain Lumber Manufacturing Association was moved this spring from Nelson to Calgary, so that the executive official could be in direct touch with the prairie market. With this move an aggressive sales department was organized.

For several years the western lumbermen have asked for a protective tariff equal to that on Canadian lumber going into the United States, and it looks as if they will never get it. To secure what business they can, new methods are being employed.

Many of the prominent lumbermen south of the boundary are not in favor of reciprocity in forest products, for the reason that it tends to more rapid destruction of the timber. One of them recently said that with free markets the same ruthless policy of waste would continue. For many years it has been the practice to leave in the woods the top part of the tree, and this is often as great in diameter as that of the average tree in Ontario, where it is regarded as valuable. If the limits of the market were curtailed, he contended that the manufacturer would have to use more of the tree, and the portion now relegated to the clearing fire would be found profitable. This condition applies particularly to Washington and Oregon, where the mills are very many, and where there is great overproduction. The suggestion has been made there to limit work to say four days each week, which would enable manufacturers to get rid of some of their surplus.

How Freight Bills Accumulate

Lumbermen have no need of an illustration of the autocratic methods of the railroads in the matter of handling of freight. They all know well enough, as the result of sad experience, that the railroads as a general rule, will handle their freight just as they see fit and will charge as exhorbitant a rate for their services as they can with impunity. Although lumbermen know all about this there is something so characteristic in a recent occurrence that it will be read with interest.

A car of lumber was shipped from Penetang, Ont., to Stevensville, Ont., via G. T. R. The haul was to be handled entirely by G. T. R. The car contained 36,400 lbs. of lumber or about 14,600 feet. It was worth in the neighborhood of $300. The freight should have amounted to $36.40. In some peculiar manner, known only to the railroads, the C. P. R. got hold of the car and by the time it reached its destination it had wandered aimlessly for some time over the C. P. R. tracks and had accumulated a freight bill of $59.42, which together with what the G. T. R. managed to charge for their services made a total freight charge of $84.90. On a car load of lumber valued at about $300, a freight charge of $84.90 is, in the language of the street, "some charge."

The uninitiated will ask naturally, "why did they pay the bill?" Therein lies the aggrevating feature of all similar troubles. The lumber was sold on a delivered basis and the recipient had no interest in the amount of the freight. He knew from experience that he must pay the freight in order to get the lumber. He also knew that if he did pay, the wholesalers who sold him the lumber would reimburse him. This is just what happened. The recipient paid the freight, and collected the amount from the wholesaler. The latter now has the unpleasant task of trying to get a refund from the railway, a difficult enough task under all circumstances, and he has also to face the loss of the use of his money during the interval.

The whole railway freight forwarding situation, from a shipper's point of view is out of joint. The Board of Railway Commissioners, or the government, whichever has the power, ought to see that this expensive drag upon the wheels of the country's business is removed.

The council of the board of trade of Victoria, B.C., have forwarded a memorial on behalf of lumbermen of Victoria for the removal of the arbitrary charges by railway companies for shipments destined for the prairies, to Mr. W. B. Lanigan, assistant freight traffic manager of the C. P. R. at Winnipeg.

An Inspection Bureau Much Needed

Definite Grading of Lumber and Official Inspection Proposed to Reduce Trade Difficulties

Editor, Canada Lumberman: I believe that the question of the proper inspection of lumber is the most important subject at present occupying the attention of manufacturers, wholesalers, and retail lumber dealers, in Ontario. The lumber business in the province of Ontario in its present state is, to put it mildly, nothing less than deplorable. This will be readily admitted by anyone who considers the facts of the situation. There is no set of rules for lumber inspection in the province. The wholesaler and the retailer are therefore between the devil and the deep blue sea, for several reasons. Travellers representing various firms call upon their customers to solicit business. Suppose they take an order and give their customer a description of the stock that they are offering, believing the description to be accurate, to the best of their knowledge and belief. This order in turn is sent to the mill. To all intents and purposes, the wholesaler expects that the lumber will be shipped out precisely as the order calls for. Upon arrival of the car at its destination, however, the wholesaler's customer finds that some stock has been loaded on the car that is not up to the grade he ordered. He reports the car as such, and in many cases even refuses to accept it. The traveller who sold the lumber is sent to look it over. He reports to his firm that the complaint is well founded and that the customer has good reason for complaint. The office of the wholesaler in turn reports the matter back to the mill and in nine cases out of ten the manufacturer writes back saying that he knows the grade was shipped alright. The manufacturer bases his opinion upon the report obtained from his inspector, who in many cases is not a competent man, and does not know his business. The wholesaler and retailer naturally do not assume that the millman's inspector is alright. The inspector of course, in order to clear himself, would not admit to his firm that he had shipped anything but what his order called for. He would be liable to lose his position if he did admit this to be the case. Therefore, we see that the wholesaler is between two fires.

The retailer is in a similar position to that of the wholesaler, as he is between the wholesaler and the customer. The manufacturer often thinks that he is being held up on such complaints, and that he is being dealt with unjustly. He may be entirely wrong, however, in thinking so, as the fault may lie at his end of the deal. The retail dealer also thinks that someone is trying to get the best of him, although the wholesaler is perfectly conscientious in what he has shipped to the retailer. When all is said and done there has been no end of trouble over the shipment. This is a state of affairs which should not be allowed to exist any longer. It could be remedied quickly enough. There should be some court of jurisdiction that could be appealed to, in cases of this nature. The following might be a practical solution of the difficulties which come in this manner from time to time:

There should be some definite rules regarding lumber grades. At present there are practically none. When this has been accomplished there should be a licensed inspector appointed between the manufacturer, the wholesaler, and the retailer, and between these three branches of the business his salary and expenses should be paid. His inspection of any lumber should be accepted as final between the manufacturer, the wholesaler and the retailer. When this has been done, all parties concerned will know that they are getting fair and honest treatment, which is all that a fair minded man can ask for. There are many cases in which a traveller tries to make his customer believe something which is contrary to the latter's own views. The traveller, like the mill inspector, may not know his business any too well.

A competent inspector would settle all these differences by taking copies of the order as given to the traveller, the order sent to the millman, the invoice to the retailer, and the invoice to the wholesaler. With these documents he will proceed to inspect the car, or stock in question, and give a ruling which would be accepted as final by the parties concerned. This would also do away with the raising of grades, a practice which is followed at times in the lumber trade.

This solution of the trouble would be fair to everybody concerned. I would like to see published the views of representatives of the different branches of the business on this subject. We ought to have the views, not only of the larger firms, but of the smallest manufacturers. The interests of the smallest firms will be protected as much as those of anyone else, by carrying such an arrangement into effect. It certainly can be done, and it must be done, and when accomplished, everyone interested in the lumber business will be more than satisfied with the good results obtained. The cost of such an arrangement to any one firm, or individual would be very slight. Our own firm would gladly furnish $100 a year as its contribution towards the salary of a competent staff of inspectors. —Wholesaler.

VIEW AND INTERVIEW

Various Opinions on Lumber Affairs

An Instructive Contrast

Mr. P. B. Roe, of Port Moodie, B. C., who recently returned from an eastern trip, has been much impressed with the contrast between the conditions in the lumber industry in the United States and Canada. On the American side he says that the lumber trade has been growing steadily worse, since the panic of 1907, when it became demoralized. In Canada, on the other hand, on account of conservative business methods, the lumber industry, although it has had quite a struggle, has been steadily recovering for the last year or so.

Over-production in the West

Mr. A. E. Gilbert, of the Red Cliff Lumber Company, in a recent interview expressed himself as follows regarding the outlook for the lumber industry:—

"You cannot push the lumber manufacturing industry ahead of its time," he said, "except to your sorrow, but when its time does come there is no force that can hold it back.

"People seem to get the impression from reading the newspapers that the demand for lumber is as great or greater than the supply," he continued. "This is wrong. There is an over-production on the Pacific coast at the present, and how to keep down the output so that the manufacturers will not be at the mercy of the buyer is a problem that is bothering the mill owners. In the states of Washington and Oregon a few mills have recently been shut down, while those that are still running have made an agreement to operate only five days a week.

"To-day the manufacturers of the eastern and southern states supply the big markets, but they have reached their turning point. Their standing timber is vanishing, and from now on their output may be expected to decrease every year. They will go the same way Michigan, Minnesota and Wisconsin have gone. Then with the opening of the Panama canal the Pacific lumber men will have their day, and that day will mean much more to British Columbia than to the states across the boundary line. The mill owners of British Columbia will be able to get the ships for the carrying trade while the Americans will not. The reason of this is that nearly all the lumber carrying ships on the Pacific are British or other foreign vessels. Any of these will be privileged to take on a cargo in a Canadian port and deliver it in an American port on the Atlantic coast, but they will not be privileged to carry from one American port to another. Any man in the lumber manufacturing business knows the advantage to-day of being able to get what cars he requires to take his product away as soon as it is ready for shipment. The man who cannot get cars as he wants them is seriously handicapped in competition with a man who always has them ready on his side track. In the same way the shipping conditions will be all to the disadvantage of the American manufacturer when the canal traffic begins."

Personal and Trade Notes of Interest to Lumberman

Mr. E. J. Moores of the Midland Lumber Company, was in Toronto on business on June 24th.

Senator Edwards of W. C. Edwards and Co., Ottawa, visited Toronto during the last week in June.

The North Channel Lumber Company, formerly the Saginaw Lumber and Salt Company, are erecting a burner at their mill at Thessalon, Ont.

Mr. A. S. Nicholson of Burlington, Ont., has taken his cousin Mr. Nicholson, into his company and formed the Nicholson Lumber Company. They have also opened up a yard in Hamilton and are doing a pregressive business both there and at Burlington.

Richard R. Alexander, of the B. C. M. T. & T. Co., of Vancouver, left recently for England via Montreal. He will be gone for several months. Mr. Alexander says the mill is sold practically a year ahead on foreign orders. John Hendry, the president of the company, is already in London, attending the coronation.

Mr. E. C. Plant of Thomas Mackarell and Co., Ottawa, visited Toronto during the last week in June on business. He reports that the export trade with Great Britain is good and that the prices are the equal of anything that they ever secured for the United States trade. The trade with the United States continues poor.

The Thessalon Lumber Company recently made a sale of twelve million feet of this season's cut to the Sheppard Lumber Company, of Waubaushene, Ont. This lumber will be shipped out by rail. The company are building a new tramway for their rail shipments and are putting in a spur line to connect with the C. P. R.

Mr. A. Knechtel, of the Dominion Department of Forestry, was recently in Brandon, Man., in connection with the re-forestry work being undertaken by the department east of that city. The large tract of country east and north of the Assiniboine river, known as the spruce woods, is to be replanted with pine, spruce, and tamarac.

Reports from Duluth, Minn., are to the effect that the lumber trade has been improving materially of late. Lumbermen in the northwest are looking forward to a great demand in the car trade during the coming fall, as a result of the prospect for a bumper crop. In comparison with the poor crop of last year, and the dull lumber trade which followed, these conditions are resulting in a general feeling of buoyancy.

Mr. L. J. Labelle, formerly secretary of the Cavendish Lumber Company, and local manager for the company at Lakefield, has been appointed to the position of manager of the Sheldrake Lumber Company at Sheldrake, Mich., which has recently been acquired by Messrs. D. C. Whitney, W. D. Lummis, H. J. Bartlett, Geo. Gordon, and D. C. Culver. The new owners are commencing to operate upon the property at once, and Mr. Labelle has already taken up his quarters at Sheldrake. Mr. B. Christie, formerly with the Strong Lumber Company, at Callendar and Cache Bay, has been appointed to Mr. Labelle's former position at Lakefield.

White, Gratwick & Mitchell, Inc., North Tonawanda, N.Y., have purchased the property of White, Frost & White, including in the sale the business, yards and docks of White, Frost & White at North Tonawanda, N.Y., at No. 1 Patterson avenue, New York, N.Y., The Island Box Company, of North Tonawanda, 15,000,000 feet of white pine, together with the steamer Ed. Smith and the barge Iron City. The Island Box Company becomes the box department of the new company. The officers of White, Gratwick & Mitchell, Inc., are: G. A. Mitchell, president and treasurer; W. H. Gratwick, vice-president; James L. Crane, secretary, all residents of Buffalo, N.Y.; H. J. McAvoy, superintendent.

English capital is being poured into British Columbia for investment in timber, lumber and pulp manufacturing. The capitalization of some of these companies would seem to the average investor in the United States as pretty steep, but perhaps long acquaintance with the game makes men too conservative, and the glittering generalities of the average promoter may yet turn into gold. Undoubtedly some of these new companies are simply exploiting the shareholders, who will wake up and find that they have been mercilessly plucked. Other concerns, legitimately capitalized, will prove dividend earners. It is the same old story. We have gone through it in the United States. No business can make a better showing on paper than the lumbering business.—The Lumberman.

Importance of Rocky Mountain Reserve

The setting aside of the Rocky Mountain forest reserve has been one of the most important advances yet made in the industrial history of Canada's central west. Not only is it important for the preservation of the forests along the slope with a view to the future supply of timber, but the preservation of these forests and their proper management means much for the preservation of the water powers and the maintenance of that steady and permanent water-flow which means so much for their value. Moreover, the regulation of the water of these streams, so as to provide a steady flow throughout the year and not to have a torrential flow in spring and (what is of even more importance) the drying-up (complete or partial) of the streams in summer, is of the utmost importance to the farms of the prairie provinces. Were the rivers to run short, the resulting lack of moisture in the soil would seriously interfere with the quantity of grain and other produce reaped from the fertile prairie.

During the whole of the past summer (1910) two parties of the Dominion Forest Service were in the field marking out the boundaries of the reserve. Both these parties started from Calgary; one worked south and succeeded in getting as far south as the international boundary, while the other, working north, reached a point almost due west of Lacombe (Alta). During the coming summer the location of the boundary will be continued, and it is expected that the entire eastern boundary of the reserve (which extends some forty to fifty miles north of the latitude of Edmonton) will be determined.

A full report of the operations of the past summer is given in reports transmitted to the Minister of the Interior through the Superintendent of Forestry by Messrs. G. H. Edgecombe, B. Sc., B.Sc.F., and P. Z. Caverhill, B.Sc., who were in charge, respectively, of the southern and northern parties.

The Retail Dealer and His Problems

The Profit or Loss Mountain—Side Line Trade

The Mountain

It is the item or detail in the conduct of a distributing yard which makes for a mountain of profit or loss.

The first and most important step to be taken is to see that the stock is graded to the best advantage; the next to see that it is so stored away as to prevent degrading as much as possible, and finally to see that this is done with as little handling and as cheaply as possible and in a manner to suit the shipping conditions.

Not long ago the foremen of two yards were confronted with the following condition:

Each yard received a shipment of 1 in. Sel. & better slash gr. O. P., destined for the kilns and which the respective kilns could not take care of for four months.

One foreman piled his stock between sticks to case-harden and check; the other piled his without sticks, to sweat and stain, keeping the ends even at one end, which caused the long projecting ends in the rear to check and warp.

Had either one removed the boards containing blue sap and piled the rest without sticking in double-faced piles the stock would have been kept soft and moist, preventing the piece above and below a sappy piece from becoming stained.

The other day a certain foreman wished to run all the 1x4 V. G. to T. & G. and found the five-months-old piles were not dry, as the boards were all lapped in the middle of the pile. This stock if properly piled would have dried within three months.

A row of piles was formed with an apron of stage in front of each, formed by leaving three courses project three feet in front of pile, which apron allowed the water to run into the pile in rainy weather and check and warp in good weather. These piles consisted of 1 in. Sel. & better O. P.

Holes 4 in. x 8 in. could have been left in the pile six feet apart and pieces of 3 in. x 6 in. put in the holes and pulled out and planks thrown across when in need of a stage, or pushed in when not in use, thus having a nice front on the pile.

I have seen piles of Clear O. P. 3 in. x 4 in. to 6 in. x 6 in. piled with the slash sides to the weather.

A portion of the common 1-in. stock intended for car shipments might well be sent to the mill directly from the wharf to fill orders for sheathing, as the knives of the planer will not degrade this stock when green to the extent that they do when dried out, and if piled face to face will keep bright on the surfaced sides.

I worked for a company in the South and we made principally car shipments, and hardly ever had a claim for not being up to grade. Yet the company lost money. Then came a new president, who said "Up-grade your stock," and we did; and then a few months later he said: "Up-grade it again," and we did, and finally received a claim or two, and then he said: "We are now shipping the grade that should have been shipped for the last two years."

The reason for this loss was caused by the previous manager firing any of the shipping force loading a car upon which a customer had made a claim on grade or for shortage.

If you have a tally-man shipping your stock against which there is never a claim, he is either a wonder or he is causing you a great loss in stock or grade.

Find out how many of your graders know the relative prices of the various grades of lumber which they are called upon to grade, and you will not wonder at the poor grading.

Find out whether your sawyer is a lumberman, your cut-off man also, and do not allow the sawyer to use double saws on certain stock.

Watch your matcher in operation, especially if it be of the fast-speed kind, and you will find that the man feeding same cannot usually keep up the speed and feed for the best results.

Trim your one-sided stock before running and your two-sided stock after running. I have seen this done the other way with much loss. By a proper distribution of the mill orders same can be so arranged as to prevent much rehandling at the mill and also keep a given machine supplied steadily with work.

This can be done by having a man load for a given machine, another for a given saw, etc., the order numbers in turn as wanted.

By getting the cutting lengths on such patterns as must be cut at the job, a lower grade of stock or shorter stock can often be used and a saving made.

Very few clerks actually have a full knowledge of the various patterns, and the parts of such patterns as show, which knowledge would often enable them to use stock which they now throw out.

You have probably noticed in large yards the percentage of men always going to and fro. If the percentage is high you can put it down that there is poor management somewhere. There are a number of reasons for this loss and it foots up to a great amount of time lost and money and energy wasted.

Either the piles are not systematically placed in sequence, but are piled promiscuously without regard to grade or size, compelling the clerk to locate each pile before starting to load, or he and his helper are hunting an empty truck.

I once tried the experiment of having a certain man make it his business to see that a few empty trucks should be always at hand in each gangway in the yard.

This resulted in my taking off two of my loading crews of two men each, which crews formerly spent one-third of their time hunting trucks or pretending so to do.

In other words, the foreman should expect to find his men handling lumber nine-tenths of the time instead of two-thirds of the time.

In a nearby yard the redwood stock is piled in four distinct parts of the yard and it is found necessary to have one man at four dollars per day to keep tabs on this stock.

The clerk hunts up this man at one of these four parts of the yard, whereas this information might be posted on a slate at the shipping office, and save thereby much time which is now lost.

It would take many months for the foreman of this yard to gradually rearrange the location of the various piles, but it would finally result in the saving of a few thousand dollars per year.

One or two vessels having arrived, extra men are put on, sometimes not enough to keep the unloading going on, and I have seen times when twenty more men were put on than were needed for the first day in the yard, as the stock will be slow coming up from the wharf until a half day after commencing work on the vessels.

The number of men required can be correctly gauged by knowing the character of the stock, the slinging capacity per gaft and the minimum cost per 1,000 feet of handling.

This is no time for guessing, be a little short-handed all the time, then all is bustle and hurry. Have too many on the job and the first to find it out are the men themselves, and there can be only one result.

Do you clean up your yard after each cargo? Do you make it as neat as possible? Do you keep men cleaning up all the time? Do you have the extra men help to tidy up your yard?

Put every available man on cargo while vessel is discharging, lay off those extra men shortly before vessel has finished unloading as these men are not familiar with the yard as are the permanent men. Clean by sweeps with two gangs, your two assistants, one in charge of each gang, passing up any considerable quantity of one kind.

You will find that this is the better way; that you are not compelled to always be cleaning; that Jack is not undoing to-day what Harry did yesterday.

A neat yard is a costly managed yard, a few sticks thrown in the gangway musses up a yard more than does a lot of five hundred feet in a fore and aft pile.

Try to have these two cleaning gangs number about enough men to keep them busy until the next cargo, information as to the probable time of arrival of which is a very important matter to the yard foreman, and of course makes for a small payroll.

Have weekly figures on the amount of lumber handled by the various departments and the cost of same—take them up seriatim, devote a whole lot of attention to one, study that department, make such necessary changes until you have greatly reduced the cost in that one department.

Then take up another branch of the work until you have established a cost price for handling in each department above which itmust not go.

If you keep this up you cannot fail to reduce the payroll, whereas by an attempt to work two many ends of the game at once you will overlook much that you can accomplish more by tact, judgment, practical methods and tactics which have no limit.

You may say I am making a mountain out of a mole-hill, that all such writings are purely theoretical, and that the above are just details that every lumberman knows, that it is easier to criticise than to originate and easier to tear down than to build. It is certain, however, that you will find some of these conditions in every yard; I found most of them in one yard.

The above are criticisms of specific methods and things (details of the business) small to the eye separately, voluminous on the whole, eloquent on the wrong side of the ledger, taken for granted on the right side, and to me the difference in coin of the realm lying on my desk would look like a mountain.—J. D. S. in the Pioneer Western Lumberman.

The Retail Business of To-Day

"The Retail Lumber Business of the Present," was the title of an interesting address recently delivered by W. C. Hickman, before the Southern Retail Lumber Dealers' Association, at Memphis, Tenn. Mr. Hickman's address, which was brief and practical, was as follows:

The retail lumber business of the present time is one of the best vocations a man could follow. I can see no reason why any man, it matters not who he might be, should not feel proud to be called a lumberman, either retail or wholesale. It is a great industry carried on by upright, honorable men, who do things—men whose words stand for something—men the world can depend upon. I am proud of the fact that I am associated with this great industry, even though in a small way, and I only hope that I will always be as well pleased with its workings as I am to-day.

Young Men's Openings

I know of no other line of work that offers better and more inducements to the young man than the retail lumber business, provided the young man has the proper amount of energy to stay with it. Most people, and especially young men, look upon our work as being below their calling, and most especially the retail end of the business. They seem to want to get into something easy where they can go dressed up while they work and they are particular about keeping their hands soft and white. But, Mr. President and fellow-lumbermen, you cannot handle lumber with soft hands and while wearing fine clothes.

Now we might ask a question, what does it take to make a successful lumberman?

First, he must not and cannot be what we term lazy.

Second, he must not be what you would call a "grouch," but to the contrary he should alweys wear a smile—the kind that won't come off. You know, Mr. Prisedent and gentlemen, that one little smile, followed by more later on, has changed many of our lives, and the good work is still going on. Why, if it had not been for that first smile I would not to-day be the happy married man that I am —so smile!

Third, I believe to be a successful retail lumberman, that you should familiarize yourself with the faces and names of your customers and when you meet them, it matters not where, give them the glad hand and make them feel that you are interested in their welfare more than to simply sell them a bill of lumber and get their money.

Fourth, for a man to be a successful retail lumberman, he must be a merchant—a merchant in the fullest sense. He must keep posted as to the market, and know the condition of his stock at all times. I wonder how many there are to-day here who have gone through their yards and found that they were out of the very kind of stock that was needed the most; and as you were making your way back to your office to look through your old files, thinking all the time just what you were going to write to the poor traveling man, or the head knocker at the main office—and then what? You would find that you had overlooked ordering that particular stock, although the salesman had been drumming you hard for orders.

Speaking of traveling men, God bless every one of them! I do not think that a retail lumber dealer could have a better asset than the good will of the men who call on him, looking for orders. They always bring sunshine and pleasure, and we should always greet them with open hands, even if they do make us pay for our lumber, and other stocks at times, like they are doing now.

We, as retail lumber dealers, have our friends and enemies—our friends are the manufacturers and wholesalers and their traveling representatives that sell through the legitimate channels of trade—the retail dealers. These friends we should cherish, for they are near and dear to us—without them we could do nothing; we should cooperate with them as much as possible by ordering our stocks far enough ahead so as not to cause them unnecessary expense and trouble in filling our orders.

The Mail Order Enemy

I believe that the greatest enemies we have are the unprincipled mail order concerns that strike at the very heart of our business and are trying to put the retail men in every line out of commission, for they know if they could only accomplish their purpose this whole country would be at their mercy and they would be made millionaires many times over, while we, the consumers, would suffer. But thanks to our association and the loyal men at its head, such conditions shall never exist without a fight, and it is going to be a fight to the finish.

Now the question arises, are we, each and every one, doing our part of this fighting, or are we standing idly by and looking to our association, through our officers, to do all the work? There is work for us all, and it doesn't necessarily have to be through the association.

I find from actual experience, if you have a friend that is a good friend, and, it is up to you to make him a good one, who is contemplating purchasing a bill of millwork, he will nine times in ten come to you before ordering from a mail orded house. In nearly every case he will bring along his mail order catalogue and you will find that he will willingly allow you a small percentage of profit and he will allow you the advantage of all doubt when it comes to figuring the freight charges. Of course, you would not expect a stranger to do this unless he were a very broad-minded man.

When it comes to meeting this mail order competition, you will find that legitimate wholesalers and their representatives are always ready and willing to strain an extra point to help you out. After you have sold your man, you will find that it is nearly always easy sailing to sell him the balance of his bill. I believe that all orders taken under such conditions should be shipped from the factory, so that your customer would have to wait the same as if he had ordered the goods himself, and also that you may get as much help as possible from the manufacturer or wholesaler.

Friendship and Business

I don't believe too much could be said, if said in the right way, about making friends out of our customers, and also prospective customers. We all feel that we would like to do this, but do we? No; as in other things, we allow ourselves to grow careless, and, in this way, I believe, we lose customers we could have had. Many times after speaking to an acquaintance, I have thought, "did I greet that man the same as I would if I had been expecting to sell him a bill of lumber or other material?"

Now what about our collections? I believe that this is a part of our business that we all neglect more or less and it is the most important part of the whole. If it were not for getting into trouble with Met L. Saley, I would bet $4 and my old black muley cow that nearly every lumber dealer here to-day has, while making strenuous effort to get new business, neglected collecting for that already sold and due as well as past due.

I believe that we ought to pay more attention to collecting our outstanding accounts and be less eager to underbid our competitor on bills we feel that justly belong to him and would go to him if he can make even as good a price as we can make.

Now don't understand me as advocating the elimination of honest competition, for such is not the case. Business would lose all its fascination if there were no competition—but I do hope to see and I believe we will all welcome the day, when we as retailers will have

Many Kinds of Side Lines

I will first take up the side lines we handle and tell why it looks plausible to me for handling them, says K. W. J. in the American Lumberman. Coal is one of our largest, and while it is not as profitable probably as it should be, still our biggest coal trade is done when other business is slack, and our time is not worth so much. Also, if we did not handle coal there is more chance for an opening for some new dealer, and the chances are if he put in coal there would not be enough business to justify him and he would get to dabbling in some of our other lines. Anyway, coal is a very nice side line with lumber, as it is all coarse work, and a great many times our customers want to load partly one thing and finish with something else and it saves them running all over town to load up.

Feed is another. While our grain business is very light, it is like the coal, keeping new men out, and helps the farmers dispose of their grain; besides we collect a good many accounts by buying grain that other wise would be very slow and possibly lost.

We have also sold several bills of lumber where the farmer was depending on his crop to pay for it, where as if we had not bought it he would probably not have built or looked elsewhere for his material.

We carry most everything that goes to build a house, thus saving the customer the trouble of going around and getting different things. We handle lumber, coal feed, cement, plaster, lath, posts, brick, sash and doors, steel siding, corrugated roofing, pumps, windmills and repairs for them, paints, oils, varnish, brushes, gasoline engines and feed choppers.

We aim to carry everything in our line that we have any sale for at all, even if it is a little slow about selling, such as steel siding and corrugated roofing. While we do not think they are the best, there are some who think they are all right; therefore we do so to accommodate our trade.

In pumps we have a special line, something good, which appeals to the trade as the right thing and is everything we claim for it. The wind mill trade in this locality is very good, but competition is cuch that it forces us to sell them at a very small margin. Although we get a good share of the wind mill trade, the repairs is the main object in handling, as there is a good profit in them, which is no more than right, taking slow sale into consideration.

The paint business is practically the same as wind mills, as there is too much competition, the only advantage being that paint is a very good advertising medium, as you can say more about it than anything else, thus keeping your name before the public, which is the main idea in advertising, anyhow. The paint concerns always send out so much advertising matter you get a good deal of advertising at very little cost.

We keep a gasoline engine and feed chopper set up ready for operation, and have the benefit of grinding our own feed, at the same time it being in good shape to show what it will do. In case we should sell one or both of them we would take them down and order new ones.

My observation is that general merchandise and lumber do not go well together, as two firms in this town some years ago tried handling them and they both got to bucking and cutting prices on lumber to get trade to come their way and deal on other commodities, so they found this uphill business and both sold their stock of lumber.

Advertising Side Lines

Handling side lines in connection with a retail lumber yard is a subject which bears discussion, and in which I am sure your readers will feel great interest.

What we have found to be our best side lines are cabinet mantels and composition roofing; the latter the most profitable, as it is taking the place of tin and shingles, which are becoming obsolete. Of course, there are natural side lines, such as lime, cement, paint, roofing, tile, firebrick, etc. Any of these can be handled profitably if pushed in the proper manner. Every side line should be thoroughly advertised. The trade in general know you handle lumber, but are not supposed to know the nature of your side lines. We make it a rule that every invoice or communication which leaves our office shall contain reading matter referring to one or each of the side lines we handle. We have, for instance, a stamp, which reads as follows: "We carry the finest line of Cabinet Mantels every shown in the city. Call and see them." This we use freely on all invoices, statements and letter heads. This assertion must, of course, be backed up by facts in the way of a nice mantel display. To do this you must have a place close to your office where ladies can be taken, and have a sample of each mantel set up complete—with hardware, tile, firebrick, etc.—just as it should appear after being set up for use. Remember that cleanliness goes a long way, therefore keep everything well dusted and free of all dirt, that it may add to the appearance and greatly facilitate the sale of same. Things shown to advantage and arranged artistically make ready sellers.

In the buying of roofing I would suggest that you buy sparingly at first, for the reason that it will not pay to handle any but the very best. No doubt many have stopped handling certain side lines, thinking the small sales did not justify the trouble and expense of it, when really their trouble arose through selling inferior grades. Many of our so-called drummer friends will give you a talk like this, each one telling the same old tale, which is about as follows: "That it will last for years, will stand any and all tests, contains no tar, is made of wool felt, therefore will not run or sag in summer and will stand any temperature or climate,etc." In fact, they lead you to believe it will last always. Therefore I advise that you buy in small lots from different factories, trying a sample of each on your own buildings, then select for handling the one that proves the most satisfactory. We tried this and have gotten thereby the agency for one of the most satisfactory roofings on the market. I mean by this, one that we can back up with a guaranty. Knowing from actual experience its lasting qualities, when selling roofing we always talk quality and not price. Side lines should be sold with the idea of making a permanent customer of the buyer instead of driving him away, as some do by selling cheap and inferior articles.

When we hear of a building that leaks or needs a new roof we go at once to the owner thereof and explain the merits of our roofing; if a sale is not consummated we at once write our factory as follows: "Mr. Blank will be in the market about blank date for blank squares of roofing." They at once write, giving necessary information, also enclosing a lot of advertising matter and referring him to us as their agent in his territory. We advertise on our envelopes in this way, across the address side at the bottom in large letters is the following: "We are agents for Blank Roofing." This we have found brings good results.

These same forms of advertising can, of course, be used for any side line; I simply quote mantels and roofing, as they are our sellers. —W. K. P. in the American Lumberman.

Camp Sanitation in British Columbia

With the appointment of Dr. Davis of Nanaimo, as inspector under the new legislation, a systematic and comprehensive campaign is to be initiated by British Columbia for the assurance of sanitary conditions in the railway construction, logging, lumbering, fishing and kindred camps throughout the province. As a result the general standard of life as well as the health of provincial workers in the woods and waste places is certain to be materially improved. Dr. Davis has just completed a thorough inspection of the camps of the Nanaimo district, and will remove to Victoria to establish official headquarters. That the new inspector is entering upon his duties with a clear idea of their importance and their requirements is evident from the rough draft of rules and regulations, to be made applicable to the various camps, which have just been submitted to the Acting-Premier Hon. Dr. Young, and read as follows:

"Regulations for the sanitary control of lumber, mining and other camps, sawmills and other industries situated in unorganized districts.

"1. Every employer of labor on any work in any lumbering, mining, construction or other camp, sawmill or other industry situated in any portion of an unorganized district, shall upon the establishment of each and every camp or work, forthwith notify the sanitary inspector of the province of the establishment of the same, and when requested, shall furnish such particulars as may be required by the said inspector.

"2. The owner, manager, agent or foreman of any lumber, mining or other camp, sawmill or other industry, located within an unorganized district, shall in connection with every such industry or works, be responsible for the execution and enforcement of any regulation herein contained, or hereafter to be adopted.

"3. If in the opinion of the sanitary inspector the site of any camp or works is unhealthy or unsanitary, he may order the removal of such camp or works to some other site to be selected by him.

"4. Any house, tent, or dwelling occupied by the employes engaged in any industry located within an unorganized district shall contain sufficient cubic feet of air space for every occupant thereof as may in each instance be deemed necessary by the sanitary inspector, and shall further be provided with efficient means of ventilation. The floor of every dwelling shall be constructed of boards or planks, or other material equally suitable for the purpose, raised on supports at least one foot from the ground and so made that it shall be tight. Every dwelling, other than a temporary tent, shall be lighted by windows so constructed that they can be opened when necessary.

"5. The method of ventilation of every dwelling in which a stove or furnace is used shall be such as will satisfy the sanitary inspector. The temperature of the room shall be maintained at from 60 to 65 degrees Fahr.; and a shallow pan supplied with water shall be kept on the stove to supply air moisture.

"6. Every camp or the works of every industry coming under these regulations shall be equipped with a wash-house or laundry containing a stove and tubs for bathing purposes.

"7. Every camp or works shall be supplied with a building or tent properly constructed and set apart as a kitchen and having a dining-room in connection therewith, with proper conveniences for the cleanliness and comfort of the employes.

"8. Proper receptacles must be kept on hand into which all refuse, whether liquid or solid, must be placed, and such refuse must be regularly destroyed by fire, or removed to a safe distance from any building, and be so deposited as not to create a nuisance or contaminate the drinking water.

"9. Latrines, earth or other closets must be located and constructed and maintained in a manner satisfactory to the said sanitary inspector.

"10. Stables in connection with any camp or works must be so located as not to contaminate the water supply, and must be not less than 125 feet distant from any dwelling or kitchen. This distance may be increased at the discretion of the sanitary inspector.

"11. Printed copies of these regulations may be obtained from the sanitary inspector.

"12. Should the sanitary inspector find that any of these regulations are not complied with, he may where necessary, take steps to enforce them, and the expense of such action shall be paid by the employer or his agent.

"13. The penalties contained and provided in Sec. 97 of the Health Act shall apply to the violation of any of these regulations.

"14. The water supply of any camp or works must be uncontaminated and obtained from a source satisfactory to the sanitary inspector.

"15. The sanitary inspector may, where deemed necessary, obtain the services of any provincial constable or constables to assist him in the performance of his duties and to aid in the enforcement of these regulations."

THE WOODWORKER

Box Factory Systems

By James Innes

In presenting this article I do not wish to infer that a set of rules or a system which is working admirably in one locality would be practical in every locality; neither do I wish to give the impression that because I operate a certain system in the factory of which I have charge, that I would attempt to carry out exactly the same system in another factory in a different locality.

There is a great difference in operating a box factory in connection with a sawmill for the same company that owns the mill, and operating a factory entirely separate from a sawmill. From one point of view I prefer the box factory operated by the same concern which saws the lumber, but looking at things in another light, I would prefer the factory operating independently. The reasons for these different views are too numerous to be gone into in detail, but I will give an example to help make my meaning clearer.

In the case of the mill company owning the box factory, there are times when the yard reports show quite an amount of cull lumber on hand, which could not possibly be sold at a rate which would pay the cost of manufacturing. This is the time when the box factory looks good to the mill company. By different operations through which this cull lumber is passed, each operation raising the grade, or, in other words, refining it, it is finally converted into boxes or box shooks, as the case may be, which, when sold, will bring in something like $18 or $20 per 1,000 feet, all depending on the kind of box it is worked into.

Some one will say: "Look at the cost of working it up." Sure thing! That is just exactly what I mean when I say that in looking at things from another point of view I would prefer operating a factory independently of the sawmill, in which case I would not buy this particular kind of lumber. Much could be said right here along this line, but as I do not wish to elongate this article, we will pass on to the actual work of getting out an order for milk boxes.

First of all, it will be well to consider the different order forms and tally cards used in connection with this order. Fig. 1 represents the form on which the order comes to the factory from the main office, a duplicate being kept in book form (loose leaf) in the main office. This form will need no explanation; a glance at it will show the advantages of such an order form.

Fig. 2 represents the yard foreman's tally card, on which he gives full data concerning the lumber piled in the yard each day. Fig. 3 is another card, which the yardman keeps straight, giving account of the lumber removed from the yard. Both cards are turned into the factory foreman at night, and he, in turn, transfers the information thereon contained onto a card arranged expressly for this purpose. Fig. 4.

These cards are kept in a box made especially for them, and each width and thickness of lumber shown on these cards is kept in a separate compartment, each compartment rising above the other somewhat like a set of stairs, thus giving access to any set of cards desired. This record is kept for each different kind of lumber in the yard, and gives data of piling, number of feet in pile, number of pile and number of road or cross-road upon which it is piled. The reason for keeping this record of lumber will be clear when it is shown that the foreman must choose the pile to be used in connection with each order being run, and give pile and road number on the yard ticket when ordering in lumber for the various kinds of much the same as the streets and avenues in cities, each road or cross-road being numbered in large figures, and each pile being numbered on the same principle as city houses are numbered, it is quite boxes.

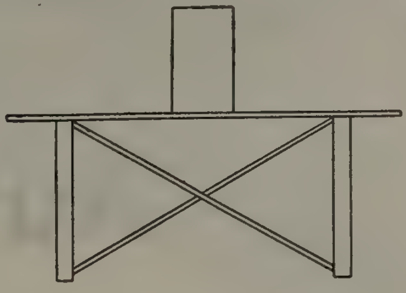

Fig. 7

Fig. 8

Fig. 9

The yard ticket is shown in Fig. 5. The upper half of this ticket calls for a given quantity of lumber from a certain pile on some particular road, and as the yard is laid out in roads and cross-roads, a simple matter for any one to get the right pile.

When the lumber is loaded, a tally is given on the bottom half of the yard ticket, the loading being done by contract per 1,000 feet. This tally is turned into the office for comparison with the planer meter tally given on bottom half of planer and cut-off order—Fig. 6. A glance at Fig. 6 will show how the planer, cut-off and resaw orders are made out, the letters "R. S." meaning to resaw; and if resawing is not required, the letters "R. S." are marked out.

It may be advantageous at this point to give the cutting sizes of this milk box, in order that the various operations may be more readily followed:

Ends, 12⅛ x 9⅜ x 13-16.
Sides, 20 x 9⅜ x ⅜.
Tops, 20 x 12⅞ x ⅜—must be one piece.
Bottoms, 20 x 12⅞ x ⅜—can be two or three pieces matched.

This is a very simple box to make, and that is the reason I have selected it as an example. We will take each step in the manufacturing of this box, separately, in order that it may be more easily followed.

Tops.—The tops for this box are made out of 1 x 13 in. lumber, dressed 12⅞ x 13-16 in. on planer and passed to "tumble-over" cut-off saws. The cut-off sawyer cuts them to length, keeping the splits separate from the good cuts, and passes both along to the band resaw. The reason for running the tops first is that the splits can be worked into bottoms while balance of order is being run through planer.

The resawyer resaws the tops into two equal pieces, and they are baled up right at the resaw, loaded on trucks and sent to the

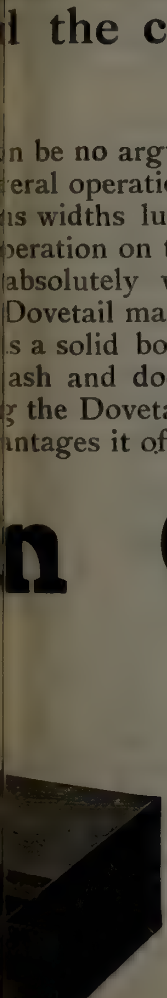
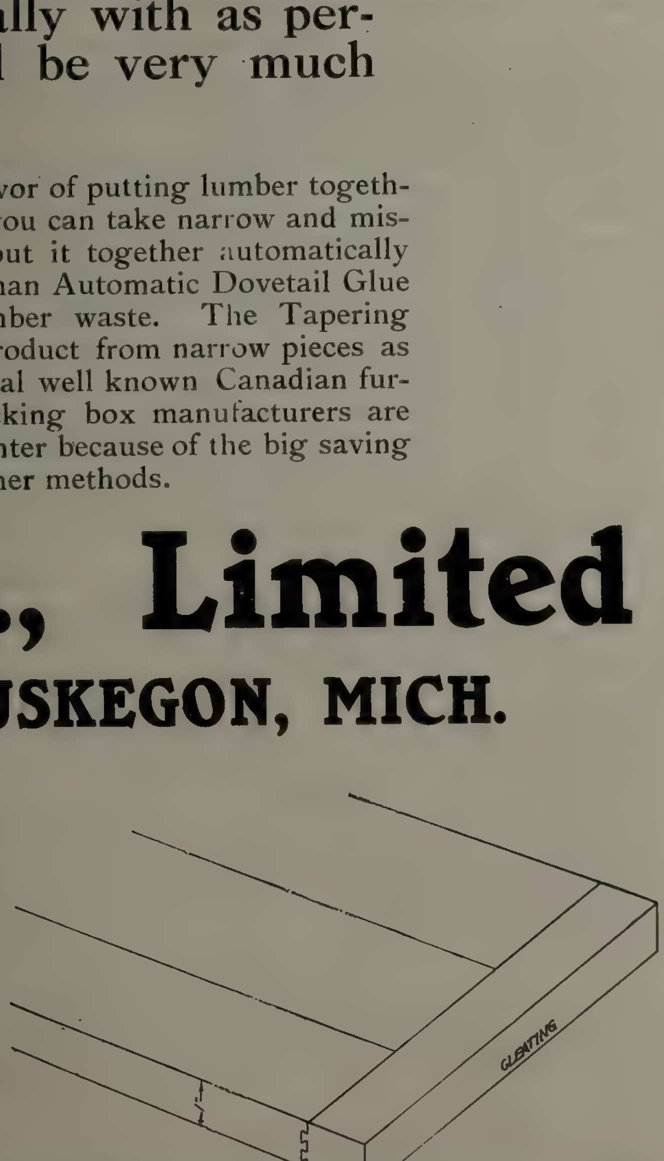
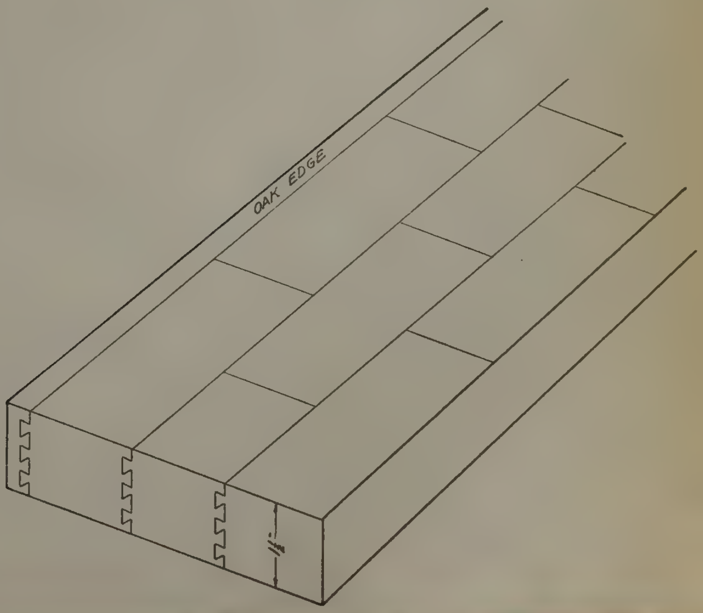
FLUSH ON THE BOTTOM

n Co., Limited

MUSKEGON, MICH.







warehouse, where the shipper takes charge of them. The splits are resawn and sent to the rip saws, to be ripped into two or three-piece bottoms, and sent to the matcher.

Sides and Ends.—Sides are made from 1 x 10 in. lumber, dressed 9⅜ x 13-16, cut to length, resaws, loaded on trucks and sent to the nailing machines. The ends are made from the same lumber and are obtained by cutting between knots and out of the butt ends of the boards while cutting sides. If the cut-off sawyer does not get the required amount in this manner, he cuts enough from the last truckload of lumber which comes to the planed to fill his order. The ends are piled on trucks at the cut-off saw and sent direct to the printer. After printing, the ends are sent to the nailing machines, and by this time the bottoms will have commenced coming from the matcher, thus enabling the nailers to start nailing. After nailing, the boxes are piled in the warehouse for shipment.

Now, in case this order had been for shooks instead of made-up boxes, the mode of procedure would have been the same, except that the sides would have been baled at the resaw, the ends at the printer and the bottoms after matching.

The method of baling may prove interesting to some, although I feel certain there must be some better way of doing it, could I only find it. The baling bench is made like Fig. 7. There is nothing intricate about it, just as long as it is a comfartable height for working and wide enough to hold the stock to be baled. The bottom is made of three pieces running full length, with spaces about 8 inches between each piece, to allow the wire to pass around the bale. The wire is looped at one end and cut to length—Fig. 8—this looping and cutting being done quite rapidly on a contrivance made for that purpose. The wire is placed around the bale when on the baling bench, the small end is passed through the loop and is drawn very tight with a wire twister—Fig. 9. This tool is made from a piece of ⅜ round iron, with a hack saw cut in the long end large enough to receive the largest gauge wire being used. The split end is casehardened, to prevent the constant twisting of the wire from wearing it out.

It will be seen that by this method of baling it is a simple matter to move the baling benches to any part of the factory when required, which is a great advantage over some methods now in use, where all stock to be baled has to be taken to some particular place in the factory.

After the shocks have been sent to the warehouse, the shipper sends them to their destination, accompanied by a manifest—Fig. 10—a duplicate of which is kept on file for reference. This method is excellent in case of disputes or claims for shortage, as it shows exactly what was shipped, when shipped, size of pieces and number of pieces in a bale.

The box business is an interesting one, and, if gone into in detail, would make a large volume. I think, however, enough has been said to give those not thoroughly acquainted with the business an idea of how it is done—The Woodworker.

Use and Treatment of Veneer Knives and Saws

By R. J. Cant

The semi-annual meeting of the National Veneer & Panel Manufacturers' Association, was held at Chicago on June 13, and one of the most interesting addresses delivered was upon the subject of the treatment of veneer knives and saws, by R. J. Cant. Mr. Cant's remarks were as follows:—

Veneer knives and saws are items of considerable expense to the manufacturer of high grade veneers.

This expense, of course, varies with the degree of care either may receive in the hands of the employees, whose duties require them to grind and prepare them for the machine operator.

Veneer knives are made in various sizes from one to sixteen feet in length, and are usually of laid steel, or of tool steel, which has been forged to low grade steel, the object of which is to produce a finished knife that will remain straight, without warp or wind, as would be the case if made wholly of tool steel.

Tool steel has a well known tendency to contract and buckle in the process of tempering, hence the desirability of producing knives in this manner, so that they may be readily straightened in making and afterwards. Much of the unfortunate troubles experienced in grinding are overcome by the use of this softer steel in the backing, but enough trouble remains to continue to annoy the veneer maker. The methods pursued and materials used in a modern knife factory are of such a nature that perfect knives can be guaranteed of much superior quality and far better finish than ever before.

Many consumers of machine knives evidently are not aware of the great amount of work required, nor the years of experience devoted to the veneer man's peculiar needs, necessitating the employment of many expert mechanics of years of education, together with a careful selection of high-grade finishing machines, to enable the knife man to insure satisfaction to a critical class of manufacturers.

A straight knife, of well welded steel and with a temper suitable to the character of the work, is absolutely essential, and the absence of either of these qualities, even in a modified degree, will result in subsequent trouble.

Knives Ruined by Grinding

In ordering knives the veneer maker should always state the character of the work they will be used for.

A recent writer has truly said: "The man at the knife grinder cannot change a poor knife into a good one, no matter how much skill or care is exercised, but when the skill and care are lacking it is very easy to change a good knife into a bad one."

So many knives have been injured and ruined in the operation of grinding through carelessness, ignorance or worse, that possibly some information along this line may prove interesting.

Grinding the thin edge of an expensive veneer knife is indeed a delicate operation and requires an order of skill that many veneer makers do not seem to appreciate.

It is possible to overheat, burn or crack any veneer knife, in this operation, in such a short period of time that it seems incredible. Few realize that but the fraction of a second is required to do the harm that renders many otherwise perfect knives useless through the drawing of the temper or by cracking. Several kinds of artificial grinding wheels are being made for this work, some of which are of excellent quality, but others are quite unsuited to the work and cause trouble.

Turkish emery was among the first abrasives tried, but it being of rather soft nature indicated that it was undesirable, and it is also true that some abrasive materials are either too hard or are unsuited for the grinding of tempered tool steel, in view of its great liability to overheat the work. Much experimenting with various forms of abrasives, with different processes employed in the manufacture of artificial grinding wheels, seems to indicate that the safest and therefore the best abrasive to be pure corundum, a natural product found in its purest state in Canada, containing 95 per cent. of crystalline alumina, which is the ingredient that does the cutting, and this percentage is by far the greatest found in any abrasive.

Skilled Labor Needed

The manufacturers of artificial grinding wheels have made great progress in perfecting them, and wheels of the present day are far superior to those of former times.

It should not be construed, however, that this advance in the science has reached the point where grinding of expensive veneer knives and saws may be accomplished by unskilled labor without fear of injury.

Wheels which prove most satisfactory and serviceable are those in which the abrasive grains are known as size No. 30 and the grade, or bond, is J or K.

The most satisfactory bond is that which retains the service of each individual grain for just so long as it continues to cut, but releases it at that moment it has grown so dull that it refuses to perform its function and becomes an increasing danger through friction.

This is precisely what a hard wheel does, owing to the hardness of the bond, it retains its hold on the grain after it has served its usefulness, with a tenacity that frequently nothing but an emery wheel dresser will dislodge.

Ordinary grindstones have been used with safety, but cannot be relied on to run true and are not recommended for this work.

The use of plenty of water is of benefit, yes, a necessity, in grinding, but the lack of it altogether is less serious than the poor economy of allowing a scanty stream of water to trickle down on an overheated blade, where the laws of contraction and expansion are very apt and often cause it to take advantage of this opportunity to crack or snap, in this case the quantity of water used being too little to serve its intended purpose of cooling, by being allowed to run on the blade when it is in a heated condition.

The longer the bevel is ground the greater the danger, as thin tool steel is very easily overheated, and knives ground in this manner are not recommended, nor are they guaranteed by the knife manufacturer.

Care of Knives for Veneers

Face grinding should not be attempted by unskilled persons, nor should it be done to such an extent that the value of the temper is lost by cutting through it into the softer structure of the interior of the steel.

Fine veneers cannot be cut with a poorly tempered or poorly ground knife, but fortunately it is not necessary to use them, as excellent veneer knives may be had from well-known makers, who are willing to guarantee satisfaction.

To cut veneer of uniform quality and thickness it is necessary to use a uniform tempered, accurately ground knife, which must be ground with care on an automatic knife grinder, that is rigid and where the knife is firmly bolted to a stationary solid frame that is incapable of any spring, then permit the grinding wheel to travel back and forth, taking but a very light cut, which is covered with a liberal stream of running water, ever remembering the maxim that "haste makes waste."

Occasionally a knife that seems a little hard at first will, after being ground the first time, prove satisfactory and hold a good edge thereafter.

Knives that have been used and ground two or three times and seem to be working all right, will continue to do so until they are worn out and subsequent troubles are in nearly all cases traceable to inexperienced or unskilled labor and handling, for which no fault can be attached to the tool or its maker.

Among the defects that may be noted in veneer knives are poor welding, uneven grinding, unsuitable or uneven temper, errors in location of slots and poor joints in the case of sectional knives.

A poor weld of but an inch or two rarely causes trouble and can be safely used, but if several inches long may give trouble through slivers working into the opening, forcing the tool steel away from the backing and out of line, possibly spoiling the blade for future use.

It is important that it should be ground straight and true, especially on the face or steel size, not permitting hollows or high spots to remain, which result in uneven cutting edge and interfere with the successful operation of the pressure bar.

A Bad Feature of Veneer Cutting

A few sectional veneer knives have been used which are joined together with a key or lock, but there is a limited demand for them which indicates that they are not altogether satisfactory in view of the difficulty of making perfect joints, the great liability for the sharp corners to break at that point and the very little saved in the total cost of such work.

Many knives are ruined from coming in contact with metal imbedded in the wood, one of the bugbears of the veneer man's work, one of the worst features being the finding of fragments of shells forced into the tree in the days of the Civil War in the South.

Spikes, iron stakes and other substances, including bullets, are frequently met with, although the latter cause no trouble unless they may have been steel capped.

Veneer is used for a great many purposes, among which may be noted rotary and sliced for furniture and desk work, sliced for cigar box stock and thin stock for barrels, crates, boxes and to pack meats and bottled goods for shipping.

Merchantable veneer is cut as thin as 150 to the inch and in all sizes up to three-eighths of an inch thick, sound and good.

As might be expected, one grade of temper would not be suitable for all such work, hence it is necessary for the knife man to have intimate knowledge of the work to be done to enable him to determine what degree of temper would be best suited to the case.

One of the knife man's greatest trials is in connection with complaints from customers, who stoutly maintain that knives could not have been overheated or injured at their factory, as "the same man and the same grinder had ground many knives without injury for years," but it is the exception that proves the rule, and the fact remains, that anyone can burn any knife, on any grinding machine, with any grade of abrasive wheel, no matter how experienced they may be.

Segment Veneer Saws

It is not necessary to burn knives frequently to prove such a contingency exists, or that the best of mechanics may err occasionally.

It is fair to say in this connection that the knife man is more sinned against than sinning.

Segment veneer saws are used in sizes varying from 64 to 84 inches in diameter, each segment being firmly screwed to a steel flange, with spacing of about one-sixteenth of an inch between each.

These segments are ground with a bevel for about four inches in depth, back from the rim or teeth, slightly concaved, with this side of the saw set to the outside, or away from the stock being cut.

Points are usually spaced at three-fourths of an inch, with a peculiar pattern tooth, to give the best results, in what is probably the most delicate operation attempted with a circular saw.

Segments at the rim should be pretty stiff and ground with care to insure a straight and true surface on the flat side, beveled down to about 24 gauge at the points for economical cutting.

Sawyers use but a slight set, and that only for a fraction of an inch back from saw points.

It is absolutely essential that segments be ground of uniform thickness and lined up so that each fit exactly in line on the flange, with a set that is adjusted to a nicety, with all teeth cutting equally, avoiding high points, which result in torn or scratched veneer.

It is customary to remove segments about once a month, returning them to the saw maker for rebeveling and adjustment.

This class of saws are usually filed by hand without removal of the segments from the flange or saw from its arbor, which method removes the possibility to overheating, which grinders of the knives experience.

Shavings Packing Under Knives

Nearly every one has from time to time seen shavings pack under knives, but recently was the first time I have ever seen it cause any material damage. According to the evidence of the lumber that was passing through at the time, one of the knives started to pack, and in the time that the piece was passing through 8-in., was forced out enough to cut the board ¼-in. thinner than the normal cut, before it gave way. Happily, only about half of the knife came off, and it wedged between the cylinder and pressurebar, stopping the head without doing any material damage. Outside of battering the lips of the cylinder a little and springing the shoe from the chip-breaker, the machine sustained no damage whatever. It is peculiar, though, the celerity with which the normal man can sidestep behind the nearest convenient thing when such an incident occurs.—C. H., in the Woodworker.

Home-made Power Lathe

While in a furniture factory some time ago my attention was called to a home-made lathe for turning up table pedestals, says a writer in the Woodworker. It was an ordinary hand lathe, with a mandrel mounted on a frame anchored to the lathe bench, on which the cutterheads were set. Cutters were strung the entire length of the stick to be turned. The mandrel was set on a movable carriage arranged with a screw cross-feed for feeding up to the work. The mandrel was belted at both ends from a shaft directly overhead, so that the movement in traveling up to the work would not affect the length of the belts.

There are special machines for doing this work, which, of course, are the best, but this rig seemed to work nicely, and might be justifiable where the quantity of work is not sufficient to warrant a more expensive machine.

In nearly every factory there is to be found some contrivance for doing some operation peculiar to their work, more or less ingenuously arranged

---

The Lumbering Industry in Rimouski District

In reviewing the general business situation of the district of Rimouski, Que., especially in its connection with the export trade, it should be borne in mind that practically all of the commercial interests of the district centre upon the product of the forest, says U. S. Consul Ryder, in a report to his government.

The logical market for the lumber produced by the mills in this district is New England. When the demand for this product is curtailed in that market a wave of business depression sweeps over this part of the province as a natural result.

An effort has been made on the part of the lumber manufacturers to overcome this condition by reaching out for other foreign markets, and the results were favorable last season, when several large cargoes were consigned to dealers in Spain, Portugal, Brazil, and Argentina. These shipments, in connection with those made to British ports, aggregated nearly 40,000,000 feet of lumber consisting principally of 1, 2, and 3-inch spruce of varying lengths.

Lumber required for British and other foreign markets is simply sawed to thickness and otherwise unmanufactured, while the American markets call for a specially prepared product. The lumber is first critically culled, carefully piled, and covered for thorough protection during the process of wind drying, where it is frequently kept for a year before being placed in the kiln for final drying, preparatory to being further manufactured; several of the mills having installed the latest improved American machinery for this purpose, frequently replacing a machine which has been in use but a short time for a later model that will turn out a better grade of work at increased speed, with a corresponding saving in the item of labor.

The lumber cut for 1910 appears to have been a satisfactory one, the mills running continuously, completely clearing up all the logs before the season closed. The demand, however, was not equal to the supply and in consequence there was a large accumulation in the yards. This was particularly the case with shingles.

The most extensive corporation operating in the export lumber trade in this district is preparing for a more aggressive business campaign; the company has been reorganized and a bond issue of $5,000,000 successfully subscribed in London; new mills and needed improvements are to be added with the intention of entering more actively into the manufacture of paper, in connection with its lumber, pulp-wood, and wood-pulp interests.

The limited railroad facilities seriously hamper shipments to the United States. Orders for hundreds of carloads of lumber, ties, and shingles have been cancelled because shippers were unable to secure cars for handling the business.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

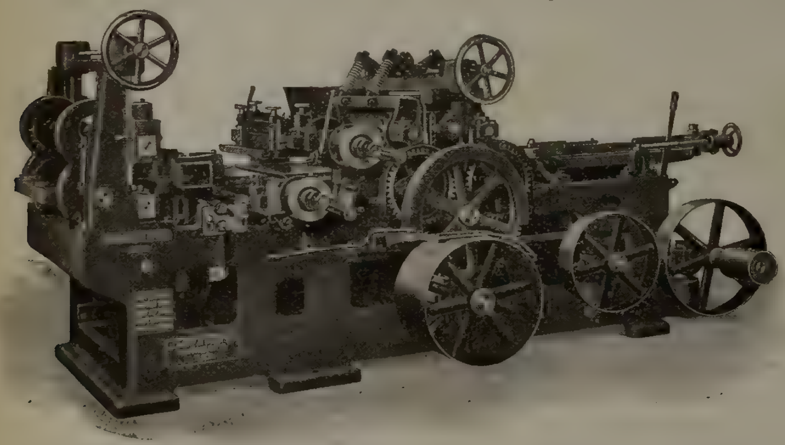
Efficiency in the Planing Mill

"Increase the efficiency of your shop." This is the modern business slogan. It applies to all lines of industry, but more especially to the planing mill.

The up-to-date planing mill foreman, while realizing the value of "speedy bosses," "time tests," etc., at the same time knows that a modern planing mill tool will do more to increase the quality and decrease the cost of his products than any of those theoretical ideas.

A planing mill tool to come under the "high efficiency" designation must be constructed so that it can be used to full capacity all day long. At the high speeds at which the recent models are operated, they will in a few hours' time turn out enough of one kind of stock to run a shop for some time. It is necessary therefore that a general planing mill tool be capable of doing a variety of work, in other words, taking the place of several machines and the extra operators.

A machine designed along these lines is the J. A Fay & Egan Co. No. 275 planer and matcher illustrated herewith. This is one of the late productions from the works of J. A. Fay & Egan Co. at 465-485 W. Front street, Cincinnati, Ohio. Primarily it is designed for all kinds of planing and matching up to 24 in. wide and 8 in. thick, but its use is not ended when it has done this work. A few turns with a wrench draws the side heads away and the machine is a double surfacer; run the heads in close, change the cutters and it is a first-class floorer. Last, but not least, molding knives can be substituted for the palin and matching bits and the machine becomes a high duty inside moulder. The arrangements for making these changes are very simple, so that no time is lost in this way.



J. A. Fay & Egan, No. 275 Double Cylinder Planer and Matcher.

The frame of the machine is made on the "open type," giving quick and easy access to all working parts.

The cylinders are made from solid crucible steel forgings, four sided and slotted, or, when ordered, the new Fay & Egan patented circular heads, fitted with high duty "Tungsten" steel knives and attachments for grinding and truing without removing the cylinders from the machine.

Both cylinders are provided with take-up for end motion when cutting moldings. Upper cylinder bearings are rigidly yoked together and are raised and lowered on powerful square threaded screws mounted on ball bearings. The lower cylinder is vertically adjustable and with the bar after the cut, draws out at the side of the machine, a great convenience in sharpening and setting the knives when the grinding and truing attachments are not used.

The feed consists of four or six double geared feed rolls. Only heavy pitched gears are used and all are keyed to the shafts, studs being eliminated entirely.

The entire construction is upon machine tool principles, so that the machine will stand up to hard work day after day, at the lowest operating costs, especially in the matter of power consumed.

This and many other special planing mill tools of the high efficiency type are shown in the manufacturers' planing mill catalogue—a copy of which will be sent free, charges prepaid, to any interested planing mill man upon application to J. A. Fay & Egan Co., 465-485 W. Front street, Cincinnati, Ohio.

A Hot Weather Souvenir

The Simonds Saw Company, of Fitsburg, Pa., have favored their friends with a unique summer souvenir in the form of a cigar fan. A dozen of these in a box, looking at first glance like a doxen pleasant smokes, turned out to be a dozen folding fans, with the Simonds name upon the folds.

R. Hoe & Company's New Chisel-Bit Catalogue

R. Hoe & Co., 504-520 Grand street, New York, have issued a catalogue of their chisel-bits in a useful booklet form. R. Hoe & Company were estiblished in 1828, and have enjoyed during the intervening years an unexcelled reputation for the production of goods of excellent quality. They have prepared this catalogue booklet to assist their customers when ordering. It will certainly be a help to those who wish to select from the large variety of chisel-bits manufactured by this company.

A. J. Burton Saw Company Open Ottawa Office

The A. J. Burton Saw Company, Vancouver, B.C., have recently opened an office at Ottawa, Ont., to handle their business in eastern Canada, which has increased greatly of late. The company report that their patent inserted tooth saws, bits and shanks are now successfully running in mills all the way from Cape Breton, N.S., to Prince Rupert, B.C. They report also that if their Ottawa branch meets with the success that they anticipate, it will be only a matter of time before they will establish a factory in one of the eastern provinces.

Catalogue of Sterling Exhausters

The Sterling Blower Company, Hartford, Conn., have issued an interesting new catalogue of their exhausters. The catalogue is attractively prepared and profusely illustrated. The exhausters manufactured by this company are the results of years of experience. In comparative tests by electrical engineers of integrity, the company claim that they have shown higher efficiency; ranging from 10 to 25 per cent., than other exhausters. The catalogue should be of considerable interest to all who have use for exhausters in their manufacturing plant.

A. E. White will Manufacture Swages in Canada

An interesting visitor at the office of the Canada Lumberman recently was Mr. A. E. White, of the A. E. White Machine Works, Eau Claire, Wis. This company is well known as the manufacturer of the "Champion" saw swages, swage shapers, and special tools for the care of mill saws. Mr. White is in Canada looking into the feasibility of establishing a factory in this country for the manufacture of his swages. He took out Canadian patents some time ago, and to protect them, the law requires him within a certain period to manufacture the articles in Canada. He intends to do this at once and is considering Ottawa as a location for the proposed plant. He will do a good deal of the manufacturing in the United States for a short time and assemble the parts and do the finishing in Canada. As soon as he has been able to sum up the prospects in Canada he intends to manufacture the swages here, completely, so as to save the thirty per cent. duty and the long freight haul.

New Methods Worth Investigating

Have you ever noticed the way in which some men receive a suggestion from a fellow-workman? There are some who always take a suggestion, no matter in how innocent a spirit it is offered, as a personal reflection on their own knowledge. It is a little strange when you stop to think of it, why this should be. Nearly every one is anxious to do his work in the best and quickest way he knows, and what if some one else does put you onto the kink that makes it easy? If there were no interchange of ideas among the woodworking fraternity there would be but little advance, because the improvements that are developed from time to time would become merely local ones. While it does not pay to adopt everything that comes along, still it is always wise to investigate the new methods that are called to your attention from time to time. Otherwise you are liable to miss some of the short cuts for doing more and quicker, as well as better, work, which is generally reflected in the pay envelope of the man who causes the saving.—The Woodworker.

Putting off work till to-morrow, and hypothecating to-morrow's wages, is making a sight draft on the poorhouse or the penitentiary.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

Axles Wanted

Wanted to buy wagon axles. Jackson Wagon Company, Limited, St. George, Ontario. 12-13

White Pine to Order

Wanted to correspond with parties able to cut White Pine to order. H. V. Berry, Fort Plain, N. Y. 12-13

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Tank Lumber Wanted

We require 2-in. and 3-in. Tank White Pine, 6-in., 7-in., 8-in. and 10-in.; 10 ft. to 24 ft. Also red pine. Highest prices for Pump Squares. Ontario Wind Engine & Pump Co., Ltd., Toronto, Ont. 7-tf.

FOR SALE—LUMBER, ETC.

For Sale

Product of two million feet of good white pine logs, rail or water shipment from Bruce Mines. Apply Bruce Mines Saw Mill Company, Limited, Bruce Mines, Ont. 11-14

For Sale

Two cars 3 x 6 12-16 No. 1 Spruce.
One car 4 x 6 and 8 12-16 Spruce.
Freight rate to Toronto, 13 cents.

New and Second Hand Machinery For Sale

AT HUNTSVILLE

One Northy (secondhand) "Duplex" Steam Pump, 3½ x 2½ x 4.

One secondhand Circular Saw Grinder "Colville Patent," good as new, built by The Wm. Hamilton Company, Peterboro.

One secondhand Upright Boiler, engine attached, 20 h.p. Boiler tested to 160 lbs. C. W. pressure.

One Steam Oil Separator, 8-in. pipe. McEachren make.

One Iron Saw Frame and Mandrel complete with pulleys and third bearing. Steel Mandrel, 3 7-16 diam. Waterous make.

One Dry Kiln in four bands of pipe. Steel jacketed with 5 ft. Fan Shaft. Bearings and Pulley. Back pressure valve and steam trap. Over 4,500 ft. lin. piping in the four banks in addition to bases.

One new three saw Edger. Steel Mandrel 2 7-16, with three bearings open end, for 16-in. saws, including Table Rollers and Shifter Irons.

THE HUNTSVILLE SYNDICATE,
11-14 Huntsville, Ont.

FOR SALE

Small Band Sawmill, Waterous make, complete with filing room tools, and Gang Edger, Live Rolls, Slab Slasher, Shingle Machinery, Shafting Gearing, Etc., also, Dynamo and Motor. Also a large number of factory Machines, comprising Matchers, Moulder, Band Rip Saw, Variety Saw, End Matcher, Shafting, Belting, Shaving Exhauster and Pipes, Dry Kiln with Steel Cars, Engine and Boiler, Etc.
2-tf. JOHN FINDLAY, Owen Sound.

WANTED—EMPLOYEES

Advertisements under this Heading two cents a word per insertion. Minimum charge 50 cents

WANTED—By wholesale lumber firm, bookkeeper and stenographer, one who understands lumber and can sell it. Box 290 Canada Lumberman, Toronto, Ont. 13-13

Wanted

By wholesale lumber office, bookkeeper, and all-round man. Must have experience. Apply Box 286, Canada Lumberman & Woodworker, Toronto, Ont. 12-13

WANTED—Good man with Portable Saw Mill to cut out one million feet. Commerce September 1st. Can give several years contract. Money advanced as work progresses. Apply Box 275, Canada Lumberman, Toronto, Ont. 11-14

WANTED—Planing Mill Foreman, thoroughly understanding machinery and getting out material for the city retail trade, in hard and soft woods. A first-class man only wanted. State rererences, wages, to Box 289 Canada Lumberman, Toronto, Ont. 13-13

WANTED—EMPLOYMENT

Advetisements unde this heading one cent a word per insertion. Box No. ten cents extra. Minimum charge 25 cents

WANTED—Position, Quebec Culler, or shipper of long lumber, for season, or longer. Good references. State wages and particulars. Gray, Cabano, Temiscouata County, Quebec. 13-13

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

Position Wanted

Position as salesman with manufacturing company by young man of ten years' experience in wholesale and manufacturing lumber business. Four years as travelling salesman. At present employed but desirous of changing. Box 280 Canada Lumberman & Woodworker, Toronto, Ont. 12-13

BUSINESS OPPORTUNITIES

Man with shingle mill and timber wants competent partner with small capital. Box 70, Thessalon, Ont. 11-14

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

Timber and Land Investment

Farm of three hundred acres within 35 miles of Toronto—one hundred acres of which is timber land—Pine, red and white Oak, Maple, Beech, Basswood, etc. Balance of farm is under cultivation, thirteen acres bearing apple orchard. Buildings cost over five thousand. Price, $29,000. Box 160, Canada Lumberman, Toronto, Ont. t.f.

For Sale

Saw Mill of 30 to 35 M. feet daily capacity, complete with engine, two boilers and lath machinery. For particulars write to E. D. Croden, Box 596, North Bay, Ont. 8-tf.

For Sale

Forty h.p. portable swamill, new, and 500 acres of timber, also large quantity can be cut adjacent to mill, price $2,500 if sold at once. D. A. McKellar, Parry Sound, Ont. 13-13

Representative Wanted

United States firm manufacturing saw and lath mill and special machinery desires to secure Canadian representatives. Can put right firms in touch with a lot of prospective buyers in Canada. Apply to Box 285, Canada Lumberman, Toronto, Ont. 12-13

MISCELLANEOUS

A Valuable Timber Limit for Sale

Timber Berth 1199, containing about one hundred million feet, principally spruce, of a very superior quality, well situated for economic handling. A railroad is under construction which will pass within one mile of this limit. There is big money in this proposition for the right party. Easy terms for payment. For further particulars apply to Room 1, Archibald Building, Edmonton, Alta. 10-13

Grease in Steam Boilers

It is now generally admitted that the presence of grease in boilers is highly deleterious, as, in conjunction with the limy deposits usually found to a greater or less extent in the feed waters, it forms a slimy coating on the boiler plates which prevents the rapid transmission of the heat, and consequently leads to overheating, bulging and distortion of the plates, and other accidents. The grease used for cylinder lubrication usually gets into the boiler through the medium of the feed water—more especially in cases where the exhaust steam is discharged directly into the feedwater tank or where surface condensers are used, and the water is constantly returned to the boiler. In these cases a gradual accumulation of grease in the boiler is bound to occur unless effective measures are taken to prevent it.

In recent practice, to prevent grease getting into the feed water a plan now often pursued is to raise the temperature of the water by means of a separate heater, and utilize the exhaust steam for heating or other purposes, so that it does not come in contact with the feed water at all.

Another and very general method of removing grease which has met with considerable success is to fix a separator in the exhaust pipe.

Various methods of filtration of the feed water also used with more or lesss uccess, but the consensus of opinion appears to be in favor of a mechanical separator acting on the exhaust steam but each case should be judged on its merits.

In minimising the amount of grease passing into the exhaust no more oil should be used for cylinder lubrication than is absolutely necessary, and a high grade mineral can be recommended for this purpose. Animal oils or tallow are objectionable, as they readily decompose and form fatty acids which, in addition, act deleterious on the boiler plates.

The Thinnest Veneer Made

The thinnest veneer made in commercial quantities and in a general commercial way is the veneer made from Spanish cedar into stock for veneering cigar boxes. There is used in the United States approximately five million feet of Spanish cedar annually for the making of cigar-box lumber andci gar-box veneer. Approximately half a million feet of this is cut into veneer, of which it takes 100 sheets to measure an inch in thickness. Some of it is cut even into 110 sheets to an inch.

Even what is called the thicker cigar-box lumber is as thin as the average thickness in veneer. About a million feet of Spanish cedar per year is cut into ⅛ in. in thickness and between a quarter and a half a million is cut 3-16 in. These are the standard thicknesses for cigar-box lumber, taking the industry as a whole. When it comes down to the real thin stock this is getting it down pretty fine, and this thin stock in veneer cut 100 and 110 to the inch is used for covering poplar and gum cigar box lumber so as to make it have the appearance and some of the aroma of Spanish cedar. The finished stock then is about ⅛ or 3-16 in. in thickness. No big hydraulic presses are used for this veneering eather. The veneer is simply spread and brushed out, and the stock piled up one on top of the other to dry.

On Feeding Steam Boilers

To economically work steam boilers care should be taken that the feed water is pure and hot before it is allowed to enter the boiler. The feed should be regular and continuous, and the water level be kept practically constant. This can usually be done by adjusting the feed pump valves so as to give a small but continuous supply of water, but only sufficient to keep the water level steady. Considerable fluctuations in the water level are the reverse of economical. In the best practice feed-water heaters or economisers are now almost universally employed, and no doubt exercise a very considerable influence, not only by supplying the feed-water hot, but by relieving the boiler from the undue strain set up by the admission of cold water. A relief valve should be fitted to the feed pipe, so arranged that should the pressure in the feed pipe be above that in the boiler the surplus water is automatically returned to the feed tank. Be sure that the feed pipe and valves are kept free from incrustation.

Artifically Dried Timber

In these days when artificial drying is largely practised, the quality of the planed goods turned out is often not so good as it was in the days of natural seasoning, and planed boards with the grain torn up or the surface wavy are often met with. In many cases this doubtless arises from passing the wood through the machine too soon after it leaves the drying kiln. It should in all cases be left or at least seven days to the influence of natural air currents in the open to temper and get rid of the various strains set up by the artificial drying. This tempering is particularly necessary where the wood is afterwards jointed and put together in the form of joinery or cabinet work, otherwise it is very likely to swell or warp. Of course, if the wood can be left in the open for several weeks, so much the better, as its hardened surface thus becomes naturally tempered, is more easily dressed, and leaves a better finish.

Statistics indicate that of the whole quantity of boxes made in the United States—based on the surface measure of the material of which they are made—approximately 90.6 per cent. are wood and 9.4 per cent. fibre. A comparison of the amount of lumber reported for boxes by the box manufacturers in 1907 for the whole country, and the quantity calculated two years later after a careful canvass of six States, indicates that the wooden box is not quite holding its ground.

Review of Current Trade Conditions

Ontario

There is little or nothing of interest to report in connection with trade conditions in Ontario during the past fortnight. In Eastern Ontario, travelers still find business very dull with only a few local indications of any improvement. In Western Ontario the reports are a little more promising. At Hamilton, trade continues very busy. The building trade there is very active. The same is the case at Newmarket and Aurora. Generally speaking, however, trade is only fair and dragging and dealers who succeed in securing orders have to go after them very actively. At Ottawa although business is good, there is a great scarcity of cars for shipment and the trade is badly hampered by it. One firm in the Ottawa Valley which ships as many as 30 cars a day received only 5 cars from the railway companies during a whole week recently.

Shingles are selling fairly well in Ontario, but the market is suffering considerably from the competition of Washington shingles. Recent shipments of Washington shingles into Ontario have been made at about ten cents below the price for B. C. shingles. Some of these shingles however, have been making trouble for their shippers as they have not been up to grade. In addition to making trouble for themselves by shipping such shingles the sellers are makink the market for B. C. shingles weaker and thereby causing a general trade disturbance.

The hardwood business in Ontario is not at all brisk. In the United States it is exceedingly dull. This is caused, it is generally thought, by the unsettled condition of the tariff matter. Whatever the cause, the hardwood trade in the States is completely of a hand to mouth character. Although the Ontario hardwood trade is not brisk, there is really nothing to complain of for this time of year. A fair volume of trade is in progress, but the new business is not very plentiful.

Some of the mills on the Ottawa are experiencing a shortage of logs. The dry period which occurred in the month of May is responsible for the tie-up which has taken place at some of the mills.

Eastern Canada

Heavy rains during the third week of June improved the driving conditions on the Miramichi waters in New Brunswick, and most of the drives not already abandoned will come out. The D. & J. Ritchie Company drive on the Little Southwest Miramichi was practically safe at the time. The Miramichi Lumber Company, Chatham, were having difficulties with their drives and decided to store the water, through the erection of a large dam on the Renous River. The work has been started.

The cut of the Lynch Company has arrived in safe waters. Altogether the situation shows much improvement, and lumbermen generally are optimistic.

The supplies available in Canada for the eastern United States lumber markets are not as plentiful this year as is usual. The very healthy condition of the English deal market is in a measure responsible for this. Prices for export to the United States are therefore holding firmly. There is a scarcity of 1-in., 1¼-in., 2 x 9 spruce, and the prices of these sizes are firm. No weakening of prices on Canadian lumber is expected during the rest of the year.

A fair amount of new business is reported for eastern spruce, at Boston, and prices have shown a tendency to improve, although they really have not gone higher. Frames are quoted at $23.50, and a few manufacturers are holding firmly at $24.00. Random is firm. A slight improvement has occurred during the past fortnight, in the demand for hardwood, at Boston. Maple is firm, and offerings are small. Birch is steady but a little quieter. Plain oak is stronger and inclined to be scarce. Stocks of quartered oak are plentiful and prices show an easier tendency. Boston orders for hemlock have been light of late. Holders, however, are not forcing their stocks on the market as dry stocks are not large. Eastern clipped boards are quoted at $19 to $19.50. There is a moderate demand only for shingles at Boston. It is difficult to make sales at $3.50. Clears are quite firm. Lath are quieter. The price for 1⅝- inch ranges from $3.65 to $3.75, and for 1½-inch from $3.40 to $3.45.

At New York there is only a restricted demand for eastern spruce, in cargo lots. Car lots however, are doing well, and prices are somewhat firmer. A continued firmness is expected during the summer. Lath are strong and have been experiencing a good business. Hardwoods continue firm at New York, particularly maple and birch. Offerings of quartered oak are plentiful. Low grade hardwoods are moving well. Hemlock prices are not changed and the market is rather dull.

Western Canada

The outlook for a good crop on the prairies improves with each succeeding week and with the improvement comes a corresponding strength in the lumber markets of western Canada. Some of the dealers east of the mountains are looking for a break in prices because of the dull trade in the United States. Vancouver manufacturers, however, declare that this will not be the case. Business on the Canadian coast of the Pacific is much better than on the United States coast.

The log situation in British Columbia shows very little change. Camps are reported to be operating almost to capacity and there are a lot of logs in the water up the coast. Fir logs are quite depressed, selling as low as $6 delivered. The price of fir is ranging from $7.50 to $9 for camp run. Cedar ranges from $7 to $10, according to quality. Mills continue to obtain enough business to keep their stocks about even. The strike in the building trade has had a depressing effect upon the market for lumber. It is believed that the strike, however, will not be of long duration.

Great Britain

In the recent sales at London 3rd Quebec spruce was in good demand. Larch of different sizes, also sold freely. Floorings were offered in small quantities, and the lots were keenly competed for. Sawn pitchpine has been in less demand and prices are slightly easier. Parcels of 3 x 9 yellow pine were cleared without difficulty at £13 3s. to £13 15s. per standard.

At Liverpool business has been done on a moderate scale and values are practically unchanged. Spruce continues to be in small supply and liner lots are taken up as they come to hand. Pine deals and boards meet with a steady demand and stocks are well in excess of the present consumption. Business in floorings has been quiet, but stocks of these boards are now small, the recent importation having been very light. Pitchpine of good quality, hewn and sawn, has been in fair demand, but wood of poor quality has been neglected.

At Manchester a brisk movement of timber has gone on at the dock yards, owing to the active state of the principal trades in the district. Spruce has moved freely, and floorings have been in more demand. Birch, in planks and deals, has again been in request and stocks are in very moderate compass. Planks are readily taken up, ex-quay, on arrival.

At the Tyne ports, consumption has been on a somewhat larger scale, the general trade of the district now being active. Saw mills are busily employed and sawn timber is in good demand, while stocks are not at all heavy.

At West Hartlepool sawmills are actively at work, and sawn timber is passing into consumption more freely. Redwood battens have been in good demand, and whitewood deals have been more called for by shipbuilders, who are now busy.

At Sunderland, also, shipbuilders are well employed, and a larger demand now exists for deals and redwood for shipbuilding and fitting purposes. A freer movement of timber from the quays is in progress and points to a larger consumption of lumber in the district.

At Glasgow spruce and sawn timber have passed steadily out from the yards. The event of chief interest to importers has been the coming to hand of the first consignments for the season, of timber from the Baltic. Oak has been in steady demand, chiefly for railway coach or wagon building purposes.

At Cardiff an improved inquiry for lumber has been experienced and orders are now coming in more freely. Oak and redwaad for railway uses have been in demand. Pitwood continues to arrive in large quantities and passes very freely into consumption among the extensive collieries of South Wales.

United States

Chicago:—City yards report a fairly heavy trade. Shipments to country retail yards are rather slow. No important improvement is expected in the country demand for a month or two. It is then expected that the farmers will require lumber and that trade will revive. Northern pine is quiet. Upper grade prices however, continue strong. There is a fair demand for the lower grades at steady prices. Hardwood has been slightly less active, but still is quite busy. Dry stocks are only moderate. The outlook for fall business is considered good. Plain oak continues in good demand. Stocks of dry oak are low. Quartered oak is quiet. There is a good demand for birch and maple flooring continues active. The demand for hemlock continues fair. No change is reported in the market for yellow pine. Offerings continue heavy. Prices are holding firm. Curtailment at the big mills is pretty general.

Buffalo:—The trade in northern pine is fair. The building trade continues quite active. Stocks are fairly well assorted, and low grades are inclined to be weak. There is a fair movement of hardwoods. Oak, birch, and maple are most in demand, and prices are unchanged, except in quartered oak which shows a tendency towards weakness. Elm is doing well. There is a moderate trade in hemlock, and supplies of lake lumber are increasing. The volume of business gives little cause for complaint as the building activity continues. Prices, however, still remain low. Only an average demand is noted for southern pine, and there is a tendency to reduce the top prices. Shingles are weaker than they have been for some time.

Market Correspondence

Car Shortage at Ottawa

Ottawa, June 26.—Serious scarcity of cars seems to be a great cause for complaint just now. While there is no special reason kiven for the scarcity, yet it exists, and it is almost impossible to get any cars at all.

The United States' market remains slow. There is a good demand from South America and the British market is steady.

The local demand continues exceptionally good. Building activity, both in the city and in the district, is great and all the planing mills are busy.

J. R. Booth is receiving great praise from the labor unions because of his recent action in reducing the hours of his men in the paper mill to eight hours a day. He did this without any request on the part of the employees. Important changes are being made in the Booth mills in the way of renewals and enlarging. The most important is the addition to the sawmill which provides for an additional gang of men. The machinery for this has arrived and the work of building will be begun at once.

The government has purchased Victoria Island at the Chaudiers and will move its shipyard to this point. The yard has been at the foot of the Rideau locks but it interferred with beautifying the city at this point and the government was asked to remove it.

The work on the section of the Canadian Northern Railway from Ottawa west began this week. It will be rushed with all possible speed.

The W. C. Edwards Company are actively continuing the work of rebuilding their mills at the Rideau falls. The frame buildings are being replaced with concrete structures and every now and then another permit for around $15,000 is taken out, which marks the ending of work on one building and the beginning of another.

North Shore Notes

Thessalon, Ont., June 20.—The lumbering industry has made great strides in this part of the country during the last ten years.

Commencing at the Soo, there are about twenty-five million feet of lumber cut there annually, whereas ten years ago the cut was comparatively small.

The Bruce Mines Mill now has a cut of about six million feet per year. Five years ago there was only a local mill at this point.

The mills at Thessalon will cut this season eighty million feet of lumber, whereas ten years ago Thessalon had a cut of only about six to eight million feet.

Blind River has doubled the capacity of its output in the past ten years. Cutler now cuts thirty-five million feet of lumber, where there was no cut for some years during the panic of 1896. The cut at Spragge is about twenty-five million feet, which has not changed much of late. The Spragge plant is one of the best on the shore, and has a supply of timber for many years to come.

The John Island mill, the Spanish River Lumber Company, and the Little Current mills are cutting about the same amount as formerly.

The Ontario government owns the finest belt of fine timber in the province. This is in the Mississaga Forest Reserve. When this timber is put into the market there will be some fancy prices bid as the timber is of fine quality and mostly white pine.

In my next letter I will have something to say regarding the hardwood in Algoma. This will be a great industry in the near future.—Algoma.

S. P. Musson, Son & Company, Barbados, report as follows under date of June 10:—White pine—Arrivals during the fortnight consist of the Schooner "Frances A. Rice" from Port Clyde, to selves, with 130 m. ft., and Trn. Schr. "Edyth" from Sheet Harbour, with 207 m. ft. Both of these cargoes had been sold to arrive at $32 for merchantable, and $24 for second quality, but lower prices would have to be accepted for any further arrivals. Spruce—No receipts, but a couple of cargoes have been sold to arrive. Pitch pine—No arrivals, but there is a cargo on the way which is long overdue. Shingles—No receipts of either Gaspe or ceday laying, and both are in good demand, especially the latter.

Canadian Wood in the United Kingdom

Liverpool, June 20.—The amount of timber used for structures required by the coronation of King George V. was greater than most people in the trade had counted on. Not a few people were puzzled as to where the timber was obtained. The city authorities saw to it, from first to last, that only good and useful wood was used. They laid down the law that all timber used on any wooden structure must be of "sound, square scantlings;" that guard rails should be fixed on sloping wooden structures at every five rows, where the slope of the wooden structure exceeded twenty inches; that wooden structures abutting on the public way should be close boarded in front, to a height of at least five feet, and that all stairs should be boarded on the under side.

The regular timber trade of London was interferred with by the extraordinary demands of the coronation time. The building trade and the general joinery trade slowed down, owing to the demand for joiners for coronation stand and structure work. Money will be made by buying and selling much of the timber which was used for coronation structures. Bargains in this timber will be plentiful and will be taken up readily. It is expected that trade generally will be more active, as building and joinery work will go on, normally again, and there is likely to be a spurt after the slowing down for the great jubilation.

Railway Carriage Building

The manager of the carriage and wagon works of the North Eastern Railway Company, speaking recently of the equipment and output at his company's works, stated that the whole of the timbers for the sides and ends of the bodies of coaches built at the works were machined to standard templets, and in the processes, from log to finished work, were sometimes handled by no fewer than twelve woodworking machines. In the construction of a North Eastern 52 feet bogie carriage, about 83,000 separate pieces of ironwork, timber bolts and other parts were used. Most of these were handled many times during the erection of the vehicle. The principal woods used in building the carriages were English and American oak, Dantzig oak, and Polish oak, teak, ash, mahogany, satinwood, elm, sycamore and Kauri pine; and, as soft woods, pitchpine, redwood and spruce. It will be seen accordingly, that the English railway carriage building industry now makes a very large claim on the wood resources of the world.

The Timber Trade at Liverpool; More Accommodation

The Mersey Docks and Harbor Board have decided to carry out improvements at the Brocklebank Branch Dock, one of the north group of docks at Liverpool, which will afford more accommodation and convenience for timber importers. A double-storey shed, about 500 feet long and 95 feet wide, is to be erected over a low-level quay, which has in the past been used as a discharging "bank" for vessels bringing timber. These vessels usually set low-on to the quay, to discharge their cargoes through low-ports. This plan of working has almost fallen into disuse, only four vessels having discharged at the quay, bow-on last year. The quay will be raised and the shed will be built over it, and will be provided with four roof cranes. On land adjoining, to the south of the shed, a roadway 52 feet wide is to be made, railway lines connecting with main lines are to be laid and an area is to be set apart and specially paved as a spacious store area for timber, changes which will be much appreciated by timber importers.

Furniture and Furniture Woods

The value of the furniture trade of the United Kingdom is shown with fair accuracy by a section of the Census of Production, which was lately issued.

The full total value of articles of furniture, including beddings, cushions and trimmings, is given as £17,251,000. Of late years, the making of cheap furniture and of what may be termed cheap, medium class furniture, has greatly increased in the United Kingdom. While some of the larger and older factories have been extended, and up-to-date machinery for turning out goods quickly, has been introduced as far as possible, a multitude of small factories have come into existence in London, Liverpool and other towns, and are producing furniture freely. The wonder is that these small factories have been able to keep going, yet they have done so, and, together, have turned out a large quantity of furniture. The woods used chiefly by these manufacturers, large and small, are yellow pine and spruce for body or "core" work, birch,mahogany of the cheaper sorts, and walnut, also of the cheaper sorts. Highly figured mahogany

OWING to the great scarcity and almost prohibitive prices that are prevailing now for nearly all lines of dried Fruit such as Apples, Peaches, Prunes. We look for an exceptional demand for Natural Figs.

220 West King Street
TORONTO, ONTARIO

and walnut is little used, in the solid, as it is termed, as the logs are purchased at high prices for cutting into veneer. A very large proportion of the furniture now made has its main show surfaces of veneered wood, highly "curled" or "barred" wood being commonly veneered on a plainer wood of the same class. Sound mahogany with a fair degree of color, but otherwise quite plain, is obtainable at the present time at London and Liverpool, at 2¾d., 2½d., and 2d. per foot, 1 inch thick. The cheapest American walnut is obtainable at about 2s. 3d. per cubic foot, which works out at 2¼d. per foot of the inch board, though if cut into inch boards this timber would certainly be more than 2¼d. per foot. The cheapest American walnut is accordingly a little more costly than the cheapest mahogany, while nearly as attractive, American, Italian and Circassian walnut brings as much money as some of the more attractive mahogany of Cuba and St. Domingo.

Quebec and St. John's birch at nominally 1s. 6d. to 2s. per cubic foot, is still cheaper than anything but the very cheapest mahogany, so will appeal to furniture makers for use wherever birch can be used for medium and cheap furniture. As supplies and prices stand at the present time the cheaper goods in walnut, mahogany, birch, cedar and oak, are equally at the service of the furniture maker. As regards price alone, little advantage is offered by one when compared with another. For some uses, birch is preferrable to mahogany or oak, and can be stained cheaply to resemble mahogany, rosewood or ebony and takes a stain well. The cheaper hard woods have come into large use among makers of furniture of the cheaper and medium kinds.

Gordon Grant & Co., Port-of-Spain, Trinidad, report as follows under date of June 12:—No further arrivals have taken place, and, although dealers' yards are now fairly well stocked, an outlet can always be found for a suitably assorted cargo of good quality. White pine boards are in constant demand, and we recommend consignments.

Status of Modern Hardwood Flooring

A high authority, yet perhaps somewhat prejudiced by business interest, regards maple as standing at the head of all hardwoods for flooring.

The next wood in point of merit, he says, is beech, followed by birch. Maple is the best of the three, because of its hardness, compact grain and susceptibility to dressing and sandpapering to smoothness of surface, and its resistance to wear without slivering.

The life of maple flooring, under ordinary wear, is claimed to be from twenty-five to thirty years, while there are those who claim that beech will last but little more than half the number of years named, and birch not so long as beech.

The manufacture of maple flooring has been carried on for the last twenty or more years with all the skill and developing ingenuity and approach to perfection characteristic of an industry that has been energized with strenuous competition. Production has been pushed with so much vigor that output has always been prone to overleap consumption, and hence there has been strife between the manufacturers to turn out the very best flooring possible.

The first requisite in the manufacture of maple flooring is the quality of the lumber. Sugar, or hard maple, is, of course, to be recommended as the best that can be had under the name of maple. But not all lumber turned out of maple loge is fit for good flooring.

One of the pronounced essentials in the manufacture of maple flooring is to see that the lumber is properly and thoroughly seasoned before it is run into finished form through the machines. This is accomplished by air and kiln drying. The stock, which is mostly in the shape of inch boards, should be sufficiently air dried before it is put into the kiln. In order to get best results the heat should be applied gradually, as a too sudden precipitation of heat invariably warps the lumber.

Lumber Firm Under New Management

Mr. Walter W. Baer, who for the past two years has been assistant to Mr. H. H. Spicer, of the Export Lumber & Shingle Company, Limited, Vancouver, B.C., recently decided to branch out into business on his own account and is now at the head of the Mainland Lumber & Shingle Company, with offices at 612 Dominion Trust Building. Mr. Baer is aggressive, energetic and popular, and having had an excellent training in all branches of the lumber industry, his experience and good business habits will stand him in good stead in winning and holding customers. Previous to engaging with the Export Lumber & Shingle Company, Mr. Baer was in the employ of the Western Lumber & Shingle Company, and other well-known Vancouver firms, and in this way formed a wide acquaintance with the trade in British Columbia and the prairie provinces. He will have full control of the entire cut of several lumber and shingle plants, and will be in a position to supply all demands for any quantity or quality of stock.

Algonquin Steel Shanty Range

For Coal or Wood, or Both

Built for the big capacity and rough usage required in

Lumber and Mining Camps,

Railroad Construction or Boarding Houses,

Threshing Outfits and Ranches

Big cooking surface.
Big Oven—Big Reservoir—Big Fire Box—Big Ash Pit.
Heavy Steel Body—Extreme Heavy Cast Iron Top and Lids.
Duplex Grates and Fire Box Linings—all of heaviest design and construction.
Double Steel Wall on top and bottom of oven, interlined with heavy Asbestos Board, ensuring quick and even baking.
Top Cooking Surface, 53 x 28 in.
Six 10 in. Cooking Holes.
Oven 24 x 26 x 14. Fire-door 9 x 9. Ash Door 9 x 9.
15 Gal. Capacity Reservoir.
Note what the Shelf made by the Big-One Piece-Drop-Oven Door means to the cook when baking.
Oven Thermometer supplied at small extra cost if desired.

It is absurdly easy

to make a lot of fine resounding assertions about the "AMPHIBIA" Water Proof Belt. Any man with an extensive vocabulary could do that about any weak-knee'd proposition.

But we're out to convince you, so here's a definite offer.

We will send to any responsible firm

ONE "AMPHIBIA" BELT

on trial and if it fails to do as we state, it can be returned and no charge will be made.

Now, advertisers sometimes make offers which have a nice open-handed appearance, but which it would'nt pay them to get accepted.

But our offer, as outlined above, has been accepted and

Not one belt has come back

One customer says that it lasts five times as long as any other belt he has ever used.

Enough to make you think, eh?

Remember, "AMPHIBIA" is waterproof and made from first-class oak leather.

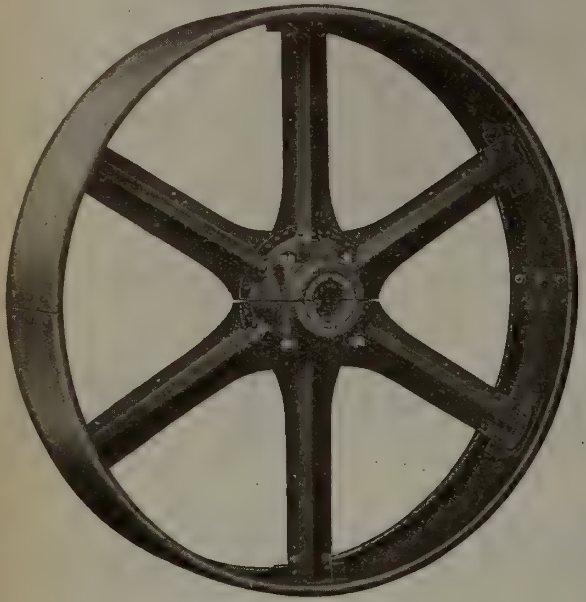
ONEIDA,

The Steel Pulley of better belt contact, lightness, maximum strength.

Oneida Steel Pulleys differ from any similar produce made. And in this difference lies their strength,



In construction the Oneida Steel Pulley is ideal. It is strongly reinforced, is lighter than any other steel pulley by ⅓ to ½ and possesses greater strength. The perfectly oval crown face insures a 20% better belt adhesion.

They are built in the greatest range of sizes of any steel pulley in the world, from 6 in. to 126 in. with 2 in. to 40 in. face with ⅞ in. to 8½ in. bore.

EDGINGS

Ontario

During the past winter the Hawkesbury Lumber Company, Hawkesbury, Ont., cut 500,000 pieces of logs.

J. S. McKenzie's saw mill, at Morrisburg, Ont., was destroyed by fire recently. The loss amounted to about $5,000 and it is reported that there was no insurance.

The Rideau Lumber Company, Ottawa, expects to dispost of 30,000,000 feet of various kinds of lumber this season, comprising railway ties, lath, shingles and building materials.

The W. C. Edwards Company's cut this season is 85,000,000 feet. A large quantity of this lumber will be manufactured by the company at its various woodworking factories in Ottawa.

Mitchell Brothers, of Lucknow, Ont., have nearly completed arrangements for establishing a hardwood mill on Cockburn Island, Ont. Mitchell Brothers already have several other mills in the province.

A report is current that the immense lumbering business of J. R. Booth, valued at $11,000,000, will be brought by British capitalists. Another rumor says the Eddy works at Hull will be taken over by an English syndicate.

J. J. Hill has taken over the eitire business of Davis & Hill, Ottawa, and will conduct it on his own account. This business was established eight years ago. The planing mills and lumber yard are within the city lmiits.

The Ontario Government is advertising for tenders, to be received up to October 1, for the privilege to cut the red, white and jack pine timber over eight inches in diameter on the Metagami Indian reserve in Northern Ontario.

The Bronson Lumber Company, Ottawa, has transferred most of its lumber manufacturing business to the Pacific coast. The interests at Ottawa now consist mainly in the development of its water power and carbide works.

The auction sale of the Imperial Pulp and Paper Mills of Sturgeon Falls Ont., was to have taken place at Osgoode Hall, Toronto, on June 13th, in connection with the liquidation of the company's assets by E. R. C. Clarkson. Mr. J. H. Moss, on behalf of the bond holders, appeared and moved to have the sale postponed, as several persons wishing to purchase were unable to attend. The order was made and the sale will not take place till July 13th.

Eastern Canada

Robin Noe, sawmill owner, Minerve, P. Q., has made an assignment.

Under the name of the "Hartland Woodworking Company," application has been made for incorporation of J. T. Carr, D. H. Nixon, A. G. Baker, and others of Brighton, Carleton county, N. B. The capital stock is to be $15,000.

D. G. Gilmour's mill at Kazaburna, P. Q., is expected to turn out 10,000,000 feet of lumber this year. Mr. Gilmour cut a large number of railway ties last winter, mostly cedar and tamarac, which, owing to rapid railway construction, are meeting with a ready market.

James Beveridge, president of the New Brunswick Pulp and Paper Company, Millerton, N. B., returned from England recently. Mr. Millerton has arranged to install another paper machine at the Millerton works which will double their output and give employment to about thirty more hands.

The Hartland Woodworking factory, Hartland, N. B., which has been idle for about eight years, has been bought by a company comprised of local business men. It is being thoroughly overhauled; new machinery and an 80-horse power engine and boiler are being put in. It will be ready for operation soon.

Mr. J. Hamilton Benn, M.P., London, Eng., is one of the promoters of B. Grier, Limited, Montreal, recently incorporated to carry on a lumbering and a paper and pulp manufacturing business. Mr. Benn is a member of the well known timber trading firm of Price and Price, Limited, London, which has recently opened offices in New York.

The Grand Metis Power Company, Limited, with a capital of $100,000 has been incorporated under Dominion Charter by W. J. Shaughnessy & Co., of Montreal, for the purpose of carrying on a light, heat and power Co. The powers granted to the company also include the right to manufacture, buy, sell, and deal in timber, lumber and woodenware, pulp and paper, and other products thereof.

The box factory operated by Moirs Limited, near Bedford, N. S., was recently destroyed by fire. The loss to the building, machinery, and stock was about $18,000, and the insurance about $12,000. The boxes manufactured by the company were used for shipping their extensive product in biscuits and confectionery. Plans are already being arranged for the erection of a new factory which will embrace a number of important improvements.

The Edward Partington Pulp & Paper Company of St. John, N. B., by the purchase of two additional lots, have practically secured the whole of what is called Unino Point, where their pulp mill is loiated. The additional property will be utilized in connection with the paper mill which they will build. The plans for this mill have not yet arrived from England, but are expected soon, and construction work will be started as soon as possible thereafter.

Among the industries to be developed in Canada this year will be the manufacture of "Kraft" wrapping paper, at present imported from Sweden. It will shortly be made in Quebec by the Wayagamack Pulp and Paper Company, which recently acquired the half century old lumber business of Alexander Baptist. at Three Rivers, where a 200 ton pulp and paper mill is being built. They have an area of about 1100 square miles of timber and pulpwood.

Western Canada

The Northbrook Shingle Company, Abbotsford, B. C., have dissolved.

Patrick Kennedy and John T. Mangan, lumber merchants, Fernie, B. C., have dissolved their partnership.

The Mackay Woodworking Company, Limited, Victoria, B. C., has been incorporated with capital of $60.000.

The Fort George Trading and Lumber Company, Limited, Vancouver, B. C., has been incorporated with capital of $200,000.

A. G. Lambert Company, Limited, Nelson, B. C., has been incorporated to carry on a sawmilling and lumber business, etc. The capital is $150,000.

British Columbia mills tendered for the 8,000,000 feet order of the Grand Trunk Pacific, which was awarded to the Port Blakely Mill Company, but had no chance, the bids from south of the line being lower.

The Bowman Lumber Company's mill at Revelstoke, B. C., was completely destroyed recently, together with several hundred thousand feet of unsawn timber. The loss will be $70,000, covered by insurance.

Cranbrook, B. C., people have organized the Yahk Lumber Company, Ald. S. Taylor being president and W. G. Morton, secretary. Others interested are V. H. Baker, J. R. McKnabb, James Taylor and Alex. Taylor.

The Alberta and Great Western Railway have filed claims for damages amounting to $3,500,000, with the executive council of Alberta. The Empire Supply Company, have entered a claim for $121,796, for ties, timber loss, and loss of profits.

The Port Moody, Port Moody, B. C., Shingle Mill, belonging to Maclean and others, was destroyed by fire recently. The main mill was a total loss but the drykiln was saved. The loss is estimated at $20,000. It is partially covered by insurance.

Three-roomed cottages, comfortably and hygenically furnished, have been erected by the Edgewood Lumber Company, of Castlegar, Kootenay district, to take the place of the old-fashioned boarding house. Two men will live in each cottage, and meals will be taken in a large hall built for the purpose.

The George C. Salt Lumber Company, Limited, of Vancouver, B. C., announce the formation of their company. George C. Salt, who for the past twenty-five years has been identified with the lumber industry of the Pacific Coast, is president and general manager. John W. Black, for many years connected with the banking business, is secretary-treasurer.

Construction of a new sawmill to replace the one at Pitt River, Coquitlam, destroyed by fire several months ago will be started within a fortnight by the Pitt River Lumber Company. Mr. J. C. Shields, president of the company, states that the mill will be built of concrete and steel in order to make it absolutely fireproof. The plant will cost between $125,000 and $150,000.

Eight hundred square miles of limits in the vicinity of Revelstoke have been acquired by the Minnesota capitalists represented by Charles E. Stone, of Minneapolis, and F. C. Adams, of Duluth, with Charles A. Barnum as consulting engineer. The intention is to erect saw and pulp mills and utilize all the timber growth. Several miles of railway will be built in connection with the scheme, which is well under way.

Theo. Thoreson, president, and Charles Thoreson, secretary-treasurer, of the International Lumber and Elevator Company, Limited, have opened a large new lumber yard at Moose Jaw, Sask., and have made Moose Jaw the head quarters of the company. The company operate a number of lumber yards and elevators in the west and intend also to put in branches on the new branch railway lines out of Moose Jaw and Swift Current.

The Ocean Falls Company, Limited, of Ocean Falls, B. C., have sent up the second instalment of sawmill machinery from Vancouver to their mills. The machinery included twin corliss engines; two band mills; two edgers; one gang; two compressed air automatic trimmers, two slab slicers and two roll feed bands. The mill will have a capacity of 350,000 feet in a 10-hour day. The shipment also included machinery for the new pulp mill which the company are erecting.

Messrs. Hatch Brothers, who have been connected with the sash and door business for a number of years in Toronto and for the last eleven years in Vancouver, have just moved into their large new premises at the corner of Cedar street and Fifth avenue, Vancouver. The factory has been equipped with the latest improved machinery, and when completed will represent an investment of about $35,000. All kinds of interior finish will be manufactured, and the factory expects to be able to turn out 400 to 500 doors a day within the next few weeks. A separate set of machines has been installed for the manufacture of windows, which is capable of making from 700 to 800 complete windows per day.

The McLelan Lumber Company of Vancouver have concluded a deal for the purchase of the timber limits and logging camps of the Ben Roberts & Co. of New Westminster. It is also reported that they have secured a sixty-day option on the Jervis Inlet Lumber Company's millsite at Ladner. It is the intention of the McLelan Lumber Company to increase their capitalization and to erect a modern lumber and shingle mill and sash and door factory in place of the mill recently destroyed by fire. The timber holdings of this company together with those of Ben Roberts & Co. will aggregate 75,000,000 feet of standing timber, which is comparatively easy of access. Mr. A. W. McLelan has gone east for the purpose of placing the majority of the stock for the new mill.

Trade Enquiries

568. **Lumber.**—An Auckland. New Zealand, manufacturers' agent with good business connections would like to represent a Canadian lumber company. References given.

539. **Timber properties.**—A London firm of estate agents is derirous of getting into touch with reputable firms in Canada through whom they could purchase timber properties.

591. **Sycamore blocks.**—A Lancashire firm is in the market for sycamore blocks from 6 in. diameter to 48 in. in lengths from 2 ft. 6 in. to 12 ft., roughly trimmed with the adze.

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

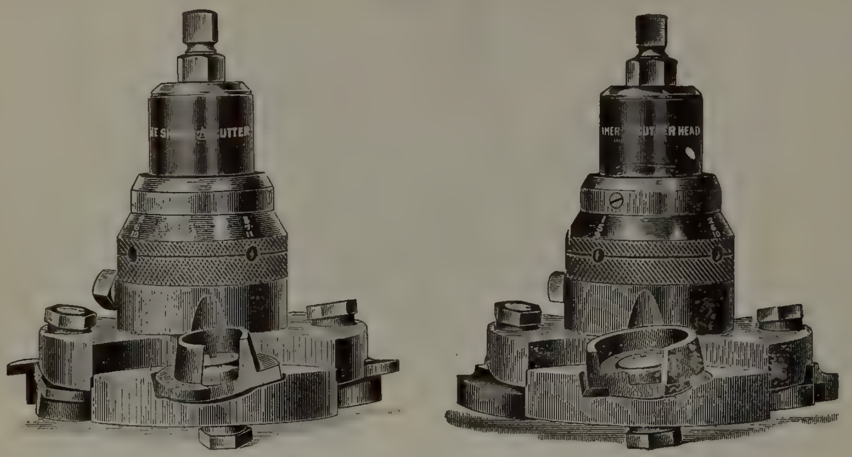
Shimer Cutter Heads and Cutters



Our "Best of All" Figs. 202 and 203 with 4 Bits to each Head.

For Matching Hard, Cross-Grained and Knotty Lumber

THE SHIMER CUTTER HEAD

is the Only Tool You Can Rely Upon

It has Strength, Durability and Correct Working Principles. It feeds faster, works smoother, cuts true to pattern. No fitting, no trying—no filing to shape. You sharpen the Cutters with a file and set them with a guage—plain as day.

Everybody profits by their use. For Flooring, Ceiling, Siding. For Ship Lap, Jointing, Double Ceiling. For Doors, Sash and Special Designs. Coping Heads to match.

Your Capacity Increased—Your Labor and Expense Reduced.

Rossette Cutter Head

Our new Head and other tools for the purpose of making Rosettes should interest you if you do any work in this line. The Head is made with interchangeable milled Bits and turns any substantial wood turning lathe into a Rosette Making Machine with large capacity. Corner and Plynth Blocks with turned Rosettes are always in good style for interior house finish and are quickly and neatly made with this new Head.

Price, Head complete, $9.45.

Filing Stand and Tracker

This is a neat little device to fasten to a work bench for holding a Head when filing the Bits. It holds the Head with a stub spindle and is better than the ordinary pinch vice which, in time, mars the surface of a Head. The Tracker Attachment sets the Bits to share alike in the cutting.

Price, plain Filing Stand $4.87
Price, Filing Stand with Tracker, $11.37
Price, Extra Stub $1.00

In ordering give the number stamped on your Shimer Cutter Head.

We make two styles of Grinding Machines to lighten and hasten the work of the filing room. Particulars sent upon request.

Cutterhead for Matching Reversible Glue Joints

turns out a most satisfactory fitting of the tongue and groove, interlocking from the same piece of matched material, requiring but one Head with Bits to produce. The jointed material will fit together when the pieces are sawed to length by simply turning the one piece end to end.

Glue Joints must depend upon accuracy as well as permanency of pattern. We guarantee both.

Prices range from $15.54 to $17.30 for a four bit Head, and from $19.96 to $22.60 for a Head with 6 Bits complete.

Bolts, Wrenches, Etc.

We carry a full stock of supplies and can fill orders promptly for anything in our line, such as Wrenches, Planer Head Bolts, Nuts, Washers, Gauges, Set Screws, Brass Washers for under Bits, etc.

A Smooth Surface

on lumber as it comes from the machine will save much of the extra labor on the Sander. For several years we have been making a Shear Cutting Cylinder which is now used almost exclusively by some of the large hard wood flooring manufacturers. It has long since passed the experimental stage and will prove all our claims for it. Send for full information.

OUR "BEST OF ALL"

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set $40.95
Price with 6 bits to each head, the set 49.27
Price with 8 bits to each head, the set 57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—⅜ at $1.30 each and Bits for 2-in. thick plank at $1.63 each.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1¼-in. $31.20
Price, with 4 bits to each head, the set, 2-in. 33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and to interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1½-in. thick $34.84
Price, with 4 bits to each head, the set, 2½-in. thick 35.88

Double Ceiling Heads

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling Heads complete with Bits, net, $40.94

The Shimer Cutter Head for O.G. Batten and Siding

These heads are especially designed to work O. G. Batten or O. G. Siding, having three circular cutters in line of the cut, seated and firmly bolted to one side of the head flange.

We make them to suit any matcher or moulder. They turn out O. G. Battens as regularly as our matcher heads work tongue and groove flooring. Give measurements same as for flooring heads; or, if flooring heads are already in use on your machine, give their record numbers, and send a cross section of the batten—wood sample or drawing.

Price for each Cutter Head, without bits.. .. .. $9.75
O. G. Batten Bits to mould ¾-in. deep or less, net each 2.08

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One-way Cutters

The dealer who accepts your order for the Shimer Cutter Head and supplies you with another means to deceive you in no small matter. Look for the Name and Trade Mark "The Shimer Cutter Head" stamped on every genuine tool. Any other is spurious—send it back—demand the genuine, of quality and helpfulness, with a record of 40 years of upbuilding and improvement. It costs no more.

ARE YOU SUFFICIENTLY INSURED?

SPECIAL RATES TO LUMBERMEN

Here's a Stone Roofing

Plant of Robinson Clay Products Co., Akrons O. cov'd with J-M Asbestos Roofing over 20 yrs.

Think how long it will last !

J-M Asbestos Ready Roofing is literally a sheet of pliable stone—with the lasting qualities of stone.

Also with the fire-proof, rust-proof, rot-proof and acid-proof qualities of Asbestos. And—like all stone—it *never* needs painting.

It consists of several layers of Asbestos Felt securely cemented together with alternate layers of pure Trinidad Lake Asphalt—both practically *indestructible minerals.* No stronger combination of element-resisting minerals is possible. There is not a particle of perishable material in

J-M ASBESTOS ROOFING

We can tell you of many buildings—give you the names of the owners--on which this Roofing, without any painting or other protection, has withstood the wear and tear for nearly a quarter of a century and is in good condition to-day.

If you wish to protect your buildings, at the lowest cost per year, from fire and all weathers, from heat in summer and cold in winter, get J-M Asbestos Roofing from your dealer. Sold direct where we have no dealer.

Write our nearest branch for a sample of this curious rock from which J-M Asbestos Roofing is made, also sample of J-M Roofing and Catalog No. 303.

LOGGING AND INDUSTRIAL LOCOMOTIVES

The knowledge and experience gained in building locomotives of all types, capacities and sizes for every kind of hauling is applied to every locomotive we build, and is available to you.

Our small locomotives for logging, and light switching service are not merely selected from designs previously built, but are special designs to meet special requirements.

They are designed and built with the same care required for 200 ton locomotives. Only the best materials are used in their construction, and every part is made to jigs or templates, guaranteeing that repair parts will fit.

They are constructed with a view to the fact that they must sometimes be operated a considerable distance from shop facilities, therefore simplicity and sturdy construction are vitally necessary.

Fuel cost is always important. This is considered in the design and capacity of the boiler, and in the design throughout.

Write us concerning your requirements or ask for a consultation with our engineers.

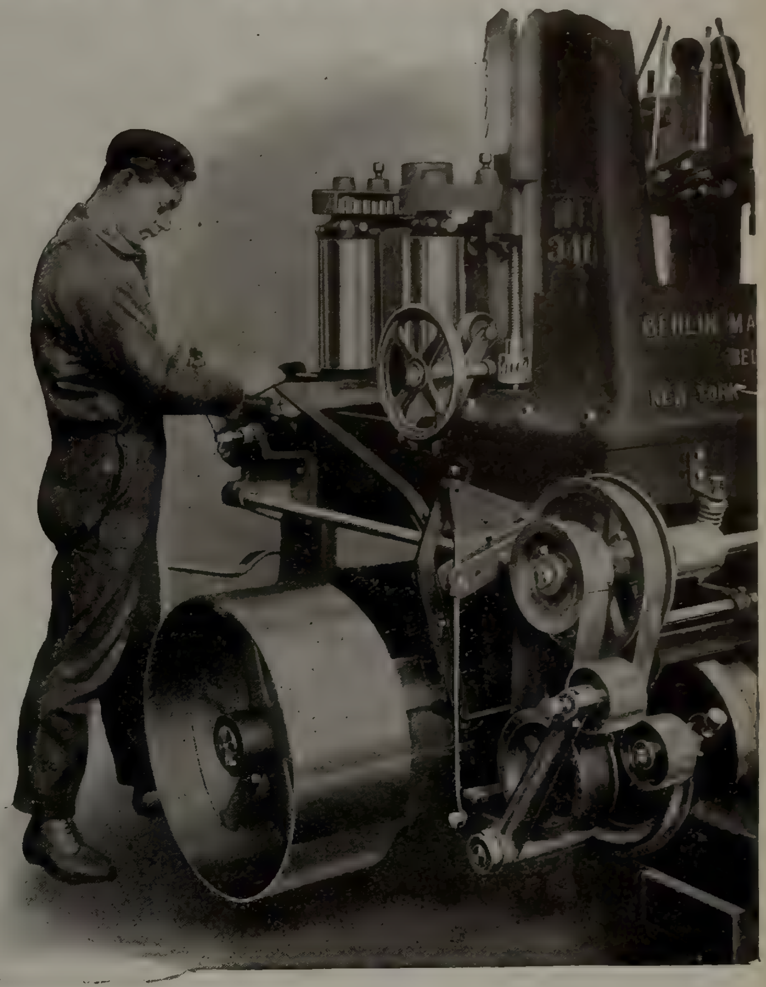
We are in position to meet every requirement in locomotives and to supply repair parts at short notice from our Works at Longue Pointe, Montreal, Canada.

MONTREAL LOCOMOTIVE WORKS, LIMITED

BANK OF OTTAWA BUILDING, MONTREAL, CANADA

Most Efficient Feed Roll Drive

Frictions have no place on a band saw. Our sturdy belt variable feed device is simple and durable, transmitting every ounce of power to the feed rolls. The operator has instant change of feed on his machine but this is simply one of the distinctive features found on



BERLIN BAND RE-SAWS

Send for illustrated catalog of the line

The efficiency of the Berlin Variable speed device, together with the construction of the feed roll works would alone make the Berlin Band Saw line the most successful built.

The upright knees to support the rolls is cast in one piece with the part that slides on the rail holding the feed works.

The outside knee is heavily battened or braced, and the slide has a bearing on the rail twice as long as the feed roll is high. This construction prevents any tendency of the slide to bind in setting the rolls, and makes it easy for the operator. Also, it holds stock in a true cutting plane with the saw

The inside roll housing is also cast in one piece with the slide; but the slide in this case is cast in the middle of the upright, so that pressure is exerted in a straight line, with no possibility of any point binding, or the roll getting out of line.

Thus Berlin feed works rigidly withstand any strain or pressure without yoking the two roll housings together at the top, and limiting the width of stock that may be sawed, to the height of the rolls.

This rigidity of the rolls while working, and the abundant power given them through our variable speed device, provide for the greatest capacity possible, as well as the most accurate resawing.

The continuous day after day performance of the Berlin resaws in mills and factories the world over prove every statement we have made.

You can prove them in your own mill under your own conditions. Your operator will tell you what other operators have told us—that because of the improvements offered on Berlin Resaws they are the easiest handled, the most carefully built, the most efficient Resaws in the market.

When you have looked into the Berlin Band Saw line so as to know it, you'll understand why nearly eleven hundred are in use to-day and the number growing fast.

Your operator will like any Berlin Band you buy.

Ask for illustrated Catalog.

What We Think of Berlin Band Saws:

Namu, B.C., Oct. 11,

Mr. V. C. Young, Esq.,
Care Berlin Machine Works, Limited,
Vancouver, B.C.

Dear Sir:—

In reply to your favor of October 8th, we beg to state that the No. 344 Berlin Band Resaw received from you some time ago, is giving us perfect satisfaction. Yours truly,

Robert Draney.

Hamilton, Canada, Nov. 25th.

The Berlin Machine Company, City.

Dear Sirs:—

We feel that you must appreciate your Band Resaw No. 289, yet we know it will be a pleasure to you to receive a line from a customer, expressing to you their satisfaction. So we are dropping you these lines to say we are entirely satisfied with the resaw you sold to us and that it is all you claimed it to be and works perfectly. We are, yours truly,

The M. Brennen & Sons Mfg. Co.

Penetanguishene, Ont., April 2nd.

The Berlin Machine Works, Hamilton, Ont.

Dear Sirs:—

Your favor of the 29th to hand. In reply beg to say we have had excellent satisfaction from the Band Resaw, No. 341, which we installed. It has run steadily since it was put in and has done all that you claimed it would do. It is the best we have seen yet.

Yours truly,
The C. Beck Manufacturing Co., Ltd.

USE

Your Mill's Refuse

To Dry and Preserve Your Wood

"The HOWARD" Vulcanizing Process

Positively the quickest and most economical system known for drying and Preserving Lumber, Railroad Ties, etc.

POINTS IN ITS FAVOR:

Improves quality of all lumber
Increases the crushing strength
Increases the transverse strength
Reduces the weight 30 per cent to 45 per cent
It materially prolongs the life of wood
Eliminates shrinking, swelling and warping
Emphasizes and beautifies natural grain of the wood
Makes fit for commercial use woods not otherwise merchantable
Does away with necessity of maintaining heavy stock of lumber in yards
By this process green lumber taken from the log can be used for building purposes in 2 or 3 days

---

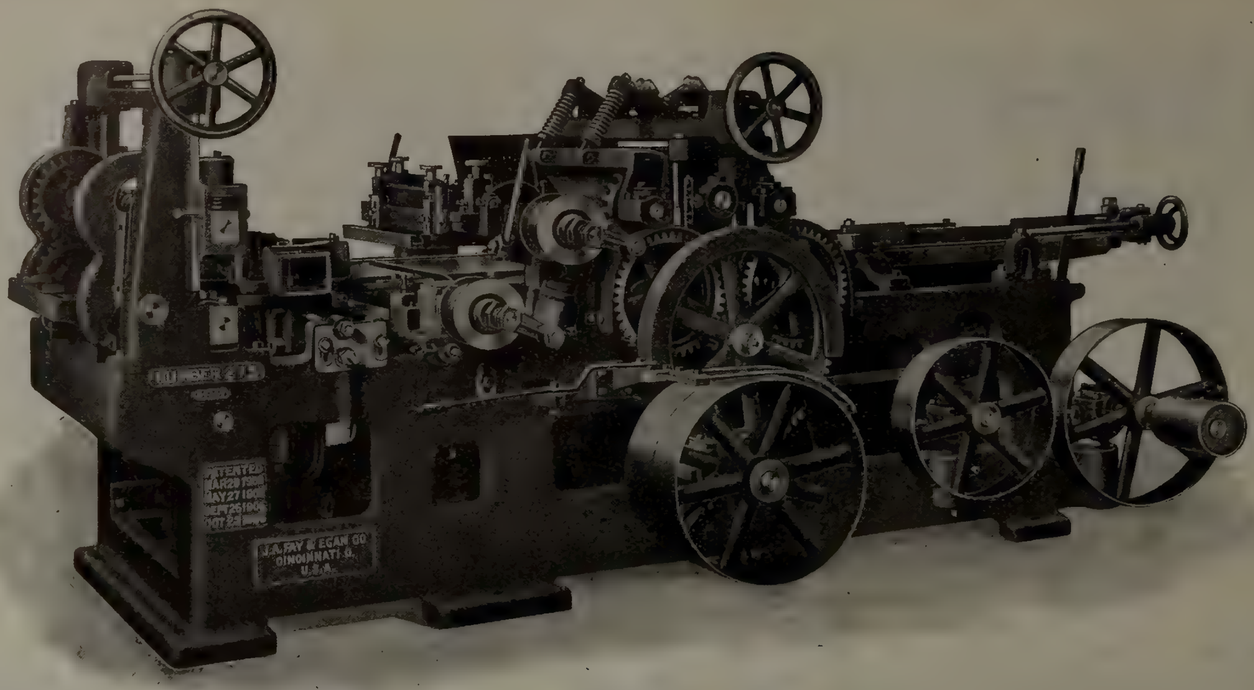
We invite Lumbermen and Owners of Woodworking establishments to see a practical demonstration of the process at our plant in Toronto

Our descriptive booklet tells in a most interesting manner the advantages, etc., of "The Howard System." It's yours for the asking

Lumber Vulcanizing Corporation

of Canada, Limited

Executive Offices: McKinnon Building - TORONTO



No. 275 Planer and Matcher, Four or Six Rolls.

Read Their Opinion

One of the largest, and most conservative manufacturing companies in the country has just written us the following:—

> **"We are pleased to write you in regard to the No. 275 Planer and Matcher we purchased of you some time ago. We use this machine on a great variety of work, ranging from ¼ x 1½" soft wood to 3⅝ x 10½" oak and also 4¼ x 6⅝" hickory. We plane all this material on four sides, sometimes taking a ½" cut with the side heads on oak 3⅝" thick. A large percentage of the work done on this machine is planing and matching semi-circular tank staves, 1¼" x 4" wide. We find we can feed all the various kinds of material as fast as a man can keep the machine full and machine appears to have a capacity greater than this on nearly all kinds of stock including the tank staves. We are entirely satisfied with this machine."**

This is conclusive testimony of the ability of our No. 275 to take care of all kinds of planing and matching. But its use does not end here—run back the side heads and you have a fast feed double surfacer; change the bits and adjustments—you have a floorer; substitute molding cutters, and you have an up-to-date Inside Molder. For general purpose mill and manufacturing work no other Planer can even equal the Fay & Egan No. 275. It is what modern engineers call a "high efficiency" machine.

Let us send you a facsimile copy of the original letter quoted above, together with large illustration and full details of the construction of this great general purpose planer. Your post card will have prompt attention.

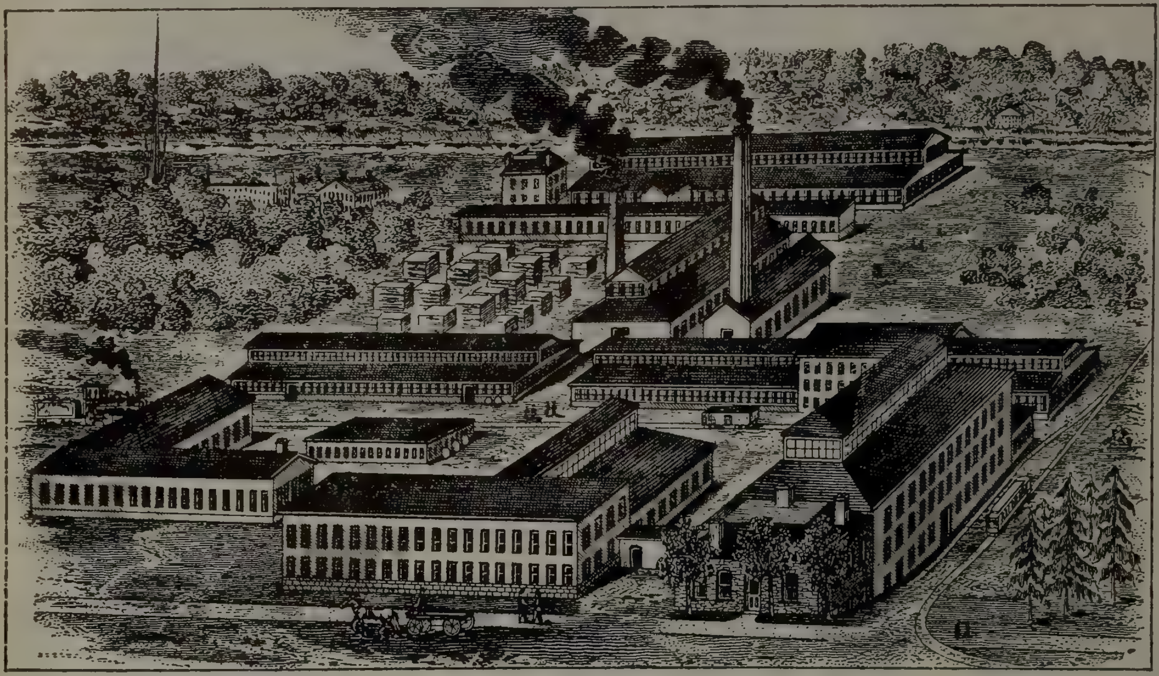
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

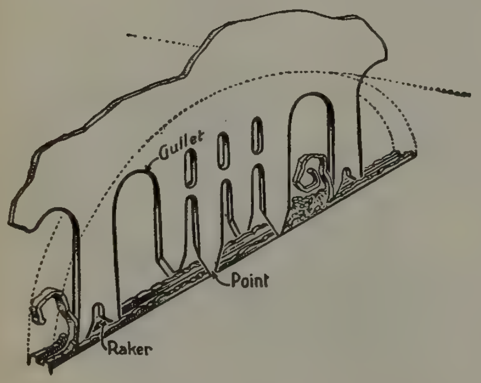


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

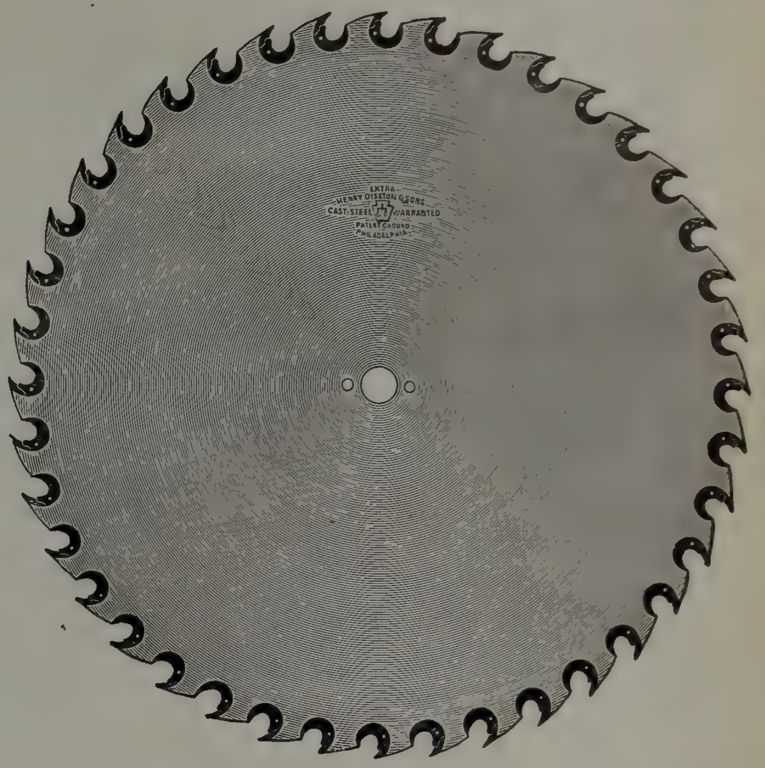
Disston

Saws Tools Files



The tool that is "cheapest in the end" is usually the one that is a little more expensive "in the beginning."

The initial cost of Disston Saws, Tools and Files may be slightly higher than that of the ordinary kind, but Disston lasts longer and is more easily kept in condition, permits faster, more efficient work, and after all, is more economical.

Disston Crucible Steel is exceptionally adapted to making high grade Saws, Tools and Files. Its uniformity and durability, in conjunction with expert shop treatments, have made Disston Tools the best on the market.

Many of the most widely favored types of saws, tools and files have been designed and invented in the Disston works. Disston improvements and innovations have always set the pace, have always led the industry.

"Weldless Steel Chain"

The Strongest Chain in the world

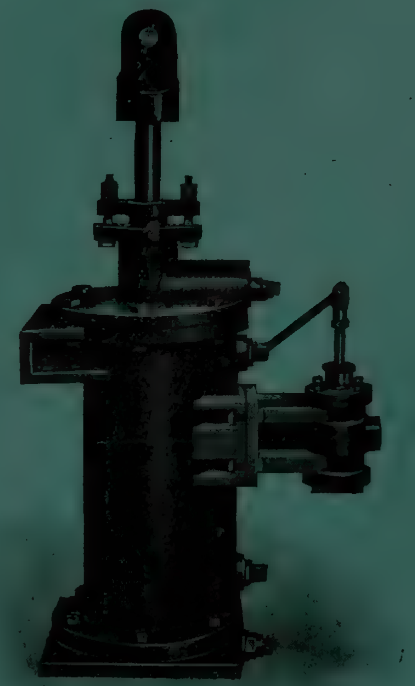
WELDLESS—The finished Chain is rolled direct from the bar without a weld.

STEEL has an approximate Breaking stress of 65,000 lbs. per square inch against 52,000 lbs. for the highest grade of iron, and where the Weldless Chain has 100 per cent. efficiency the welded article has only 60 to 70 per cent.

Write for descriptive matter, Breaking Strains, &c. and prices to

B. J. COGHLIN CO., Limited ∴ ∴ **MONTREAL**

Log Handling Machinery



The cut shows the type of cylinder we have been putting on all our kickers, loaders and canters for over four years. In that time it has been thoroughly tested in many mills and its value has been thoroughly proven.

Notice that all piping between valve and cylinder has been done away with.

Notice also the check valves in head and base of cylinder. These valves cause the steam to cushion in the cylinder at each end of the stroke, thus preventing the piston or the top or bottom head being broken.

The
Grand Triumph
Shingle Machine

is probably the best known horizontal shingle machine made in Canada.

We are the original manufacturers of this machine in Canada and the only manufacturers in this country making the genuine Grand Triumph machine.

It will cut upwards of thirty thousand shingles in ten hours, and it requires for its greatest capacity only ten horse power to run it.

It cuts all of the bolt into shingles—no waste at the end. Send for our catalogue.

---

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

Tooth bars are of refined machine steel.
No cast steel or cast iron filling.
They taper and are practically unbreakable.
Notice cross tie at base of bar.
Cylinders oscillate on steel trunnions.
Valves are large and areas ample.
All valves ground perfectly true.
Piston rods are extra heavy.
They never spring or bend.
Pistons all packed with double snap rings.
Speed controlled by throttling plugs.
Spring cushion floor plates with steel buffer blocks.
Ports are cast in the cylinder, avoiding leaky joints.
We build every machine required in an up-to-date band or cirular saw mill.

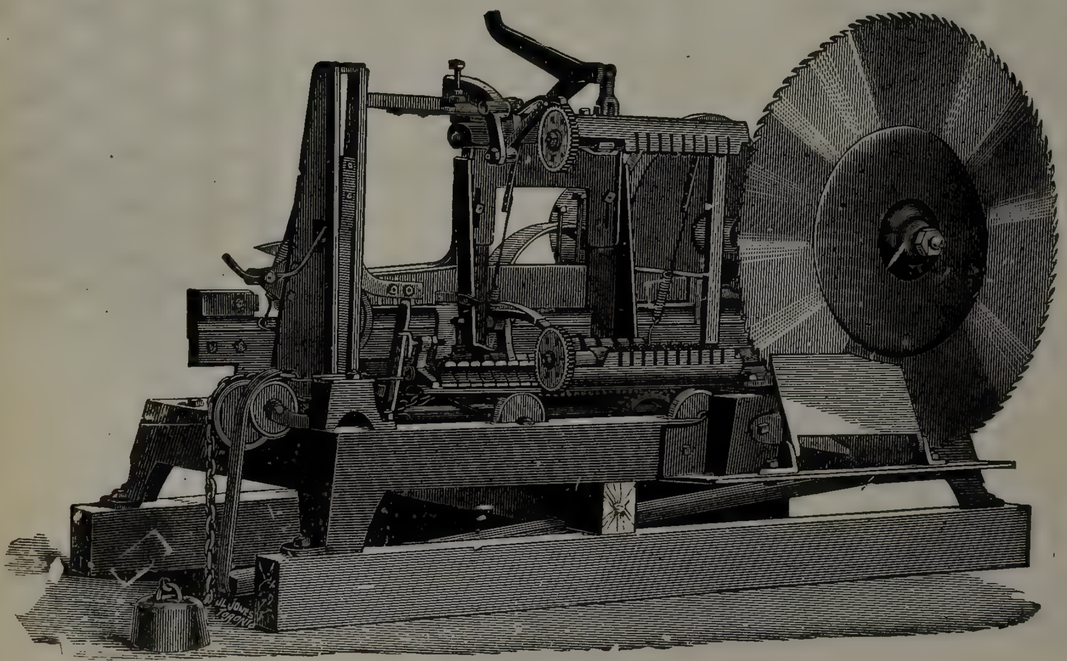
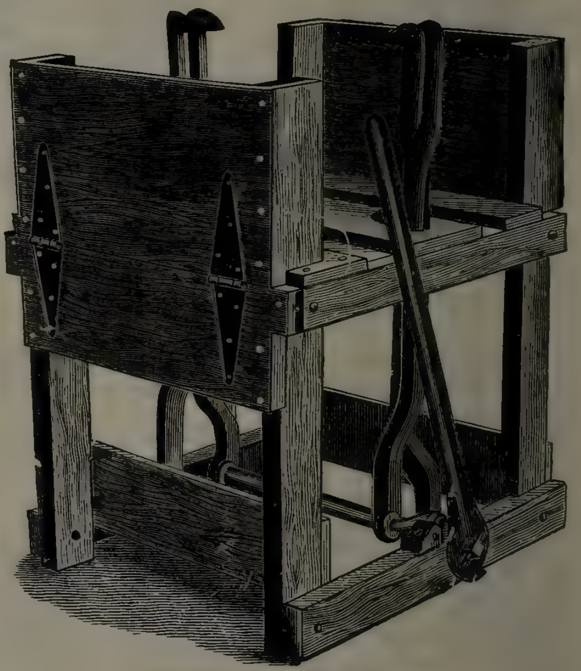
MAKING AND PACKING SHINGLES



"BOSS" SHINGLE MACHINE



SHINGLE PACKING BOX

SHINGLE MACHINE—It is perfectly automatic in its action. A patent brake relieves the machine of all jar when the carriage is stopped to change blocks. It is altogether the simplest in construction of any machine built, and combines so many advantages that it is far superior to any machine on the market. Write for Literature.

PACKING BOX—This box is suitable for 16 or 18-inch Shingles and is universally used by shingle manufacturers. The above cut describes it. Simple, handy and the greatest time saver ever brought out as a packing box. Send for literature describing this and our other saw mill machinery.

Simonds Saws

All there is to a Saw is STEEL, SKILL and STYLE.

The Steel that is in a Simonds Saw has meant that to supply it we had to build a Steel Mill comprising seven buildings which, with yards, cover 14 acres of land. This much for the demand for Simonds Steel.

The Skill that is in a Simonds Saw requires for its operation three complete factories, one at Fitchburg, Mass., one at Chicago, Ill., and one at Montreal, Que. The skill is the result of noting and accepting improvements in methods of making Saws, as long as Saws have been made in this country.

The Style that is in a Simonds Saw comes from a close study of the style of Saws necessary for best cutting results under varying conditions. Years of experience in the Saw manufacturing business has developed an ability to select the right Saw for any particular use.

The Price that the Consumer pays for a Simonds Saw entitles him to the benefits of Simonds Steel, Skill, and Style, these three together giving results or service which means profit.

If you are in the market for any kind of a Saw, Planing Knife, or file, send your order to our nearest office for our immediate attention.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

The Public's Duty in Preventing Forest Fires

A vigorous address upon the subject of the protection of the forests from fire was delivered recently by the Hon. W. R. Ross, Minister of Lands, for the province of British Columbia, at a public meeting held in North Vancouver. Although there is in the address as reported in the press, some measure of political praise for the party in power, in British Columbia, there is also much that is of the utmost importance to the people of British Columbia, and which may be taken to heart and studied by the people of all other parts of Canada where timber resources are of value. The address in detail is published elsewhere in this issue.

A point made in the address which should be taken to heart by the press of the country is the fact that they have in their hands the greatest existing power for educating the public to a proper understanding of their duties, in the matter of preserving the forests from destruction by fire. Of late years the press has done much to educate the public in this direction but it has also done more than its share to spread exaggerated reports of fires and thereby to bring the timber resources of the country into unmerited ill repute and also to place the blame in many instances where it does not properly belong. The natural course for an "excited correspondent" is to exaggerate a forest fire report. It should be the duty of the press not only to educate the public in the prevention and extinction of forest fires, but to educate their correspondents to report accurately whatever fires come to their notice.

This, however, is a small matter compared with the education of the general public. In this direction more than in any other lies the hope for the future preservation of the forests. Of late years a great deal has been done to teach the public its responsibilities, but the problem is one which can never be fully solved, because coming generations have each to be educated as they grow up. Every new arrival in the country has to be taught by experience more than anything else, that when he is in the woods he must never leave a fire of any sort unextinguished. The Hon. Mr. Ross in his address, brought out strongly the fact that the public are large shareholders in the forest resources of the country and that their pockets are directly concerned in this question. The timber resources of British Columbia are already paying two and a half million dollars a year to the government, a sum which goes a long way towards reducing the taxation upon the citizens of British Columbia. It is reasonable therefore that the public should be called upon to do many times what they have been doing in the past, in the direction of preventing forest fires.

The government of British Columbia has taken energetic steps to do its share and has met with remarkable success, yet, it is no exaggeration on the part of The Hon. Mr. Ross to say that "the annual burning up of British Columbia's forests and prosperity is about to begin. Careless campers will light fires in the brush and leave them to spread and devastate stretches of our choicest timbers. Conflagrations will be sown broadcast by defective locomotives, and logging engines, in spite of every effort of the government to detect and punish the persons responsible. Tenderfoot ranchers will 'take chances' and be virtuously astonished when the putting out of their fires costs thousands of dollars of public money. Quite a few lumbermen will look upon the spreading of fresh traps for fire as a necessary part of their daily business, and will have another summer's gambling with the God of Fire—staking their plant and timber against many a lighted match and butt end of the cigarette. Many an honest citizen will conceal what he knows about the cost of a bad forest fire, for fear of making an enemy of the man who started it, or in order to let the poor fellow down easy. People will stand looking on at forest fires wondering when the warden will arrive to fight them, or try to hold him up for fancy wages when he asks for help. At the end of the season, careless citizens of this province will have shot several million dollars worth of our national resources out of existence into smoke. All this will happen, and the reason for it will be—carelessness—just rank carelessness."

These are strong words, but there are few who will deny that they are thoroughly justified, not only by the importance of the timber resources of the country, but by the lack of public interest which has been displayed in the past. It will cost many thousands of public money and the greatest possible exertion on the part of the government and the public to reach any definite solution of the problem. That such expenditures will be justified however, is fortunately the belief of the public themselves, and no government will be free from blame which does no go to the limit in the matter of expenditure for so important a cause.

Canadian and U. S. Timber Statistics

Statistics of the exports of wood goods of Canada and of the United States, which are published elsewhere in this issue, and which cover the fiscal year ending March 31st, 1911, contain much information of interest to the lumber trade. The principal item of exports from Canada is that of planks and boards. The value of the exports of these to all countries was $21,509,769. By comparison with the exports of the year previous it is found that the exports of this description fell off by $1,928,559, or 10.78 per cent. The value of the exports of planks and boards to Great Britain was $1,659,701, and to the United States $15,948,791. To the Argentine planks and boards were exported to the value of $2,276,327. The total exports of deals, planks and boards and joists and scantling from Canada made a very creditable showing as compared with those from the United States. The total from Canada was $31,560,340, and that from the United States was $42,222,135. The exports of these lines from Canada to Great Britain were much greater than those from the United States, the comparative values being as follows: From Canada $10,282,127; from the United States $6,004,409. The exports of these classes from Canada to the Argentine were only about half as large as those of the United States to the same country, the totals being as follows: From Canada $2,465,587, from the United States $4,934,357.

In logs and round timber and other classes of timber, including firewood, sleepers, ties and piles and hewn and sawed timber, the total exports from Canada were valued at $3,115,247 and those of the United States at $16,008,291. Of these lines Canada exported to the United Kingdom $1,106,725 worth, and to the United States $1,990,074 worth. The United States exports of these classes to the United Kingdom were valued at $6,231,040.

The exports of lumber and manufactures of lumber from the United States to Canada during the year increased by $5,573,521, an increase of over 50 per cent. The exports of deals, planks and boards and joists and scantling from the United States to Canada during the year were valued at $8,328,728. The exports of logs, timber, ties, etc., from the United States to Canada were valued at $1,717,020.

The grand total of Canada's exports of wood goods for the year was valued at $52,005,241 and that of the United States at $89,152,650. It is interesting to note that the exports of wood for wood pulp from Canada to the United States for the year were valued at $6,092,715. In view of the contention that the United States does not need our pulp wood supplies, a claim which is freely made by those who are opposed to the reciprocity proposals, it is difficult to explain this import of pulp wood. The United States figures of the imports of pulp wood show a somewhat smaller quantity than the Canadian export figures show, the total from all countries being $5,917,765. The imports of wood pulp into the United States also indicate the growing dependence of that country upon foreign sources of supply. The total value of wood pulp imported by the United States was $19,492,178. By far the largest portion of this total came from Canada, the amount being $5,058,683.

Statistics for the month of April and for the twelve months ending with April, have just been issued by the Department of Trade and Commerce. They show that the exports of forest products from Canada for the twelve months were valued at $45,191,680, as against $47,775,471 for the corresponding twelve months a year ago, and $39,730,058 for the twelve months ending April, 1909.

Details of the exports of wood and manufactures of wood for the month of April are as follows: Exports of planks and boards, $753,376. Of this total the exports to the United States were valued at $521,046. Exports of planks and boards for the month of April, 1910, were valued at $906,074. Exports of spruce deals for the month of April, 1911, were valued at $302,428, of which $244,629 was to the United Kingdom. For the month of April, 1910, the exports of spruce deals were valued at $270,677. Shingle exports for the month were as follows: 1911, $92,196; 1910, $136,137. Shingle exports to the United States during April, 1911, were valued at $92,111. Exports of wood blocks for pulp, during April, 1911, were valued at $217,200, and during April, 1910, at $258,924. These exports were entirely to the United States. Exports of wood pulp during April, 1911, were valued at $269,567, against $704,289, during April, 1910. These exports also were entirely to the United States.

The total exports of wood and manufactures of wood, during the month of April, 1911, were valued at $2,000,086, against $2,147,573, in April, 1910. Of the total for April, 1911, the exports to the United States were valued at $1,376,035, and to the United Kingdom, at $406,333.

Imports of wood and manufactures of wood for the month of April, 1911, were valued at $1,316,757, against $1,145,170, during the month of April, 1910. Of the total for April, 1911, the imports from the United States were valued at $1,246,994, and from the United Kingdom, at $54,190.

Important Judgment on Meaning of "Timber"

When doctors disagree it is a poor lookout for the patient. Something to this effect might be applied in connection with the recent judgment of the Court of Appeal in British Columbia, upon the question of the meaning of the term "timber" when included in a contract for the sale of a timber berth. In a trial court of British Columbia, in the case of Edward F. Swift, A. D. McRae, and others vs. Lester W. David, judgment was given some time ago to the effect that the word "timber" in a contract for the purchase of a timber berth should include only such timber as under conditions which existed on the date of the contract, could be manufactured at a mill into merchantable lumber, saleable at a profit. Placing this interpretation upon the case the trial judge decided in favor of the plaintiffs, giving them a verdict for no less a sum than $171,000. Now the case has come before the Court of Appeal, and three justices of this eminent tribrunal have found that their colleague in the lower court was in error. No wonder, under the circumstances, that the plaintiffs and the defendant each thought themselves in the right and did not hesitate to go to law for the maintenance of their claims. The dispute arose over the sale of limits formerly belonging to Mr. David to the plaintiffs who were then forming the Fraser River Lumber Company. The defendant, Mr. David, guaranteed that the timber in question should at least be equal in quantity to the number of feet mentioned in the agreement, and that in the event of a shortage he would pay for it. The plaintiffs, suing upon this guaranty claimed that there was a considerable shortage and the trial judge practically accepted their estimates, and found a shortage of upward of 227,000,000 feet.

Much light upon the subject is thrown by Chief Justice MacDonald, in his decision. He says that the learned judge (in the lower court) had stated, in his opinion, that the witnesses on both sides were honestly endeavoring to give proper estimates. "The enormous discrepancy beeween them is, I believe, to be accounted for by their different interpretation of the term "timber" as used in this contract." The gist of the matter is to be found in this statement. After the contract had been drawn up, the parties to it gradually found that in reality, they had not understood one another. When so great an amount of timber, and so large a sum of money was at stake, the wonder is that a body of business men who had, in their other dealings been remarkably successful, should have failed to take the ordinary precautions, which suggest themselves in connection with all business transactions, no matter how large or small may be the sum involved. The essence of all modern business transactions, even the purchase and sale of small commodities in the retail store, is that a definite agreement be made as to the actual goods to be transferred and the price to be paid. All departmental stores insist upon delivering a receipt for even the most trivial article which crosses their counters. Why should lumbermen not adopt similar practice in the carrying out of their business transactions, which sometimes involve enormous sums of money? It has so often been the duty of the Canada Lumberman to remark upon this subject that it would seem almost as if further remarks were uncalled for. Unfortunately this is not yet the case. Lumbermen will probably continue to the end of time, upon occasions, to consider that they understand one another exactly, and therefore that there is no necessity for putting down in black and white the terms of an important agreement upon which they have decided. No more dangerous and absurd policy can be imagined. In the present case it has cost or is likely to cost the plaintiffs not only $171,000 which they confidently believed was owing to them, but a great sum in legal expenses. This unfortunate result is caused simply by the fact that the parties to the deal did not consider it necessary to enquire of the other side, what was meant when the term "timber" was used, and to have this definitely explained in the contract.

The same general principles apply to many transactions in the lumber industry, particularly to those which involve the sale of manufactured lumber, which, on account of the necessities of the case cannot be examined at the time the contract is made. A traveller taking an order for a car of lumber should always see to it that there is no ground for misunderstanding between himself and the purchaser, as to the exact quality and quantity of the lumber to be delivered. Unfortunately in this case also, lack of a definite understanding is frequently the cause of irritable disputes which sometimes lead to costly law suits. So indefinite is the general understanding of the various grading systems which prevail in the lumber industry in Canada, that we wonder at the frequency of carelessness of this sort. One would expect rather that because of the lack of uniformity among the grades, purchasers and sellers would be exceptionally cautious about the terms of their contract. There seems, however, to be some fatalistic tendency among the members of the lumber industry which prevents them on many occasions from adopting measures of precaution, which are so simple, and so necessary. All of this goes to indicate that the agitation among some members of the trade which has been noted of late in the Canada Lumberman, for the appointment of boards of inspectors to settle disputes between members of the trade, regarding the grades of lumber delivered under contracts is in the right direction.

The important point to the lumber industry, in the decision of the Court of Appeal of British Columbia, in the case referred to above, is its finding upon the meaning of the term "timber" in a contract for the purchase and sale of a timber berth. Chief Justice Macdonald's finding upon this point is summed up in the following:

"The plaintiff contended that this was a sale of a going business; that millmen, such as where the parties to this transaction, would have in contemplation when using the term 'timber' a meaning restricted to the purpose to which the timber was to be put, and that at a profit under the conditions, and at the prices then existing, and hence that anything not fit for the purpose was not intended to be included by them in the indefinite term 'timber.' This contention, to my mind, narrows down the meaning of the term to an extent not justified by the circumstances under which the contract was made. I think they had in contemplation everything which would give either a present or prospective value to the timber."

The Car Shortage Approaching—A Proposed Remedy

A meeting was recently held at Revelstoke, B.C., at which there were present a large number of representatives of th coast and mountain lumber manufacturers. The cause of the meeting was an important one and if the proposals which were made are carried out they will be of much advantage to the trade. For some years past, but especially during the prsent year, the manufacturers of British Columbia have had to submit to what they consider to be unfair competition from the manufacturers of the United States. Lumber entering Canada free of duty has been sold on the prairies in enormous quantities. There is a much greater over-production in the United States than there is in western Canada and the result is that the manufacturers of the States have great quantities of good lumber to sacrifice on Canadian markets and almost incalculable quantities of low grade lumber to slaughter in this country. For many years the manufacturers of Canada have tried to get the government to place a duty on rough lumber coming into the country. They have had no success. This year the situation has been especially aggravating and large contracts for many million feet of lumber have been secured by Washington mills.

In the face of this the manufacturers of Canada are now up against another complication which bids fair to test their patience to the limit. A tremendous crop is promised in the Canadian west and it is only a short time now until all the cars on all the railroads in Canada will be needed for the movement of grain. Shippers of every other class of merchandise will have to put up with delay. With the prospect for a good crop and the exceptional amount of building now in progress in all parts of Canada the manufacturers of lumber in the Canadian west who have been suffering from United States competition begin to see chances for a better market. Just at this time, however, it looks as though they will not be able to find cars to move their lumber when the demand is good. The situation is exasperating enough to try the patience of a saint.

The meeting which was held at Revelstoke had this question to discuss and took what whe held to be the only available method to avoid the difficulty threatened by the shortage of cars. They decided to ask the Canadian Pacific Railway Company to withhold until November 1 the collection of freight charges on lumber shipments made between now and the middle of September. If this concession were made by the railroad companies it would encourage prairie dealers to anticipate their fall requirements and order immediately while care are available. To show their good faith in the matter, the manufacturers have announced their intention of giving the dealers November 1st dating on all orders placed between now and the middle of September. With these two important inducements it is to be hoped that the dealers will join in the movement and do all they can to assist the manufacturers in their reasonable endeavor to stimulate trade. An additional feature which will shortly operate to increase the shortage of cars for shipment of lumber is the certainty of heavy movement of coal immediately following the settlement of the Crows Nest coal strike.

Another very important matter discussed at the Revelstoke meeting was the present lack of transportation facilities to new territory now being opened by branch lines in the northwest. An order of the railway commission put into effect last fall has discontinued the late practice of railway companies giving shipping privileges for necessities such as lumber and coal to settlers in territory on branch lines while under construction and not yet accepted by the board of railway commissioners. A strong plea was made to the chairman of the railway commission for relief in this respect, as the lumber manufacturers claim that not only are the settlers detrimentally affected, but the inability to supply this new territory is a serious handicap to the immediate demand for lumber.

Editorial Short Lengths for Busy Readers

The forest area of Canada has been so variously estimated by experts that the ordinary layman has difficulty in obtaining anything approaching accurate information. Bulletin No. 9 of the Forestry Branch of the Departmtnt of the Interior, published a few months ago, says: "The original timbered area, omitting semi-treeless lands, was approximately 1,900,000 square miles; 98,000 square miles have been cleared for stttlement, and 100,000 square miles have been cut over by lumbermen, leaving a timbered area yet untouched of 1,702,000 square miles. Assuming the average of 3,000 feet per square acre, there should yet remain 3,279,000,000,000 feet of timber in Canada at a very conservative estimate. On the contrary, the highest estimate that has been made, that given by the Conservation Commission, places the amount of saw timber and pulpwood in Canada at 494,600 million feet, and 1,100 million cords respectively."

The news from Miramichi points, that the heavy rains which prevailed during the last of June have assisted in getting out the logs which were threatened with being hung up, will be gladly received. A despatch from Newcastle, N.B., recently said: The extraordinary rains of the past few days have saved the lumber situation. Sinclair's have 180 men at work on their drives and have enough logs to run the mill all summer by day. Any more they can bring out will be used for their night shifts. Ritchie's mill at Newcastle is now assured of a full summer's supply, and the other mills are said to have sufficient logs, excepting Geo. Burchill & Sons, who will probably not run beyond August. Men are working on the Barnaby River drive and reports say that the lumber will all be brought out. An interesting report comes from Mersereau's Brook, on W. R. McCloskey's drive, beavers having dammed the brook at that plact, shutting off the water. The Miramichi Lumber Company's drive got full benefit of the beaver's work. The trade in the Maritime Provinces will be greatly relieved by the improvement in conditions. Had the rain been delayed much longer the results might have been disastrous to the industry in general.

Important Saw Mills of the Georgian Bay

No. 2. The Little Current Lumber Company—Modern Equipment and Skilful Management Result in Creation of Splendid Lumber Business

Max G. Witthauer, President.

Geo. T. Jackson, Treas. and Gen. Manager.

F. A. Lewis, Secretary.

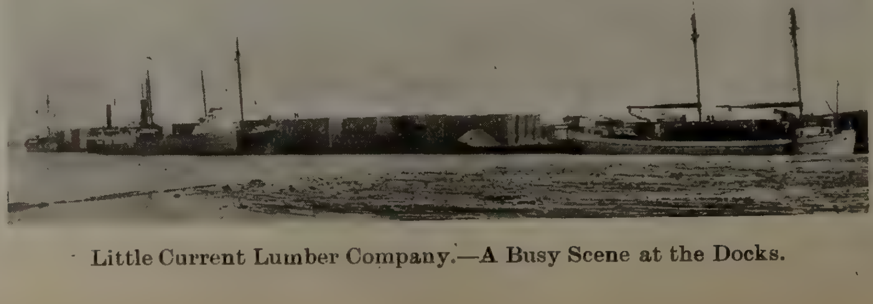
The town of Little Current, Ont., at which the mill of the Little Current Lumber Company is located is a progressive manufacturing and summer resort centre, situated on Manitoulin Island, at a point where the channel narrows down to a few hundred yards. It is the natural location for the terminus of the Manitoulin and North Shore Railway, which in the course of another year will be completed, from Sudbury to Little Current. The town itself is beautifully situated, and from a lumber manufacturing point of view, the location is exceptionally favorable. It is but a short distance from Little Current to the company's limits, which are situated on the north shore, near Beaverstone.

Little Current Lumber Company.—View of Mill from North.

Little Current Lumber Company.—View of Filing Room

The principal owner of the Little Current Lumber Company, is Mr. George D. Jackson, of Bay City, Michigan, the well-known lumber inspector. Mr. Jackson's business, as a lumber inspector is one of the most extensive in the district. Officers of his firm are employed by manufacturers, wholesalers, and retailers from many parts of the country and their decisions in regard to the grading of lumber for shipment are accepted without question, in all quarters.

The plant of the Little Current Lumber Company is splendidly equipped for the production of high grade lumber. The good quality of this product, in fact, is remarked by all who are fortunate enough to secure a share of it. One of the most important factors in the production of this quality is the splendid foundation of solid rock upon which the mill is built. For this reason the company has been able to secure for its machinery almost an unexampled smoothness of operation. The equipment of the mill consists of a double cutting band saw and a gang saw, in addition to a full equipment of edgers, trimmers, etc. The gang saw is a Wickes Bros. machine, and the band saw was manufactured by the M. Garland Company, of Bay City, Michigan. With this equipment the company are able to produce 140,000 feet of lumber per day of twenty hours. They run the mill both night and day throughout the season. The lath mill which is run in connection with the sawmill has a capacity of 35,000 lath in a twenty hour day.



Little Current Lumber Company.—A Busy Scene at the Docks.

The power equipment of the Little Current Lumber Company is composed of a battery of boilers with Dutch ovens. For the production of power, two engines are used, one propelling the band saw and the other driving the balance of the mill machinery. In a separate building the company operate an electric light plant with which they light both the mill and the town of Little Current.

In the mill there are about 125 men employed on the two shifts. The lath mill is operated under contract with a staff of twelve employees. In all, the

Little Current Lumber Company.—Gathering up Logs for the Pond.

company employ 150 men regularly and when vessels are being loaded the number is increased to about 200.

Interesting features of the company's equipment are its excellent piling yards and shipping facilities. The yards have a capacity of about 15,000,000 feet of lumber. The shipments are made entirely by water. When vessels are in the harbor to receive their loads, the scene is a very busy one. An interesting illustration of this is given in the accompanying reproduction of a scene along the water front, in which a number of vessels are shown at the docks. The lumber yard is generally acknowledged to be one of the best upon the Georgian Bay. It is situated upon an island 400 feet from the mill, a fact which is greatly commended by insurance companies.

The plant of the Little Current Lumber Company was formerly owned by W. & A. McArthur, of Cheboygan, Michigan, when it was taken over by Mr. Jackson, those interested in the company, in addition to Mr. Jackson were Mr. W. H. Sharpe, the well-known vessel owner, and Mr. Guy H. Moulthrop, the present owner of the Moulthrop Lumber Company, of John Island. These three bought out Mr. McArthur, and operated a mill for some years. Three years ago Mr. Moulthrop retired from the company, and Mr. Sharpe severed his connection with it one year ago. The present officers of the company are: President, Max Witthauer, Bay City, Mich.; treasurer, and general manager, George D. Jackson, Bay City, Mich.; secretary, F. A. Lewis, Bay City, and Little Current. Mr. Witthauer is well known throughout the Georgian Bay district, as one of the most competent lumber inspectors in the company of Mr. George D. Jackson. Mr. F. A. Lewis was originally connected with the banking business. Later he occupied the position of bookkeeper for the Ward Estate, which carried on the extensive lumbering operations of the late David Ward, of Michigan. He also occupied the position of bookkeeper for the Turner Lumber Company for a short time.

A large portion of the lumber sawn by the Little Current Lumber Company is under contract for other firms. They saw lumber for the Spanish River Lumber Company, the Turner Lumber Company, and a number of other well-known companies on the north shore.

Little Current Lumber Company.—Scene on the Tramway.

Although the shipments from Little Current have heretofore been all made by vessel, the companies located at this point are looking forward keenly to the time when the Manitoulin and North Shore Railway will reach Little Current. It will then be possible for the company to enter the rail trade, and it is certain that their products will then find ready markets in many an Ontario town.

Lumber Firm Hold Annual Picnic

R. Laidlaw Lumber Company 300 Strong, Invade Guelph and Capture Riverside Park — A Fine Day's Fun

The annual picnic of the R. Laidlaw Lumber Company, Toronto, was held on Saturday, July 8th. Some three hundred employees of the company took the special train which had been procured and travelled to Guelph, where the scene of the celebration was laid in the beautiful Riverside Park. The occasion was favored with splendid weather and the result was that a more successful picnic would be hard to imagine. During the journey to Guelph the time was enlivened by music on the bagpipes, provided by Messrs. Geo. Murray and D. E. MacPherson, who were indefatigable in their efforts to entertain the party. This, however, was not the only diversion provided during the trip. An event which was not upon the programme provided no end of amusemtnt for those who were not the victims of the sport.

When the train was about half an hour out of Toronto, a telegram was delivered to Mr. C. G. MacBeth which made the following acceptable proposal:—"Guelph, July 8th; offer services band, 10 pieces for 4 hours, $7. Reply by wire when we will meet train." In short order Mr. MacBeth and a few others had chipped in, and Mr. MacBeth sent a telegram as follows:—"Accepted, wiring money, meet train."

Upon arrival at Guelph no band was to be seen, but Mr. MacBeth received a letter which ran as follows:—"Many thanks for the seven dollars. We needed it badly. Here is the band. Count the pieces." Neatly enclosed in the letter were ten pieces of a hat band which had been cut up for the purpose. Mr. MacBeth is still looking for the perpetrator of the joke to get square with him.

When the picnickers had reached Riverside Park they lost no time in settling down to enjoy themselves. The principal event of the morning was a baseball game between representatives of the East and Spadina yards on one side and the West and North yards on the other. The game was a capital exhibition of keen baseball and resulted in a victory for the East and Spadina yards by a score of 6 to 4.

In the afternoon a splendid programme of sports was run off. There were races of every description and the competition was keen. At the conclusion of the races, the prizes were distributed and the lucky winners found themselves the possessors of unusually useful and valuable rewards. When the games had been concluded it was time for tea. After a good meal the picnickers serenaded Mr. Robert Stewart, of Robert Stewart, Limited, Guelph. Mr. and Mrs. Stewart and Miss Stewart received the visitors on their front lawn and while the guests were being introduced, the pipers paraded up and down in front of the house playing many an old time tune upon the pipes, which appealed to Mr. and Mrs. Stewart greatly.

The return trip commenced at eight o'clock and was if anything the jolliest part of the whole day's pleasure. A capital impromptu programme was provided, of speeches, songs, recitations, and selections on the bagpipes. The most interesting number was an address by Mr. Walter C. Laidlaw, who recently returned from a trip around the world. Mr. Laidlaw described many of the interesting sights he had seen during his journey.

Mr. A. C. Gordon made a splendid conductor of the games. Mr. J. Storey had the difficult task of umpiring the baseball match. He managed his work with considerable skill and came off the field alive and not much the worse for wear. The other officials of the day were as follows:—Judges, W. C. Laidlaw, A. E. Eckardt, and C. G. MacBeth; Chairman of Committee, W. Little; Secretary of the Committee, J. D. Copeland. The party reached Toronto at about 10.30 p.m. and most of them are already marking the days off the calendar until next year's picnic. The company's yards and factories were closed for the day.

The M. Brennan & Sons Manufacturing Company, Hamilton, Ont., have recently issued a couple of attractive little catalogues; one being of verandah materials and the other of door and window screens. The catalogues are well illustrated and indicate clearly the fact that the company are in an excellent position to furnish materials of the above nature on very short notice and of the highest possible quality.

Grading and Inspection—Pros and Cons

Complaints of Improper Shipments—A Bureau of Inspectors Proposed to Eliminate the Chronic Kicker—Too Many Kinds of Grading

Editor Canada Lumberman:—

"I see you have been publishing something about the inspection and grading of lumber in Canada. Some people think it would be no use to do anything about it, but I'll just tell you what occurred a few days ago in an office where I was calling. I was talking to a wholesaler, when a traveller for another large wholesale firm dropped in. He heard us discussing inspection and he got right in with some of his own ideas. He has been in the business a long time and ought to know what he is talking about, so I'll just tell you as nearly as I can how the conversation ran.

"He Got Right in with Some of His Own Ideas"

"Establish a definite system of grading rules for lumber in Canada," said the traveller, doubtfully. "I don't believe it could be done." I have been in the lumber business a good many years and I have been with one firm for twenty-three years or more. I think I have heard all about this grading trouble, from every point of view."

With a rather sympathetic glance in my direction which seemed to speak of pity for my inexperience in expecting that anything could be done to change the established order of things in the lumber trade in Canada, the traveller carried the discussion into a general consideration of the industry.

"You see I have worked in all the principle branches of the lumber buying and selling business," he said. "I spent a good many years on the buying end. Buying is a very different proposition from selling. You go into the manufacturing district. Perhaps you buy a lot of lumber at a mill, 20,000,000 feet or so. Perhaps you buy it in the log. There are all sorts of ways in which you can buy lumber. If you make a mistake of 50 cents a thousand feet it runs into many dollars on a large deal. Selling is quite another matter. It is child's play compared with buying. In good times lumber sells itself—if it is good lumber. In poor times, of course, it is only a good salesman who can make good.

"With all the buying and selling that I have done I have come up against this question of grades and inspection many a time. Why I remember the day when there were only three grades of lumber in Canada. When I came into the business in Ontario, first, a mill would put up mill run, mill culls and dead culls. That was all there was to it. I had had a good deal of experience with grades in the United States, and I began to introduce them here, as far as I could. I had a good deal to do with teaching inspectors of lumber in Ontario how to grade lumber. It was quite a job, I can tell you. The millmen did not want to be bothered with grades. They knew all about their own lumber and they wanted to have the whole say in the sale and grading of it. That didn't suit me. When I bought lumber I wanted to have half the say as to the particulars. I didn't want more than a half, and I wouldn't give any man more than half. When the millmen found that they could not sell me lumber without cutting and sorting the grades as I wanted them, they either let the business go or fell into line."

"Well, if you managed to introduce grading to that extent why couldn't the trade get together and go to the logical limit? I asked. "Why couldn't they draw up a definite set of grading rules, and appoint a bureau of independent inspectors to handle their disputes?"

"Perhaps you could do something along this line." was the reply. I mean you might have a bureau of inspectors and if you had, it would do a lot of good. But as to drawing up a definite set of grading rules it wouldn't work. It is different here to what it is in the United States. The mills here are much more independent than they ever were in the United States. In the United States to-day, the inspectors are independent bodies who give rulings according to an actual set of very definite grades. When a dealer gives an order for a certain grade of lumber he knows exactly what he will get, and he knows exactly what it is worth to him. He takes no chance, except as to the honesty of the firm he buys from. He knows that the inspectors will protect him if he doesn't get a square deal. The manufacturers saw, early in the history of the lumber business over there, that the wholesalers and retailers were too important and too strong a body to be dictated to in regard to grades, and they fell in with the uniform grading and inspection idea. The result has been to their benefit, as well as to the benefit of the whole trade, but it is another story in Canada."

"What's the difference," I asked. "Why could not the wholesaler and the retailer over here use their influence together and persuade the manufacturer that it is to his benefit to assist in removing the uncertainty and trouble which result from the lack of systematic methods?"

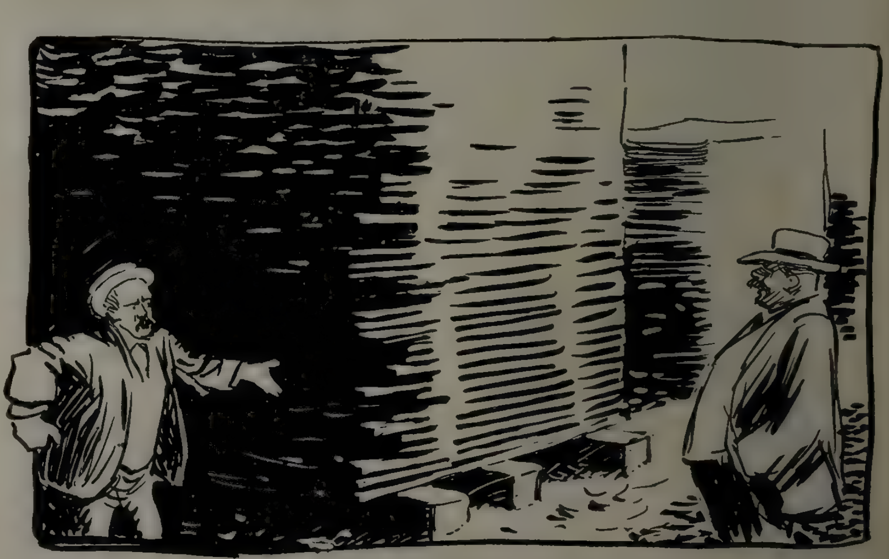
"Well, it looks at first glance as if it could be done alright," the traveller replied. "But the manufacturer is so independent. He knows all about his own lumber. He has his regular customers who know his lumber well and buy it on his word. He has so little difficulty in disposing of all his cut that he cannot figure on any benefit to himself, or to the trade by adopting a definite set of uniform grades, or submitting to the decisions of any independent bureau of inspectors. If a set of grading rules were adopted all these mills would have to change their systems, and have their inspectors educated to the new methods. An inspector at a mill is a hard man to train. He has learned by long experience what is needed in the way of grading at his particular mill, and it would take a long time to teach him to use new rules."

"But it must have been the same in the United States, at one time," I said.

"No it was not. That is the difference. In the United States the manufacturers never reached that state of independence that the manufacturers in Ontario have reached to-day."

"Well what about the grading that is in force at the different mills, here to-day. Aren't the rules at the different mills, to a large extent, based on the same general lines?"

"Yes they are, but take the big manufacturer and the little manufacturer they may both have logs to get out and the big manufacturers' logs may be better than the little one's, and he may be able to get $3.00 a thousand feet more for the lumber cut from them, than the little fellow can get. But the little fellow knows that by cutting his logs up in special ways and selling to a customer who is not too particular about grades, he can pretty nearly come out even with the big manufacturer. I don't mean that the little manufacturer is not square, any more than anyone else in the business. Generally speaking he is as square a man as there is in the business. I am just supposing a case and showing you how a man can make more out of his



"Some Men Can Only See the Bad End."

lumber because of the uncertainty in grading than he could if the grading were definitely settled, and inspectors were appointed to look after disputes."

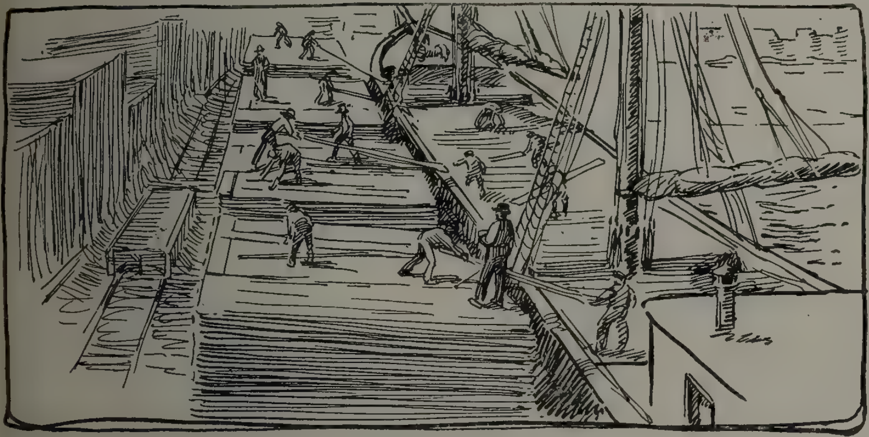
"Well, but the manufacturer who gets more for his lumber than what it is actually worth is harmful to the trade, isn't he? Wouldn't it be a good thing to have him made amenable to inspection by an independent bureau?"

"You are right there, sure enough, and I think I would like to see a bureau of inspectors appointed in Ontario. It would take a good deal of money though. The men would have to be paid about $3,000 a year and expenses, each. Perhaps two men could handle the business at first. One might work from London and the other from Toronto, and they could cover a lot of ground between them. They would have to be practical, and capable, and know all about the value of lumber, and then they would have to be unquestionably honest."

"It would not be hard to find men in the lumber trade to do the work," I ventured.

"No, it wouldn't be hard. I know a couple of men who could do it alright. If the work got started and the dealers all knew that complaints would be settled on their merits there would soon be fewer complaints."

"That's right, too," said a wholesaler, who had been listening quietly throughout. "Why, I know a firm who regularly made complaint for shortage on every car of lumber they bought from us. We had to stop trading with them, but for a long time they held us up. Once I made sure that there was no shortage on a particular car. I had one of their own men measure the lumber as it was put on the car, and then when the lumber was received, a claim was made for about 380 feet shortage.



Counted 59,000 feet in one hour

"Why," I said, "your own man measured that lumber into the car."

"Oh! is that the car he measured?" was the reply. "I must have made a mistake."

"The claim was withdrawn and we never had any more business with that man.

"That class of dealer would soon mend his ways if he found that the inspectors would settle the claims on their merits. There would not be any use in making unfounded claims. The wholesaler would be saved all the trouble which arises out of claims of that sort."

"Yes, I'd like to see it tried alright," chimed in the traveller. "The man who was found to be in the wrong would have to foot the bill of course, and he would soon be careful not to make any complaint unless he believed he was in the right. Complaints would soon become much scarcer than they are to-day.

"There are some men in the business to-day who don't like to put through a deal without entering a complaint and having a little argument about it. They think an argument is part of the business. It wouldn't seem like business to them at all, unless there was some haggling over the details."

"I know lots of those fellows," said the wholesaler. "Some men never can see anything but the bad end in a shipment. I sold a car of lumber once to a fellow and I found after the shipment had been made that we had put in a considerably better quality of lumber than we should have. But we had also put in a few shorts which were not included in the order. I don't remember why the shorts were put in. Perhaps we had a few to get rid of, and thought that the customer could use them alright, and wouldn't mind taking them.

"It was not long before we heard from that fellow. He complained of the shorts and wanted an allowance made for them.

"Well, I knew that we had put in too high a quality of lumber in the rest of the car. But he didn't see this. He only saw the shorts, so I went over to his place and we looked over the lumber together. He pointed out the shorts, and thought he had me, but I pointed out the high quality of the shipment in general, and showed him that he got much more for his money than he was entitled to. That ended it and he withdrew his claim. He was one of those men who are constitutionally unable to see the good end in a shipment of lumber which they are buying, unless it is pointed out to them, but he had a special faculty of spotting all the shorts.

"If a bureau of inspectors were appointed by the trade to handle disputes this fellow's defective vision would soon be corrected."

The discussion continued along these lines for a time and then turned into a general talk upon trade conditions. Then it came back to the matter of lumber culling.

"How much could a couple of men handle, in the inspection line?" I asked.

"They could handle a good deal. I think they could do the whole business from the first," said the traveller. Once I knew a man who was said to be the best culler in his part of the country. He claimed to have counted 600,000 feet of lumber in one day."

"600,000 feet?" queried the wholesaler. "Let's see, that would be 60,000 an hour for a ten hour day, or 1,000 feet a minute."

"Yes, that's the way it figures out," said the traveller. "So I asked him if he counted it all. 'No,' he said. He only counted about 150,000 and estimated the balance.

"That set me to figuring on it myself and one day I made a test. We had a shipment of lumber to make from a four-pile front, onto a vessel direct, and they were four piles deep. We had a large force of men to handle the lumber, and I counted for the four piles. I had three other men watching the shippers to see that they did not load anything I hadn't counted. I counted up a course on one pile, then moved along to the next pile, and so on, and by the time I counted a course on the fourth pile, the course on the first pile was loaded, and I returned to that pile. I kept it up for an hour and had then counted a little over 59,000 feet. But I couldn't keep it up any longer. One hour was enough.

"That is just to show you what a man can do if he is put to it. Probably two men would have a busy time looking after all the complaints for the Ontario trade, at first. In time, however, the complaints would let up a little, and they could probably handle it alright. Say $10,000 a year would be needed to pay salaries and expenses for a bureau of inspectors. That would only mean a cent or two a thousand feet, on the the output of the mills concerned. It would really not amount to any tax, and would relieve the trade of an incalculable amount of worry, and waste of time."

"That seems to be the gist of the whole situation," I said, as I took my hat to leave. "It would not give anybody anything to worry over, except the man who made a wrong complaint, and it looks as if it was badly needed to improve trade relations generally."

J. C. WOOD.

Timber Statistics from Quebec

The following comparative statement of timber, measured and culled to date, is furnished by the Supervisor of Cullers, office, Quebec, under date of July 5th:—

	1909 Cubic Feet	1910 Cubic Feet	1911 Cubic Feet
Waney White Pine	583,000	236,240	440,720
White Pine	51,240	9,640	
Red Pine	5,400	4,760	6,240
Oak	408,160	67,040	14,120
Elm	61,880	224,680	158,960
Birch and Maple	45,080	40,680	58,800
Ash	480	720	80

Cannot Afford to be Without Canada Lumberman

The following letter is typical of many others. It demonstrates the value of the "Canada Lumberman" both to readers and advertisers:

Timber Defined by Court of Appeal

Important Law Suit in B.C. Results in Decision That "Timber" Includes Future Values — Detailed Decisions by Three Judges.

British Columbia jurists decide that no question of marketing timber is involved in interpretation of term.

The celebrated case of Edward F. Swift, A. D. McRae, A. D. Davidson and Senator Jansen vs Lester W. David of Seattle which has been in the courts of British Columbia a long time, has been decided in the Court of Appeals for the Province in favor of the defendant. A decision of much interest to the lumber trade of the Province has been handed down by the Chief Justice of the Court of Appeals and two associate justices in connection with the case. The question at issue was the meaning of the word "timber." This subject is of such importance that a brief outline of the case and a report of the decision of the three judges is published herewith.

In 1907 Mr. David sold the Fraser River plant and its timber holdings on Vancouver Island and on the mainland, and the plant of the Anacortes Lumber & Box Company at Anacortes, Wash., to Messrs. Swift, McRae, Davison and Jansen. The purchase price was $750,000, of which a small part was paid down, the purchasers agreeing to pay $25,000 a month. The payments were continued until the panic in 1907, when extension of time was granted by Mr. David, but eventually the payments ceased, and Mr. David brought suit in the United States federal court to enforce payment. He was successful in this suit and secured a judgment in his favor, but in the meantime the purchasers brough suit in the British Columbia court claiming a shortage of timber on the tract in the deal. The trial judge gave the purchasers a verdict for $171,000 against Mr. David. An appeal was taken to the court of appeals. The purchasers had contended that the timber fell short of Mr. David's guaranty of 1,030,000,000 feet by 227,000,000 feet, while Mr. David claimed that there was actually 500,000,000 feet in excess of the amount in the deed.

The opinions of the judges given herewith in detail are based on the ground that "timber is timber" regardless of whether it was possible to market it at the time of the purchase was made, at a profit or not, figuring that the purchasers probably had the future in mind, as is considered customary frequently in buying timber holdings. The decisions of the three justices of the court of appears follows:

Judgment of Chief Justice MacDonald

The defendant agreed to guarantee that the "timber in question shall at least run equal in quantity to the number of feet shown in the attached statement," and that "in the event of all the tracts from a cruising or other verification failing to reach the quantity represented in the attached statement," the defendant would pay for the shortage. The plaintiffs sued on this guaranty and attempted to prove the shortage by the evidence of a number of timber cruisers, as they are called in the trade, who had estimated the timber on the various tracts. The learned trial judge accepted these estimates as substantially correct, found a shortage of upward of 277,000,000 feet and gave judgment for $171,500. The defendant's witnesses estimated the timber on these tracts and upwards of 500,000,000 in excess of the quantity guaranteed. The learned judge has stated that in his opinion the witnesses on both sides were honestly endeavoring to give proper estimates. The enormous discrepancy between them is, I believe, to be accounted for by their different interpretation of the term "timber" as used in the contract. If I come to the conclusion that the plaintiff's witnesses made their estimate on the right understanding of that term then I think the judgment below ought to be sustained; but if, on the contrary, these witnesses have excluded from their estimates timber which would probably fall within said term on a right construction thereof, then the plaintiff's case fails. The onus was upon the plaintiffs to prove a definite shortage, as definite as could reasonably be proven by the only means which I think were in contemplation of the parties; namely, by estimates to be made of the timber in the forests, standing or down, by timber cruisers. The quantity reduced to board measure was to be ascertained in that way, and not by actual measurement of each tree. The only question then is, did the plaintiffs' cruisers include all the trees or wood they should have included in their estimates? If they did not, then in my opinion the plaintiffs must fail, as in that case there is no evidence of shortage, and the plaintiffs having rested on their interpretation of the agreement, or on that of their witnesses, must take the consequences.

The plaintiffs, who had professional assistance in the drawing up of the written agreement, while the defendant had none, and who neglected to define what the term timber was meant to include, now contend, if I have not misunderstood Mr. Davis in his argument before us, that the only timber to be included in the estimates was such as under conditions which existed at the date of the contract could be manufactured at a mill into merchantable lumber, salable at a profit, and if I do not misapprehend the reasoning of the learned trial judge, he has adopted practically the same interpretation. The crucial tests applied by him were "a fair cutting estimate," and cost of logging and market price under present conditions.

The plaintiff's cruisers proceeded each in his own way to estimate the timber on the particular tract or tracts to which he was assigned, and followed his own bent as to what ought not to be included within the term timber. The result is illustrated by comparing the evidence of several of the plaintiff's cruisers. Rankin included in his estimate only such timber as could be put on the market, which I take to mean in the shape of sawlogs and under present conditions and excluded what he considered inaccessible at present prices. Easton made deductions for timber which he considered defective in quality; Faulkner excluded trees fit for the manufacture of telephone and telegrph poles and piling. This witness made a preliminary cruise before litigation commenced, and found in one section 6,600,000 feet; but in his final cruise for the purpose of this litigation 3,150,000 feet only. It is only fair to say that a preliminary cruise is not intended to be as accurate as a final one, but still the discrepancy is out of all reason. This cruiser in another section found 800,000 feet, while McRae, another of the plaintiff's cruisers, found in the same section 1,520,000 feet. McRae deducts a percentage for what he considers inaccessible timber. Hooker estimates only what he thinks is fit to cut, which I take it means for sawlogs. Cilkey makes deductions for breakage and other nonmerchantable timber. The deduction for breakage was because the witness thought that in felling the trees a considerable number of them would break owing to the roughness of the ground, as if the timber was to be delivered in logs at the mill and was not to be estimated as standing upon the land. Ramer estimated on the basis of what he thought would be taken off the land at the present time; Sheehan, what a man could log and get back his money for. This witness also makes deductions for breakage. McLarty took all that could be profitably logged at the present time; and Myers, who was a logger, estimated the fir which he thought fit to cut, the cedar, and some of the hemlock; discriminating against hemlock because at that particular time hemlock was not in demand. It is apparent that he estimated the timber in the manner in which it would be estimated by a logger who cuts the merchantable logs for sale to mill men and thus no further interest in anything left. Some of these witnesses estimated poles and piling separately; others did not include that class of timber at all. None of them included railroad ties and cordwood.

An attempt was made on behalf of the plaintiffs to show that the term "timber" had a trade meaning or a local customary meaning such as was placed upon it in this litigation by the plaintiffs. The want of unanimity among the witnesses above referred to would tend to destroy this theory; but even the witnesses relied upon by the plaintiffs to prove such trade or customary meaning specially completely failed to do so. Alexander, an experienced lumberman, who has carried on business in this province on a very large scale, said: "I might buy timber that would not be worth getting out at that particular date, but at some"—(here he was interrupted). This witnes further said that he had timber which he could not get out at present prices, yet he called it timber. He said that poles and piling are not timber in a milling sense, but that they have a value in a business sense, as also has cordwood; he had limits that had been logged over, the licenses for which were still being kept alive by the payment of fees because he expected to go back for the balance of the timber which was not merchantable today. Patterson, another witness, said that piling and poles have a value and that trees fit for the making of skidways would be strictly considered timber, but he would not want it estimated in a cruise if he were buying. Parkes, another witness, would discount hemlock because not much in demand at the present time. All this is matter of individual opinion and not of what is generally understood.

An effort was made to put in evidence certain declarations stated to have been made by the defendant to the plaintiffs at the time the contract was entered into. The witness A. D. McRae, one of the plaintiffs' was asked by Mr. Davis:

Q. You were going to tell what Mr. David told you was the usual thing in the lumber business in British Columbia.

A. He said that in his guarantee he would guarantee his statement of April 30, 1907 (the statement in question) "that the timber in that statement would cut out that many feet in logs as they were operating at that time in British Columbia."

And again:

A. He said that the minimum log they were taking out was 16 inches at that time.

And it is also stated in this evidence that defendant "talked always of green standing timber." This evidence was admitted subject to objection, and with deference I think eroneously admitted. It was an attempt to add to the written agreement. Mr. Davis further contended that this was a sale of a going business; that millmen, such as were the parties to this transaction, would have in contemplation when using the term "timber" a meaning restricted to the purpose to which the timber was to be put, and that that purpose was the manufacture of lumber to be sold at a profit under the conditions and at the prices then existing, and hence that everything not presently fit for the purpose was not intended to be included by them in the indefinite term "timber." This contention to my mind narrows down the meaning of the term to an extent not justified by the circumstances under which the contract was made. Why should we infer that the purchasers were men of one idea only; that they did not care for any profits other than those which would flow from the manufacture of lumber; that they were not alive to everything which gives a value to timber limits, whether capable of being sawn into lumber or not; and whether capable of being utilized at the present moment and under present conditions or not? I think they had in contemplation everything which would be present to the minds of the holders of timber rights which would give either a present or prospective value to the timber; the facts that forests are being rapidly exhausted, that prices of their products are increasing, and are likely to increase very greatly in the future; and that the increased demands will bring into the market classes of lumber and of other products of the forest that are now not considered marketable; in other words, inferior in grade to that which now readily finds a market. The parties may also have had in mind the increasing facilities to be provided by railways now in the course of construction, or in contemplation, which will make accessible, or help to make accessible tracts of timber which are at presentent inaccessible. True, the plaintiffs' principal object was the manufacture of lumber, but that does not exclude their contemplation of all the incidental profits and advantages to be derived from their holdings, advantages which may not all accrue at the present time, but may well accrue during the period over which in the ordinary course of business the operations of the plaintiffs will extend. The defendant provided for the future as well as for the present when he acquired the limits in question and the advantages which would accrue from such ownership passed to the plaintiffs under the term of the agreement.

There is another phase of the matter not unworthy of notice. The timber was valued in the inventory at from 50 cents to $1 a thousand. It is clear from the evidence that some of it was worth a great deal more than $1 a thousand standing in the tree. It is too much to assume that the parties here ignored the fact that all limits contain good, bad and indifferent timber; while a certain proportion of the timber on these tracts was of little or no value, another proportion was of a value beyond that specified in the inventory. The plaintiffs virtually claim the benefit of getting the high class timber, and being paid by defendant as for a shortage figured out by rejecting the poorer class or that which at the moment could not be manufactured into a salable product. The evidence of the plaintiffs' witness shows that milling companies may and do take off part of the timber for present purposes, and hold the balance either for the future use by themselves or to dispose to others for the manufacture of poles, railroad ties, piling, cordwood, or anything else fit for the market. According to plaintiffs' contention this marketable commodity is not an asset, and is was excluded in the estimates of the plaintiffs' cruisers.

Another point which may be noticed is that under the legislation of this province the term timber includes not only sawlogs, but poles, piling, railroad ties and cordwood, and I think some other classes. The timber those parties were dealing with was held under license lease or grant from the Crown, subject to a royalty when cut upon the different classes of timber mentioned above, and, with the exception of one or two of the classes, reduced to board measure. This is the "timber" that is bought and sold in a business way constantly and I find no circumstances in this case which would lead me to a conclusion that the parties dealing with respect to timber held under such license, lease and grant intended a more restricted meaning to be placed upon the term "timber" in the contract than it bears generally in connection with the acquisition or sale of timber lands generally.

I think the appeal should be allowed and the action dismissed with costs.

J. A. MacDONALD, C. J. A.

Judgment of Justice Galliher

In this case the learned trial judge has adopted the standard of cruising carried out by the plaintiff's witnesses, and rejected the defendants' cruise entirely.

The action is based upon a guaranty contained in an agreement set out in pages 2 to 10 in the Appeal Book, and turns largely upon the interpretation of paragraph 3 of that agreement.

The onus is upon the plaintiffs to show that there is a deficiency in the quantity of timber on the limits as guaranteed by the defendant, and this is sought to be established by the evidence of a number of timber cruisers and other witnesses as to what should be regarded as timber within the meaning of a contract such as the one before us..

The plaintiffs' cruisers based their estimate upon what could be logged off and put upon the market at that time at a profit, and that is the standard adopted by the learned trial judge.

Had these cruisers made an estimate of all the timber over a certain diameter at the top, and then specified what amount was rejected by them, and their reasons for such rejections we would have something to guide us, but instead almost all of them went upon the limits decided in their own mind what should be counted and made a return of that only; in fact, constituted themselves arbitrators.

To illustrate: Supposing a cruiser had gone to a certain area and reported that there was, say, 100,000,000 feet of timber, but that 35,000,000 feet of that should be deducted, and give his reasons therefor, the court would have something definite to go upon, but instead, he simply returns so much which he himself has decided comes up to his standard and disregards the rest.

It does not seem to me that the plaintiffs should succeed on such evidence.

Moreover, I do not agree with the construction put upon the word "timber" by the learned trial judge. As applied to the curcumstances here I think it is too restricted.

A mill owner with a large plant carrying on extensive lumbering operations has in view not only the procuring of timber areas for their present requirements, but for a considerable period in the future, and to say that no timber should be included under a guaranty such as is here given except such as could be presently cut and placed upon the market at a profit is to my mind giving to the word "timber" a meaning that was not in the contemplation of either party to the contract and does not fit the circumstances of this case.

It may be on the other hand that the defendant is giving to the word a too extended meaning, but in the view I take of the case that need not enter into our consideration, for the judgment must stand or fall upon the evidence of the plaintiffs' own witnesses, and if that judgment is based as I think it is, upon erroneous premises, it can not stand.

I would allow the appeal with costs.

W. A. GALLIHER, J. A.

Judgment of Justice Irving

In my opinion the learned judge proceeded on a wrong principle in accepting the estimate of the plaintiffs' witnesses, and in taking the view of the actual operator who only looks at the present conditions as to cost of logging and market price.

The defendants did not agree to any such stipulations in favor of the purchaser, and I do not see why we should nok read them into the contract.

In making selection of timber areas the ability to supply immediate demand at a profit can not be the only guide. Prices will change, facilities for logging will improve; what today is regarded as inaccessible may next week be easily brought to the mill. Their promise was that the "timber on the ground" should be at least equal in quantity to the number of feet shown in the statement. In other words, the contract may fairly be read as if the plaintiffs said "We are willing to abide by your views as to suitability of timber areas and to accept your selection of limits, provided those limits contain the timber you say they do." As the defendants had or were supposed to have opportunities to make good selections there is nothing unreasonable in this view when we consider the plaintiffs were taking over the whole concern.

In reaching an estimate I do not see why the 16-foot basis is to be rejected. The competition in business will force timber men in this province to figure more closely than in the past, and as there was no standard agreed upon, other than a reasonable standard, I do not think we should now read into the contract any words not agreed to. Poles and piles I am inclined to think were properly rejected—but it is a doubtful point. On the whole I think the evidence establishes that the timber was on the areas scheduled in the statement—perhaps I had better say I am not satisfied that there was a shortage.

I would allow the appeal and dismiss the action.

P. A. E. IRVING, J. A.

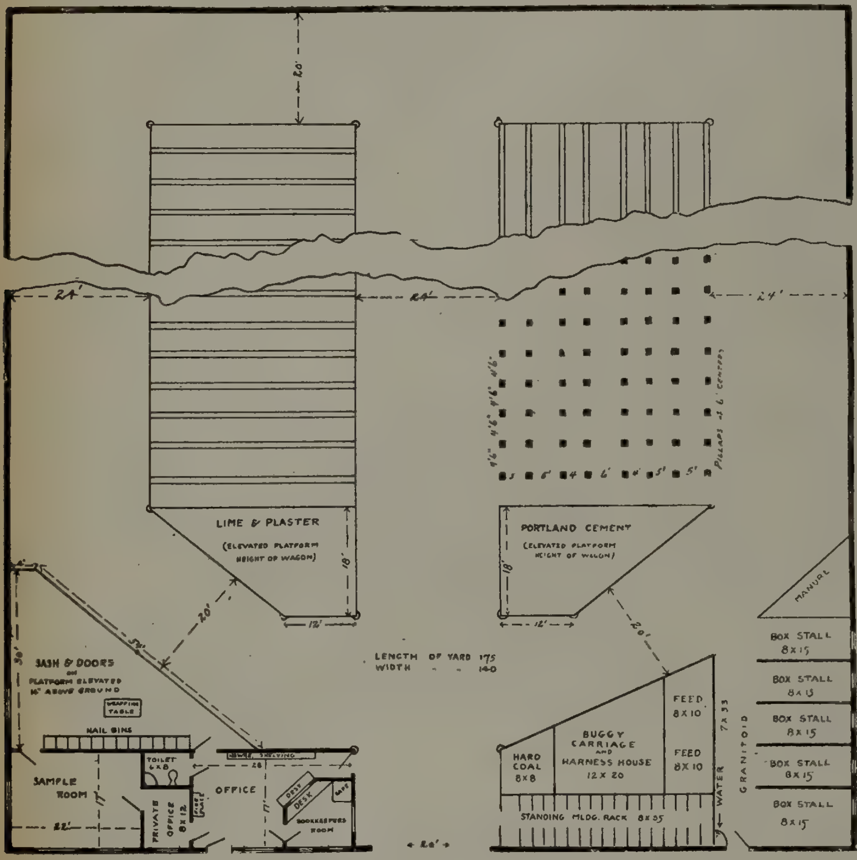
The Retail Dealer and His Problems

Shed and Yard Design—Knowledge of Shed Details

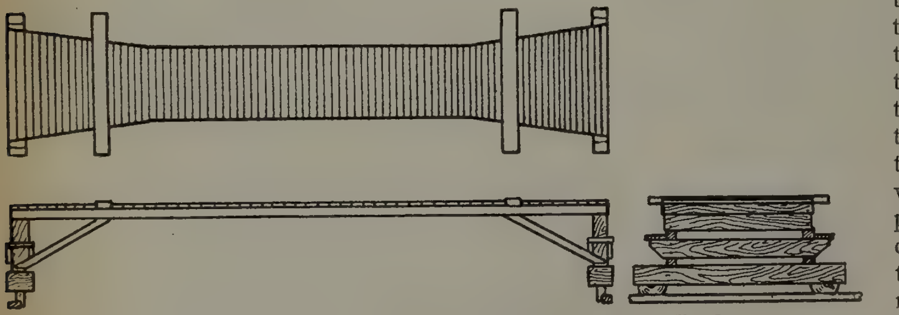
Designing a Retail Shed and Yard

The designing of a shed for a retail lumber yard is a problem which is continually coming up for solution. The accompanying illustrations show the solution as it has been worked out by a firm in the Southern States. In referring to the plan the St. Louis Lumberman says:—

In the first place the shed was erected with the idea of having only one entrance, the object of this being that the man in the office might see every load that went in and came out of the yard, with no chance for a customer to carry out a few pieces of lumber or moulding on his shoulder without being seen. Owing to the ground space (140x175 feet) the arrangement of the shed, as shown by the accompanying sketch was in many ways a necessity and the builders think they have utilized every available space, all portions of which are within easy access to loading and unloading wagons.



Floor Plan of Retail Shed and Yard.



Detail Drawing of Travelling Bridge in Retail Yard.

The main door of the shed is 20 feet in width. All the main alleys are 24 feet and the cross alleys 20 feet, so it is evident that alley room, which is so desirable, is sufficient in this shed, and the piling space is wide enough to accommodate pieces 34 feet long and by arrangement of piling sills, as shown in the diagram, any length of piece from 5 feet up can be piled without danger of springing. Usually the weakest portion of a shed is the foundation. With this idea in view, when the shed under discussion was constructed the foundation question received the greatest attention.

The shed building is entirely surrounded by a concrete wall 8 inches at the top and flaring to 18 inches at the bottom, though this wall bears no weight except that of the sides and the roof The foundation for the sills on which lumber is piled consists of pillars set in the ground to a depth of "hard pan." These pillars are 8x10 inches at the top and flare out at the bottom to 14x16 inches. They are set 4 foot 6 inch centres, facing the alleys, and are arranged through the cross sections as shown in the sketch herewith. The 6x8 sills, built up of 2x8's, rest solidly on these pillars, and these sills carry the entire weight of the lumber on the first, second and third decks, the second and third deck being reached by a runway.

The ground on which this shed was erected was clay and gumbo. On soft, loamy dirt the sills might be placed between the pillars so as to relieve some of the weight of the first deck. At each corner inside the building a round cement post set at an angle of about 45 degrees, was moulded into the ground, up, and around, the corner of the framework, so as to act as a guard against wagon wheels striking the corners.

The plan shows arrangement of office and comment on this is hardly necessary. One feature, however, that we consider worth mentioning is the fact that the nail bins are just outside the office, the object of this being to avoid the dirt and shut off the noise, for those that have had experience know that it is almost impossible to carry on a conversation when nails are being emptied out of a keg or weighed up on scales. Only shelf hardware is kept in the office.

The Company state that their standing moulding (a fine feature) is a decided success and that they would not think for a moment of going back to the old method of handling this class of stock.

Something may be seen in this shed which has never come to our notice. It is the traveling bridge, a detail sketch of which is shown. Most yards are equipped with from one to two bridges to give easy access from one second deck across the alley to the other, but this is the first traveling bridge that has come to our notice. Aside from being a great convenience as a bridge, they find it invaluable in collecting odds and ends to be loaded in a wagon when the customer comes in, taking for granted, of course, that his wants are known before he drives his wagon into the yard. From 1,000 to 1,500 feet can be piled on this bridge. It can then be pushed from one end of the alley to the other, easily by a boy.

There are many other fine features of this model yard which are well worthy of careful consideration and also imitation, and a close study of the views here given, more especially the detailed plan, will well repay the most conscientious care and study.

A Question of the Present Day

I have often conjectured whether the average retail lumberman of the present day is as well acquainted with his yard as was the dealer of fifteen or twenty years ago, writes C. H. Ketridge, in the Mississippi Valley Lumberman. This question, I think, originally came into my mind because of my own experience during the past ten years of doing business in a city yard. I found when I came to the city that practically all of the inquiries and orders came through the telephone. Therefore, my presence was needed at the office continually all during the day. So that with one or two walks through the shed during the day to look at the stock, or to attend to something that required my personal attention, I had not much to do with the detailed work of the yard. Fortunately I had a yard foreman who knew as much about lumber as I did and was thoroughly competent and faithful to see that everything was in place and the orders correctly filled. In the minor matters of attending to the horses and their feed and keeping everything in repairs. I let him have free rein to do what was necessary. He was a man of unusually good judgment and if he possessed the confidence in himself in the same degree, he would not have been a yard man all his life as he has been. In many respects I honored him as much as any lumberman I have ever known, because of his absolute fidelity and faithfulness in the sphere of his duties to my interest. No man can do more in his sphere of life than he has in his. I don't care how high a position a man holds, nor how low it is, the principle of fidelity to his trust is the same, and I honor the man in both alike.

I know it is common for us all to overlook such things as these in our relations with employees. We think that our part is done when we hand them the Saturday night pay check. But there are some things that money don't buy, because it cannot. We owe it to the men who serve us faithfully to let them know that we recognize and appreciate them for what they are as well as paying them for what they do. And as I look out from the windows of my observation the good and efficient yard man is of more importance to the yard now than ever before, for the yard and the office have become, in a sense, separated from each other. As no one can be in the two places at the same time, this has become one of the new conditions of the trade, especially in a place where the telephone is used. There may be an assistant in the office who can answer many of the telephone calls, such as orders for coal and other small matters, but the major portion of them deal with things that only the owner or manager is competent to attend and reply to, and, if he keeps his own books and does all of his office work himself, with none but the one man in the yard to do the other work he is practically obliged to be close to that telephone. He knows not the minute when it will ring up a call from some farmer in the country or party in town of a more or less important character, which requires an immediate answer, and business is such nowadays that it don't do to neglect even the possibility of getting an order from over the now common means of communication.

Before the Days of the Telephone

Before the advent of the telephone everybody who wanted anything from the yard or made inquiry about prices or anything else, was obliged to come in person or send some person for it, and it mattered not then whether the "boss" was in the office or in the yard waiting on customers, or at the car helping to unload it. He could do the business perhaps right there without leaving what he was doing. I have sold many a small bill, and figured it out on the end of a board sitting on the pile in the shade of the shed and loading it on the wagon and only went then to the office to make record of it either as an account or a cash sale. But those were the primitive times of hurry and rush in the retail lumber business, and our methods were at such times, as primitive and direct in their action. Every "boss" then knew just as well where every grade and every pile was in the yard, as does a good housekeeper that does her own work know where everything is in her pantry.

You and I, in those days, could go into the yard on the darkest night and put our hands on any pile of lumber or a size of door or window that was in stock. They were additionally familiar to some of us because we had put them there with our own hands. But, under the present conditions as I have described the average "boss" of a yard is more apt to ask his yardman where such and such a pile of stuff is located, not caring to trust his own knowledge of grades to find them. I don't know that I am very far from the truth when I say that there are some who know more about the office work and selling than they do of the grading of the lumber they sell. There is many a city lumberman who could not go out into the yard and fill a bill or a smaller order if he tried to, without calling on the yardman to help him, by showing him the proper grades and where the various items were in pile. This is not saying anything against his ability to successfully conduct the business of the whole yard.

The man who runs a city yard employing several men and teams and other office help besides himself has all he can do, without getting out and being among the lumber piles. He has got to see to the securing of enough trade to keep the other working factors of the yard going. Consequently he is obliged to leave the outside details of unloading, piling and delivering of orders in charge of a competent yard man who knows all about that part of the work. There are just so many teams doing the work of the yard and enough men to be loading them all at the same time if necessary.

Where the "Boss" Does the Work

In a good sized country town, however, where the farm trade constitutes the larger share of a yard's business, the "boss" himself has very often to get out into the yard and take hold in helping to wait on the customers, during the time of his busy season. For some peculiar reason or other the average farmer likes to have the "boss" wait on him in preference to any of the yard hands, and on a cold winter day, or a day in rainy weather, they seem to take a delight in seeing him get out in the cold or wade around in the mud to wait on them. They seem to resent it if he stays in the offce and sends someone else to serve them. They want everybody around them on the same level of conditions particularly if those conditions are disagreeable. You know what a farmer would think if he heard the "boss' asking the yard man where in the yard a certain pile or grade was. He would think that the yard man knew more about the business than the owner or manager did himself. It may be in some cases that this is the fact, but the young lumberman should be careful and not "give it away" in the presence of a farmer customer. If he does he will lose just so much of the farmer's respect for him as a business man. I have heard, in some instances, farmers saying something like this:

"If you want to know about where anything is in that yard, you've got to see Jack (the yard man) and he'll tell you. The old man don't know."

Where this is the case, it sometimes happens that the "Jack" of the yard gets to thinking that he does know more about the business than the "boss" himself, and is inclined to act accordingly as though he were the "whole cheese."

The country retailer, then, has to divide himself as it were, and be both yard man as well as office man as much as possible. If he can't go out into the yard with every customer, he should be careful to know that he has been waited on satisfactorily before he leaves. In order to do this he should be conversant with the details of the whole stock and its various kinds and grades, and where every one of them is piled. Every business, no matter what line, is made up of details, some have more than others, and the retail lumber business, in a country town, especially, is made up of a great many little things. Each one has its special relation to the other, and none may be neglected without in the same degree injuring the whole.

Now, I don't mean that the dealer should be simply a detail man and try to do things himself that his own time is too valuable to spend in doing, but he should be able to know and detect when they are not being rightly done by those he has given them in charge to do. It is not necessary for him to build up a pile of lumber, with his own hands in order that he may know just where the pile is. But he ought to so familiarize himself with every grade, kind of lumber and where it is piled in the yard that he can go out and load up a customer with anything he may want. It sometimes happens that the yardman has to be absent from the yard by reason of sickness or some other cause that may arise without warning, and unless the dealer has this knowledge I speak of, he is crippled this much in taking care of his business. As a matter of fact, it is often the case that the "boss" can go away and leave the yard for several days and the yard man can run it during that time without any particular difference being noticed in the care of the business. But let the yard man take a lay-off for that length of time, and his absence is quickly felt by him who is supposed to be running the yard, and unless he is posted on things in the shed and out in the yard, as well as his yard man, he is very apt to find himself in the midst of a good deal of worry and trouble for the time being, and when his man returns again to his post, he will have more of a realizing sense of his value and of his own corresponding ignorance of one of the essentials of his business.

Was Not Properly Equipped

Several years ago, I knew of a young man who bought out a yard with the money his father had left him when he died. His father had been a lumberman all his life, but he sent his boy to school and gave him a good school education, and no doubt, intended to take him in and teach him the business. But dying before he could do this, the son went and worked for a year in a yard owned by an old friend of his father, but instead of beginning out in the yard and learning the grades of the different kinds of lumber and how to handle and pile stock he was put into the office to learn the clerical part of the business only. Then he took a notion that he was fully qualified to run a yard of his own. He was fortunate enough to get with a yard he bought a yard man who was competent to run the whole business, as far as knowing all about it was concerned. The young and inexperienced owner soon found out his value and was compelled to defer to his judgment and rely on him for information concerning everything pertaining to matters relating to the stock and its arrangement. The young man sat in the office most of the time and had an assistant even to keep the books, and the yard man stayed out in the shed and practically ran the yard in caring for the stock and taking care of the customers. I never thought the yard made any money, but it was an occupation for the young man to put in his time and give him a standing in the community as one of its business men.

I have given this instance because I have reason to believe that there are other young men who have gone into the business on their parent's money, and imagined they could run a yard because they could keep books and "figger." Some, no doubt, have done this and found out in time, that no business can be learned in the office, and have gone to work and mastered its details out in the yard. But I know that there are others who have not. In several instances I have had line yard managers tell me that, judging from some of the things in the letters which they received from the headquarters office, they didn't believe that those who wrote them knew but every little about the practical business of running a yard. One day they would write something for the manager to do, and a few days later would send something else that was directly in conflict with their previous instructions.

Too Much "System"

A manager said to me once:

"I sometimes get a letter that looks to me as though one of the boy clerks in the office dictated it, because of the contradictory things which it enjoins me to do."

And further along in the conversation he said:

"It looks as though that if the owners of line yards were more fully acquainted with the local situation existing at every one of their yards they would use better judgment in the character of the instructions they sent out to their manager."

Some of these yards are so overloaded with "system" which has been inaugurated at the general office by some one fresh from the "Business Schools" that a good deal of the time of the manager is taken up with trying to follow out the winding of its involutions and obeying the long list of printed rules and instructions that are supposed to be part of the "system." It looks as though it is presupposed to supply the lack of brains and business ability in the manager and operates to make him a mere cog-wheel in the machinery of the whole. Of course, there has to be a certain amount of a generalized system in all these large concerns, but when there is too much of it in detail it operates to restrict the individual exercise of the manager's energies. It prevents him from doing his own thinking and exercising his tact and adaptability in treating with individual cases that the general manager nor his special agent, the traveling auditor, knows nothing about.

I was talking with the manager of a line yard concern some time ago, on the subject of meeting mail order competition or that of the other "pirates" in the selling of bills. He said he was hampered a good deal through not knowing the first cost of his stock. His invoices came from the house, and the cost of the separate items thereon were supposed to be his guide in figuring the cost when it was necessary. He knew though, however, that this did not represent the actual cost of the invoice as it came direct from the mills in the first place. As near as he could find out by comparing his invoices with the market price list, the house added about ten per cent. to the cost as it was rendered to him and therefore to this extent he was working under a handicap when he was trying to sell a bill in competition with parties who had a lower cost basis to figure from.

I am unable to say that this is a general practice with all line yard concerns. Probably it is only with the larger ones, and it may be necessary, no doubt, to charge each yard with a certain percentage on the original cost of all its invoices, to cover the cost of the maintenance of the headquarters offices and its force of assistants employed therein. This is one of the several reasons why an individual yard doing business alongside a line yard can do less business, and still make as much money as his big competitor. 'Tis true, when it comes to a "scrap" between the two, the big fellow can knock the little fellow out, but at a much greater loss than it is to him. I have thought sometimes, that this differential in cost that is charged up to the yards is responsible in many cases for the complaints of high prices from those sections that are dominated by the line yard concerns, and this perhaps is one of the principle causes of the organizing of so many farmers co-operative yards. The dealer who operates his own yard is in closer touch with the feeling and trend of opinion of the community where he lives and of which he is a part. He is enabled, therefore, to deal with a situation of dissatisfaction and allay it by responding with a lower price scale if necessary. It is always a poor policy to be stubborn and run counter to what is a well defined public sentiment. Nothing can stand against it when it has become thoroughly aroused and whatever the causes that exist for its hostility toward any business the wisest plan is to seek to remove them, and be honest in doing it.

Selling a Bill of Lumber

By M. Lingo

I was once told by a lumberman that was interested in the lumber business, both the mill end and retail end of it, that a retail lumber dealer was nothing more than a huckster, and as far as the retail lumber business was concerned and conducted, it was done on the same basis as the Dago pushing his banana cart and plying his trade.

This assertion was made by him after observing for some time around an office the way business was handled and the methods pursued to secure the sale of a lumber bill to a prospective customer, this, however, was uttered by him without meaning any offense to the retailer for he being one himself could not make this assertion with any ill intent, still he had his manager and was not the man behind the gun.

His interests fortunately to him were in small yards in small towns where business was conducted with small expense and without the extravagant methods one uses in larger places necessary to conduct business.

There is no doubt but that personality is a great asset to a retail lumber dealer and this asset many times makes a sale to a customer when a cheaper price has been offered by a competitor.

Still when one is presented with a bill of lumber to be figured on and where no relationship or acquaintance can be found to exist or time allowed to establish any personality, the question comes before us. How can I sell this bill?

At first one would say that prices is the only thing this prospective customer will consider, then after the retailer gets busy and does his best in the way of figuring in order to make a price that he thinks will secure the business, it is a 10 to 1 shot that he will be told his price is too high.

Then comes the chance to show one's salesmanship, the two get together, go over each item on the bill to see where changes can be made and short cuts can be taken to cheapen the bill. After all of this is footed up and deducted from the price given, the retailer then waits the decision of the purchaser, if then too high he makes an effort to ascertain what the other fellow's figures are, and, if anywhere near the figures made by him he cuts under this and feels if the other fellow can make this price, I guess I can.

We have no way of knowing that the price given us as the other fellow's figures are correct, and I have known cases where bills have been figured and the retailer was told by the prospective buyer that his prices were higher than others he had. However, for some flimsy excuse the purchaser told him he would give him the business. If the purchaser be a stranger the retailer thinks he has lied in regard to this and that he had the best price at first.

Substitution of Grades

Another matter is to be considered in regard to selling your bill is the matter of substitution of grades. We get the information from the salesman that so and so are buying his No. 2 dimension, No. 3 shiplap and lower grades of lumber from him and selling this stuff in bills that call for a better grade and furnishing bills that another retailer has figured on as filling as specified. Could one consider this legitimate competition or would one consider this salesmanship? It seems to me that this man is robbing his customer and taking an undue advantage of his competitor by securing business by unfair methods.

The excuse is so oftentimes made that these things are done in this manner because the other fellow does it, and in order to get his share of business he must do likewise. Instead of viewing this from a selling standpoint let us take a view of it from the buying end of it. How many retailers among us here have ever written a mill on receipt of a car from them and told them the stock shipped was a better grade than they had bought and wanted them to send them a debit for the difference in the grades.

When we begin to explain this to ourselves and say that we have not treated our trade exactly right in making this substitution of grades and similar methods, but have done it because the other fellow does it, we say this for no other reason for so doing, it eases our conscience not one bit. We may feel in a way our competitor is a rascal, but, if the truth be known, we are just as much of one as he is.

This is the vital question, we have no confidence in our competitor and he likewise has none in us. This existing feeling is so evident at all times that we never overlook it. The result is no friendly relation exists between those that should have the closest relation, our competitors.

Combinations and Agreements

The laws in some countries are such that combinations and agreements cannot exist and under this condition we are not allowed to bind ourselves to any sort of an agreement or have any existing combination wherein we must maintain a certain price or regulation. With this and the relationship existing that I have previously mentioned among all of us the condition is such that the watchword in reality is: Get the business, regardless of methods or margin of profits and in some cases take the bill and pocket the loss.

There is no restraint by any law or for any other reason why a friendly relationship should not exist among all men. Outside of our business dealings with our fellow lumbermen we encourage this in every way. Any man that has a business in a community and conducts it simply on a price basis for getting business, having no personality or friendly relationship with his fellow townsmen has a very poor asset, and in many instances where sales have been made of various enterprises a large bonus has been paid for the name and and trade established by the retiring concern. All of this goes to show that friendly relations with all men should be sought after by all.

I once heard a lumberman say: Take a lumberman away from his office and business, he was the finest fellow on earth—but when it came to business and the selling of a bill of lumber, you seemed to him and he to you to be the biggest rascal on earth." the rascal of course being the one that sold the bill.

Greatest Assets of Association

The greatest asset a retail lumbermen's association has to my mind, is the relationship it gives and brings to each of its members and friends that are in attendance at its annual meetings.

While mingling among our fellow lumbermen, we find the hand of good fellowship thrust out to us at every turn we make, let us all become so imbibed with this feeling of fellowship and friendliness to each other that we may carry it home and spread it among those that are engaged in the same business that we are. Instead of being in the huckster class, let us be merchants, being fair to ourselves and in doing this be fair to our competitors, and I am sure that all here will agree with me that this evidence will show up as a very valuable asset when we finish our inventories at the end of each year.

Educate Public in Fire Prevention

Most Practical Method of Saving Timber from Destruction—Address by B. C. Minister of Lands

An interesting address was recently delivered by Hon. W. R. Ross, Minister of Lands for the Province of British Columbia, at a public meeting held in North Vancouver, when he spoke forcibly of the necessity for educating the public to a proper measure of appreciation of their responsibilities in the matter of assisting to prevent the destruction of forests from fire. Hon. Mr. Ross dealt at first with the duties of the press of the country in this direction, saying:—

"There is one thing that our patriotic newspapermen never allow us to forget, and that is the tremendous commercial importance of our natural resources of this province. On the commercial side they keep us well informed, and make us realize fully the attraction that our resources are beginning to exert on outside capital, the possibilities of investment in forests, fisheries, mining and land, that exist in such profusion, and the rapid development that is taking place in lumbering and other industries. Our newspapers do all this and do it well—but if I have one criticism to offer it is that not nearly enough interest has been awakened in our natural resources regarded as public property—as an asset of the provincial treasury. I am thinking of the forests in particular; four-fifths of the timber in which belongs to the people of British Columbia. Every British Columbian in his capacity as a citizen is an owner of timber—standing timber, merchantable timber, timber that already pays one-third of his taxes, and every year provides the public treasury with two and a half million dollars for opening up the country, timber that provides one of the most remarkable public endowments that any nation has ever had. My criticism is that the average citizen knows next to nothing about all this; takes little interest in a great property in which he is a shareholder, and that the press do not do enough to arouse his interest

"Now if there are three achievements in forest policy upon which the present government prides itself they are these: Firstly, by favorable legislation the government helped to build up a flourishing lumbering industry; secondly, the government has refused to alienate the people's forests; thirdly, it has contrived to make the uncut forests yield revenue. The system of timber licenses under which all this was done was a really great and statesmanlike one. Under it our loggers and sawmill men were given the opportunity of securing a supply of standing timber without having to pay cash for it—payment being by small instalments year by year; an advantageous arrangement that gave a great lift to lumbering in this province. Shrewd investors who foresaw the future were attracted by the chance of securing an interest in standing timber before the coming shortage on this continent had made its price prohibitive. These men brought millions of outside capital into British Columbia—and once interested here, one business matter leading to another—they have helped in many a different way to build up the province. Look at Vancouver, and think how great a change has taken place there within the last few years and how much of that change has been caused directly or indirectly, by the busy prosperity of the lumbering industry.

Belong to the People

"Four-fifths of the provincial forests, as I have already said, belong to us—the people. A small proportion of this public timber is under 21-year leases, a considerable amount in reserve, and the bulk of it (say over 110 billion feet of some of the choicest timber in the world) remains unalienated, but under special license. In this licensed timber, the public and the licensees have gone into partnership—the public owns it, the licensees cut it, and together they share the profits. When profits are low, so are both their shares—when profits rise, the share of each party increases; the people of British Columbia, in other words have retained their hand upon the rise in value of standing timber, which is already becoming prominent as one of the inevitable results of modern civilization. Of course it is directly against the interest of the people to make demands that would hurt the prosperity of the lumbering industry.

"Well, here is your forest property, citizens, bringing you in two and a half millions of dollars a year already, and going to do much better than that in years to come. And these forests of yours are needed besides—for the prosperity of your agricultural sections, to steady your stream flow and give you irrigation, to improve your climate and to bring and support the population that makes your cities grow, and make your merchant prosperous. And what are you doing to protect your forests? What has anybody done in the past? The answer is just this—nothing was done in the past, and in spite of our efforts as a government, you, as citizens, are doing very little now.

Careless Campers

"We are now in June, gentlemen, and the annual burning up of British Columbia's forests and prosperity is about to begin. Careless campers will light fires in the brush, and leave them to spread and devastate stretches of our choicest timber. Conflagrations will be sown broadcast by defective locomotives, and logging engines, in spite of every effort of the government to detect, and punish the persons responsible. Tenderfeet ranchers will "take chances" and be virtuously astonished when the putting out of their fires costs thousands of dollars of public money. Quite a few lumbermen will look upon the spreading of fresh traps for fire as a necessary part of their daily business, and will have another summer's gambling with the god of fire—staking their plant and timber against many a lighted match and butt-end of a cigarette. Many an honest citizen will conceal what he knows about the cause of a bad forest fire, for fear of making an enemy of the man who started it, or in order 'to let the poor fellow down easy.' People will stand looking on at forest fires, wondering when the warden will arrive to fight them, or try to hold him up for fancy wages when he asks their help. By the end of the season, gentlemen, careless citizens of this province will have shot several million dollars' worth of our national resources out of existence, into smoke.

Rank Carelessness

"All this will happen, and the reason for it will be—carelessness—just rank carelessness. This is our great weakness as a people—we are careless about our great inheritance of timber and we tolerate each other's carelessness. Public opinion is all-important in the prevention of forest fire. Orators may thump the drum of eloquence; governments may strive to do their utmost—as the present government is doing—to save the forests, but in the long run success depends on a very commonplace matter—the amount of care the average citizen can be induced to exercise when using fire near the woods; care with matches and tobacco and cigarettes, care with camp and clearing fires, care with donkey engines and locomotives.

And while we are talking of carelessness, I want to ask my friends of the newspapers to be a little more careful in the news they print about forest fires. In the lands department we usually make allowances for the exaggeration that inveitably creeps into every account of a forest fire sent in by an excited local correspondent. But the continual publication of alarmist news items will surely give investors at a distance the idea that the whole country is burning up, and that standing timber is an especially unsafe investment in British Columbia, instead of being, as it is in fact, a great deal safer than elsewhere on this continent.

Methods for Protection

"And now I want to say something about what the government is doing to protect the forests. The government has had to face a very serious situation. The great increase, of which we are all proud, in the number of our settlers, in railway traffic, in lumbering operations, and in all the various kinds of work that take men near the woods, has caused a corresponding increase in the risk of forest fires. In British Columbia, moreover, the lumbermen and timber owners have not organized themselves into voluntary fire protective associations as the lumbermen of Washington and Idaho have so successfully. The provincial government has had to step in and shoulder the entire responsibility for fire protection, for the time being, and it has had to do this more or less in a hurry, to prevent as far as possible further damage to one of the greatest assets of the province. The government has had to employ a large force of men, and cover the timbered districts with a network of patrols and expend a very large sum of money both this year and last; and it has had to do this under great difficulties. I am glad to say that the difficulties caused by the overlapping of provincial and Dominion jurisdiction have to some extent been overcome. In the matter of the inspection of railway locomotives, and the clearing of the right-of-way, I have been able to come to an arrangement with the Dominion commission. Moreover, the railways have begun to realize the enormous destruction they have caused, and are now willing to co-operate with us in the prevention of fire. But we have other troubles in abundance. I will mention only one, it is this: there still lingers here and there in the province, a remnant of the old vicious belief that there is nothing morally wrong in attempting to make the government the victim of all kinds of extortion and petty fraud. Well, everyone will admit that the present government has done a great deal to raise the standard of public service. Both as a citizen like yourselves and as a minister, I see no reason, gentlemen, why a public department should not be expected to conduct its affairs with the same clear-cut efficiency as a private business corporation.

"Organize, organize, organize, here is the motto for public service. Study and plan and do aggressive work! and see that the expenditure of each dollar of public money produces the greatest amount of public benefit."

BERLIN MACHINE WORKS
HAMILTON CANADA

Berlin Machine

Hamilton

Original"
SIDE MOULDER

The No. 108 is not an inside moulder nor an outside moulder. It is a combination of the good features of both these types. From the inside moulder we have used the solid bed, the powerful feed works, and the rigid cylinders. From the outside moulder we have used those desirable features of accessibility.

The No. 108 is a heavy substantial machine built on a rigid one-piece frame which forms a very solid foundation for the working parts. There is no overhanging machinery, for the working parts are all built directly over the frame. This one feature goes a long way toward making it the most substantial moulder built.

The No. 108 has other features which you will appreciate. Glance at the picture and note the large powerful feed works, the rigid mounting of the cylinders and side head spindles, and the long adjustable wooden shoe which bears firmly on the stock all the way through the machine.

Then there are features of accessibility which can not all be seen in the picture but you will appreciate these when we tell you. The knives are easy to get at when you want to alter or sharpen them. All adjustments are made from the front side of the machine.

But, here is the point which is most significant in the value of the No. 108. It is the product obtained by expert designers who have been over the moulder proposition from A to Z and back again a great many times. In this moulder are contained the latest improvements known to modern wood working machinery construction.

To you these fine mechanical points are of little interest, but you who are daily using wood working tools appreciate most keenly how much profit there is to be obtained from a good moulder.

45 No. 108's sold and shipped last year. Why? Because one man bought, others learned what he was doing with it, and bought too.

If Berlin Tools are a "dollars and cents" proposition in his business why not in yours?

Before you decide on a moulder, we would like to explain the No. 108 to you. We are sure you will then appreciate what we mean by the term "Original Open Side Moulder."

Works, Limited,

- Canada

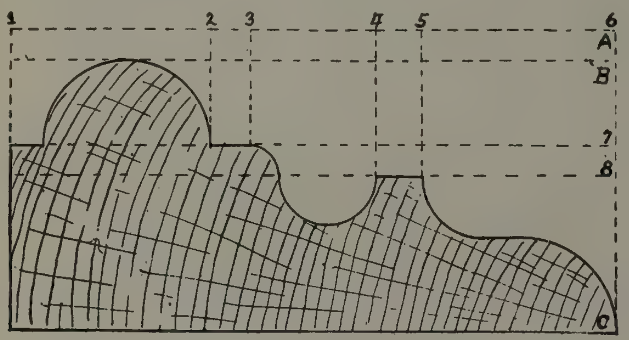
THE WOODWORKER

Setting Up Molding Knives

The purpose of this item is to describe a system of setting up for a molding for which you have no machine pattern. All shops in which any quantity of molding is turned out have their pattern racks carefully kept and pieces numbered, but others do not, and it is for the "others" that this item is intended. Take a smooth, thin strip a little wider than the moulding to be made. Lay off the pattern on the strip, spacing off each member of the mold at the intersections, as at 1, 2, 3, 4, 5 and 6. Line 1 shows the guide side; the half round knife for the top member should set a little past the line to cut cleanly. The knife to cut the member between 3 and 4 can be the balance for the knife to cut the member between 5 and 6.

Instead of using a block for the balance for the half-round knife, use something like a chamfer knife, square on the point and end, and make member between 4 and 5. A set of knives put on this way will turn out a mold with clear, well-defined lines and corners and look cleaner, having been cut smoother, even over knots, than with the old-fashioned way with solid cutters, no two of which are alike, with the possible exception of rare instances, where the planer man has more time to grind than falls to the lot of the average operator.

This simple system of setting up. if followed along these lines, will be of considerable help in the quick setting to new patterns.



In fact, any pattern becomes simple when laid off on these lines. Should the different members of the mold be of different heights, draw cross lines through the pattern, as at 7 and 8, and from them the projections can be obtained.—H. C. H. in The Woodworkers' Review.

Refined Lumber

One of the problems before the lumber trade to-day calling for solution is that of refining the low-grade lumber. This means nothing more nor less than cutting out and eliminating at the producing end knots and other defects in low-grade stock, so as to save paying freight on material that goes to waste at the factory. It means substantially a turning to the plan of cutting dimension stock for factory use in the woods. This is a matter that has been discussed frequently, but has not attracted the wide attention in the past which it is seemingly about to attract now. The freight item being an important one in the lumber industry, and the low-grade stock being something of a burden and bringing only a small price, a price frequently below the cost of logs, and the quantity of this stock increasing in proportion as the timber resources are cut out, these reasons are leading mill men to figure more seriously on ways and means for realizing more out of this low-grade.

Formerly when there was only a comparatively small percentage of it, because the timber was better, low-grade lumber found a ready market, at a low price, it is true, but it all helped out a little, so not much attention was paid to it. Now and then a furniture factory would conclude to go into the mill business and cut its stock to specific dimensions in the woods. Unfortunately, some of these ventures did not prove very successful, because too much was expected of the saw milling end, and there was too little specific knowledge of saw milling by the people undertaking it. Also, lumber values were lower and there was not the same inducement to go to extra trouble about it. Some furniture factories persisted in it, however, and others have from time to time arranged with mill men to cut certain regularly used stock into smaller dimensions in the woods, thus saving freight and furnishing better material, too, because it dries up better.

The whole subject, however, has taken on much importance during the last year or two, because of the higher percentage of low-grade lumber and the cost of shipping it long distances, working it up in the factory, and then getting only perhaps 50 per cent. of clear cuttings. It is easy to reason that there is lots of benefit to be derived from making this 50 per cent. of clear cuttings in the woods and throwing away the waste and thus saving freight on it. So there will be, to judge from the trend of sentiment as expressed in the lumber papers, more attention given to the working of specific small dimensions at the mills, in order to utilize low-grade lumber, in the next few years, and this should furnish opportunities both for machinery men and mill men to evolve machines and plan arrangements that will give the best results of this kind of work at the least cost for handling.

Flooring and the Low Grade

There is a revolution going on in the flooring business. In fact, it has been going on for some little time, says the St. Louis Lumberman. There has not been as much said about it. It seems to be founded on the desire for the elimination of unsightly cracks and the having of a respectable floor no matter what kind of material it is made of.

Strange as it may seem, this revolution is coming gradually from the consuming end and the attitude of the manufacturer is oft indifferent to say the least, whereas, if he but view the matter in the right light it is the manufacturer himself that should be enthusiastically pushing this revolution in flooring, which is for narrow strips. The reason why he should be pushing it is because right now in this new idea about flooring is the greatest chance going for cleaning up and utilizing low grade and getting for it a price that is worth while.

This applies both to hardwood mills and to pine mills. To all mills, in mact, making flooring. The hardwood mill men and those manufacturing oak have been realizing the importance of flooring as a means for cleaning up low grade for some time and as a result there have been many flooring machine additions to saw milling enterprises and there has been much development in oak flooring.

What is the result? It is this: that almost anywhere from Chicago, South on the east side of the Mississippi river a man can lay a floor of oak as cheap as he can one of pine. Especially since the late advance in pine lumber. This may not at first seem to signify anything of importance and there hasn't been much noise made about it so far, because carpenters as a rule do not like the idea of laying oak flooring in narrow strips. It is hard to nail, tedious, and they have to get down on their knees and use a nail set, whereas in times gone by they have taken a hatchet, hand ax, or adz, stood flat on their feet and pounded nails into pine flooring in almost any shape. But when the man that buys the floor comes to a full realization that he can get an oak floor at the same price for the material as a pine floor and that in this oak floor he has not only better appearance, but much better service there will be something doing. To be plain and frank about it a man is foolish to put down a pine floor in a house, that costs him as much for the material as it would cost to get the same thing in oak.

What this means when the awakening comes and the yellow pine men find themselves losing trade is that they, too, will cast about to see the why and wherefore of it and see what they can do to hold their trade. The only wonder is that they haven't been about it before. They have to a certain extent, but they have simply nibbled around the subject and have not gone into it thoroughly.

The whole thing in a nutshell is this: Oak flooring is made in narrow units from low grade stock. A popular width to-day is 1½ inch net face. Those who have used this width are seldom willing to go into the use of wider stock again. When oak flooring is made in this way, and end matched it is easy to drive up and in the thick stocks the joints may come anywhere, so that there is very little waste in laying and it makes a floor that one can be proud of.

The pine men that have taken note of the progress made in hardwood flooring and have made some effort to hold or regain their trade, have only come a part of the way, they have come down to 2½ inch and 2¼ inch face, something like the old widths in hardwood, but meantime this revolution in the flooring business is centering around the 1½ inch width.

In making this 2¼ and 2½ inch face the pine man is still using his regulation stock. Now here's what he might do and probably will do if this thing keeps on. He might take a lot of that low grade he complains of and by taking better care of it, properly kiln drying it, run it into pine flooring of 1½ inch face, end matched and find a better market for it than he is finding to-day for his wider stock. Then he would have his wider stock for boards and framing and have right at his hand a solution of the low grade problem that has been worrying the mill men for some time.

The one stumbling block seemingly in the way is the cost of running the flooring through the machines. The average mill man figures that it costs as much to run a narrow strip as a wide one, and it does, too, if he uses the same old cumbersome machines. It will probably call for a revision in the machinery line. And either for the use of light machines arranged in pairs or arranged for boys to feed or for high speed, narrow, heavy machines that will turn it through at an enormous rate.

The great feature about it to mill men is that in these narrow strips for flooring that are coming into favor rapidly now there is a chance by taking it up enthusiastically and adding end matchers and taking more pains with their work to not only get more out of their low grade lumber, but while doing it they will be able to keep the price of flooring down within reason.

As a sort of postscript a word of caution should be added here in regard to the use of low grade for flooring. It is not meant that low grade, which has been thrown out and become weather beaten and stained and half rotted will make good flooring. Neither can flooring be made out of the scrap pile that will give success without proper kiln drying. The right way to get more out of low grade lumber, no matter whether it is in flooring or anything else, is to take the same pains in handling, piling, and drying the low grade as is taken with the high grade.

Mission of the Stave Planer

The Inquisitive Man after looking through the modern tight barrel stave plant and taking note of the different machines used finally stopped beside the stave planer and fell to wondering a while. Then he began to ask questions of the barrel man.

"Why is it," he asked, "that you run the planer here to dress off tight barrel staves when you finish up your barrels on the lathe any way, and naturally should want all the surplus wood left on the staves for turning? Do you just smooth off the inside of the staves, or what?"

"No," the barrel man replied, "we don't touch the inside of the staves. There are some special barrels where they are turned inside as well as outside, but the majority of barrel staves are not touched on the inside. If they are for whiskey they are charred on the inside after the barrel is made up, and if they are for oil they are coated on the inside with glue, but the ordinary barrel is not dressed on the inside or turned on the inside after they are made up either."

The Inquisitive Man stopped and studied a while, but couldn't get it figured out to his satisfaction, so finally asked again, "Why is it you use this planer to dress the outside of the staves, when as soon as you make them into barrels you put them on a lathe and dress the entire barrel off?"

The barrel man laughed a little and said, "You have hit one of the things that we do, not because we want to do it, but because it is necessary to help out. The only thing in the world we dress these staves on the outside for at this planer is to clean off the outside and make clear the extent of the sap on the edge of the staves. In other words, it is for the sake of the jointer. Take a rough stave that has been piled in the air or even in the kiln, and the face is discolored enough that it is difficult to tell just where the sap on the edge ends and just where the heart wood begins. On some you can see it readily, but on others you can't tell anything about it. So the man at the jointer is at a loss. He just joints the staves to get a good edge and then, after these staves are set up, and made into a barrel and finished off, he will find that there is sap on the edge of one or two staves in the barrel.

"Do you mean to tell me that the man at this stave planer has to simply clean off the outside of the tight barrel staves so that the jointer can see where the sap ends and where to do his jointing?"

That't it exactly," the barrel man replied, "at least so far as we are concerned. I would really rather have every bit of the wood left in the stave until it reaches the lathe and would not give a man one cent a million to plane them for me in advance, if it were not that it cleans them and brightens them so we can see how to joint them better. The cooper shops making up barrels by hand may be better off from having the staves run through a planer and all dressed to the same thickness and the right curve, as it saves the cooper from doing a lot of hand shaving and dressing, as well as furnishes a bright face on which he can see the sap. But for us, where we use machinery in coopering, the planer isn't worth a cent except to clean off the face of the stock, yet we operate it steadily for that purpose. In fact, we can't figure out any way to get along without it. When we try even with bright staves we find it takes up more of the joiners' time in looking and examining the staves to see whether all the sap is off, and costs more in that way than it would to run the stuff through the planer so the line of sap can be seen clearly."—Woodworkers' Review.

Fire Protection for Woodworking Plants

Fire is the one great scourge of the woodworking industry. Practical suggestions for reducing the risk and the insurance rate on a mill are always welcomed by the owner and operators. One woodworking association has a committee on insurance which has prepared a card with printed instructions for proprietors, superintendents, foremen and watchmen. These cards are being distributed locally but deserve a larger circulation. The committee advises that a copy of all fire-prevention instructions given to superintendents, foremen and others be sent to neighboring plants and any local bureau having to deal with this branch of insurance. The printed instructions are as follows:

Clear Away All Refuse

All departments to be clear of refuse of all kinds.

Water barrels to be kept filled with water, and fire buckets put in their places. These barrels must not be covered at any time. Water to be changed when it becomes impure.

Sand-boxes to be kept filled and shovel handy at each box. Extra bucket filled with sand, ready for use, to be set on top of sand-box.

Make Regular Tests

See that all fire extinguishers are in their proper places and are in working order. The complete equipment of fire extinguishers should be tested once a year, one or more each month.

All fire hose to be taken out and tested twice a year, and if any repairs are necessary report to office.

All rags or refuse must be kept in standard metal waste cans, and these cans to be taken by elevator man to yard before the machinery stops, and must be removed from the premises the same day.

Use spittoons made of metal only, and never to contain any sawdust.

Gasoline, naphtha, or other volatile oil, should not be kept in building.

Gas brackets must have stiff fixtures. If it is necessary to use swinging brackets, all exposed woodwork must be protected with sheet metal, leaving an air space.

All waste must be hauled away from premises each day.

Each floor should be kept separate by fire doors to avoid drafts.

Have sheet-iron cupboards with doors and latches for the hanging of clothes for each man.

Electric Equipment

All electric wires must be drawn tight. See that the porcelain cleats are in perfect condition and insulation is in good shape on all wires. Where wires go through partitions or walls, wire should be reinforced by using fire-proof tubing or porcelain tubes. All electric wire joints must be brazed or soldered where connection is made. Lamp cords must not be hung on nails or wrapped around piping. Paper shades must not be used. Lamps must not be suspended by light twine.

Stairways must be kept clear at all times, and swept down once a week and refuse taken away.

Aisles and space around fire extinguishers must be clear at all times.

No stock allowed in front of windows to interfere with the firemen in case of fire.

Fire doors and shutters must be closed every night. Stock must not be in the way to hinder the ready closing of these fire doors.

Warn the Watchman

Instruct your watchman that if fire should occur prompt action must be taken, and impress upon him the importance of keeping cool.

Each foreman to inspect his department at quitting time each day and see that everything is left in good order.

Each foreman to go over these items carefully and see that these instructions are carried out, and report to the office or superintendent if anything is lacking.

Make an appointment with your night watchman once every thirty days for a 15-minute talk regarding the condition of the factory—he may offer some suggestions of benefit.

Inspection

Issue instructions to each foreman four times a year on the 1st of July, October, January and April, cautioning them to keep everything in order and see that all fire apparatus is in the best of condition. It will not take 15 minutes a day four times a year (total one hour) to dictate these instructions to the stenographer, and go a little further and issue, the first of every quarter, an order to your superintendent to go with you on an inspection trip to see for yourself that everything is in good shape. These few hours that you put in each year will not be noticed, but will be of great benefit and will be a good system.

CAMP DEPARTMENT

Some Shantymen's Grievances

Editor, Canada Lumberman:

The shantyman as a general rule is a happy and contented individual during his sojourn in camp but there are certain matters between him and his employers which he regards in the light of grievances, and these, rankling in his bosom, are often the source of a good deal of irritation. They are, in the main, little more than trifles, which might be easily put an end to by the lumber firms with little if any pecuniary loss; indeed it is doubtful if the employers would not find at the end of the season that with a thoroughly satisfied gang of men the output of logs would be greater than where a certain amount of dissatisfaction was rife. A man who finds that an employer is doing absolutely the square thing by him is likely to do a larger amount and better work than one who considers that he has reason for a "grouch." This may not be invariably the case, for there are some men no matter how considerately they might be treated who would shirk their work at every opportunity; but with the general body of men a little consideration on the part of an employer gives a greater incentive to the employees to do their best.

A satisfied camp goes a long way towards producing good results. If the cook is incompetent and the food is dirty or unpalatable, the men are soon in a state of dissatisfaction; there are threats to "jump the job;" and work in the bush goes on neither harmoniously nor successfully. The great improvement which has taken place in recent years in the cuisine of the shanty may be taken as an indication that lumber firms have come to realize that it pays them to feed their men well. Nowadays no foreman desirous of obtaining the best work from his men would think of retaining a cook who did not satisfy them. In the same way it would be both wise and profitable for lumber firms to try and remove any real or fancied grievances where they found it to exist.

Medical Attendance

One of the most fruitful and at the same time deep-rooted sources of irritation is the payment of the doctor's fee. The sum per man involved is not large, it is true, but the amount of bitterness it causes is greater than those who are not brought into daily touch with the men are apt to believe. It is the fact that they are being forced to pay for something which they claim is unnecessary and from which they say they derive no benefit that causes the trouble. There are two sides to the question—that of the master and that of the men, and, to provide a solution satisfactory to both parties is not an easy matter. It is a vexed problem not only in lumber shanties, but in contractors' camps as well. The employers not unjustly object to paying for the doctor's services is case of necessity; the men not unreasonably object to being compelled to contribute to the medical man when they never make use of his services. The provision of a camp doctor is in too many instances little more than a farce, for if a man becomes so seriously ill as to require constant medical attendance he is usually despatched to his home where he has to pay his own medical attendant. He has, therefore, some reason to complain, for when he requires the services of the doctor to whom he has been paying all through, he is sent away to where he has no chance of availing himself of them. For any ordinary ailment which makes a man feel out of sorts and unfit for work for a day or two the camp doctor is practically useless; he can do little more than provide the standard remedies which the men either possess themselves or can procure from the shanty office. Unless it is a case of extreme urgency the average camp doctor is unlikely to make a special visit to camp. Of course in the case of a serious accident it is a great advantage to have a medical man to call upon, but serious accidents are rare, and altogether the men do not receive any real benefit from their contributions.

However, the fact remains that a doctor has to be provided for the camps and someone has to pay the piper. As has already been pointed out it is not the fact of parting with a few dollars each season which irritates the men; but the feeling that they are contributing to something which does not benefit them. "I wouldn't mind paying for bringing in the mail the amount we pay for the doctor. It is paying for something from which we get no return" is in effect the view of the average shantyman in regard to the matter. The only way out of the difficulty seems to be to devise some scheme to insure the men against sickness. By a small addition to the men's monthly contributions the employers should be able to arrange that when a man is taken ill, and has to be treated away from camp, he can obtain care and attention in the nearest hospital, or at all events free medical attendance wherever he may be located. If they were assured of some real advantage accruing in the case of sickness I do not thing the shantymen would begrudge the doctor's fee, or even a small addition to the present amount.

Penalizing an Employee Who Leaves Camp

Another prolific source of discontent is a practice which prevails in regard to men whose fares have been paid from the place of hiring to the railway point nearest camp. If such a man leaves his job before break of camp he is usually charged double fare "to provide another man to take his place." I have heard complaints long and loud emanate from men not affected by this system, but who resent the penalty being enforced upon their associates. It creates an impression that the firm is trying to grind the men down and to lead them to believe that they are not free agents to leave their employment without having some sort of a fine arbitrarily imposed upon them. As the matter stands at present the arrangement is rather in favor of the employer for if a man is sent to a distant point and is discharged for any reason he has to pay his own fare back, or if he has not earned enough to do so he has to get home as best he can. Where the firm has originally paid a man's fare to camp it is only fair and reasonable that they should deduct it if he "jumps" before the break of camp, but the imposition of the double fare is regarded by the shantyman as unjust. If he "jumps" it is pretty certain that, rightly or wrongly, he is dissatisfied, and a dissatisfied man is better away, for his discontent is likely to spread to others in the gang. Moreover, the firm would be nothing out of pocket if they were content to accept the refund of the one fare. They might enforce the double fare in extreme cases, where a large number of men showed a disposition to leave, or where a man had been guilty of some flagrant misbehaviour. There seems no particular obstacle in the way of both employers and employed being compelled to give a definite notice to quit—say a week or two weeks; then if a man left at short notice he would have a week or two's wages forfeited, or if summarily dismissed he could claim wages in lieu of notice. Under such a system the owners of the limit would be ensured against having their camps disorganized by their workmen leaving them in the lurch and causing them trouble and annoyance whilst on the other hand the men could not claim that the arrangement was one-sided.

Although but a minor grievance the excessive charges made in some camps for goods supplied from the "van" is often the source of a good deal of grumbling. The profits from the lumber business ought to be sufficiently large to enable goods to be retailed in camp at about the same price as that at which they are sold at the average country store. Where the men are charged more than ten cents for a plug of tobacco they complain, and in the case of a heavy smoker the excess tells up in the course of six months.

The obstacles which are often put in the way of men desirous of leaving camp for the Christmas holidays, where their homes are comparatively easy of access, often leads to unnecessary unpleasantness. After all it is only natural for men after three or four months solitude in the bush to wish to join their families around the festive board at such a season. Usually if a foreman consents to some of the men taking two or three days off he does it with a bad grace. The probabilities are that if the men met with a point-blank refusal they would give up their jobs and go anyway; so that if a foreman intends to give his consent he might do it without any show of bitterness. The absence of a number of men from camp at Christmas time upsets the work and routine of the shanty considerably, it must be admitted, and some fiancial loss is also entailed but the lumber firms fare no worse than factories and other large establishments which cheerfully shut down at that joyous season.

The foregoing remarks pretty accurately voice the views of many shantymen through one who has been brought into close association with them. If lumber firms could see their way to do away with these little grievances they would not only give must satisfaction, but would give the men greater zeal in their work.—Lumber Clerk.

The Hoo-Hoo lake cruise in September on the City of Cleveland will be the most delightful outing for lumbermen and their families and friends ever planned. The City of Cleveland will sail from Detroit about 11 a.m., Saturday, September 9th, for a five-days cruise through Georgian Bay to the famous government locks at Sault Ste. Marie, returning to Detroit Thursday forenoon, September 14th. The fare is $32.50, children half price. This includes all meals. For itinerary and programme of trip, diagrams for stateroom reservation, and list of those enrolled for the cruise, address Concatenated Order of Hoo-Hoo, Nashville, Tenn.

Temiskaming Country Needs a Mill

At a recent banquet given to the members of the Toronto Board of Trade at Haileybury, Ontario, Mr. George Rochester, one of the best posted men upon the lumber business in the Temiskaming district, gave an interesting speech in which he discussed the advantages which would result if a large sawmill could be erected at Lake Temiskaming. During the last fifteen years, he said, the important manufacturers of Ottawa had spent a million dollars a year in their operations on the country around Lake Temiskaming alone. Every log that the companies cut went to Ottawa, to Pembroke, Arnprior or Braeside mills, the large majority going to Ottawa. This season there has been taken out of the Temiskaming two and a half million logs by J. R. Booth, Gillies Bros., and other lumbermen who own limits of 10,000 squart miles tributary to Lake Temiskaming. A large mill would represent an investment of many thousands of dollars, and although it cost $2 a thousand to drive the logs to Ottawa and a loss of ten per cent. during the two years they were on the way, it did not seem probable that any of the established producers would put a mill on Lake Temiskaming so long as two-thirds of their cut was located lower down.

There were sixty-five mills in Northern Ontario, but none of them were making progress commensurate with the growth of the lumber. The little man had no chance whatever to compete for export trade. He had to confine himself purely to local business. Only the big man could carry on big operations. To make a profit, a mill with a capacity of twenty-five to fifty million feet a year would have to be erected and extensive limits would have to be bought, the price of which was now about $1,000 a mile. On the present schedule of freight rates it would cost $3.60 per thousand to take lumber to the consumer. Against this however one could balance the advantage of being able to get one's money back without the delay of two years which was necessary when the logs were floated all the way down the Ottawa River. It would be a long time before the local demand, although it had grown very rapidly, would be sufficient to justify a large outlay of material in the erection of a mill. On the face of it, however, the enormous waste would be saved and a good profit made by manufacturing the lumber on the spot in the Temiskaming country. The question was where would they find a millionaire to undertake the work.

Qualifications of a Yard Foreman

I had the opportunity some time ago, in the course of my rounds, to study a plant which operated six departments and a yard. This was conducted by a man who was purely and simply a millman, reputed to be a good one, too, who understood the manufacturing end of the business, but lacked technical knowledge of the lumber business. This, in time, led to a deplorable condition of affairs which soon became aggravated, says a writer in the Pioneer Western Lumberman.

Early in the administration of this individual, his faulty knowledge became apparent to the men under him. The rank and file received certain of his orders at first with amusement which later changed to sheer amazement, that the company could employ a man with so little actual technical understanding of the business he controlled.

Through his ignorance, the finer grades of lumber were improperly worked up when poorer grades were only required for the purpose at hand. This necessarily worked a loss for the owners. One day, a worker brought the attention of the latter to the incompetency of their manager by refusing to work up lumber which was thicker than required and cost $12 more than the stock required for the work. To work up the thicker lumber would have increased the cost of the finished product over 55 per cent. For refusing to do as the manager required, the employee lost his job while the manager continued his wasting policy.

This resulted in the other employees keeping their hands off and any old kind of stock was used in the working up of orders. No attention was paid to the obtaining of the best results for the owner. Everybody's business became nobody's business. Bickerings became rife in the yard and plant. There was no effort made to avoid or rectify errors and the general manager became a heavy expense to the owners of the mill and yard. The loss to the latter increased each day and the annual balance was a sight to see.

No plant run in this manner can succeed. Co-operation between men and foremen must exist at all times. Heads of departments must work together for the good of the employing company or else nothing but loss will accrue.

Employees are quick to see incompetence, while owners are often led astray in their judgment of their general or department managers through personal bias or rank favoritism. The latter condition is certain to spell ruin, and, to-day, the plant from which the above instance is drawn is losing money hand over fist, where its competitors are making a profit. Yet blindness of the men most interested in the condition of the ledger sheets is responsible for this condition of affairs in the yard and mill.

How to overcome the situation is indeed a problem. The writer's experience—and he saw this condition of which he writes—would be to have numerous conferences between employers, managers and men. Let all concerned speak the truth. Let the owners encourage frankness in criticism and protect the workingmen from the resultant ill-feeling of the bosses. Take an hour every week for such conferences as these and the ledger will show profit in every instance where loss alone shows to-day.

Another way would be to have a complaint letter box wherein men could drop their suggestions which would or should only reach the eyes of their employers. These letters should be signed, but should be considered as most confidential. Resultant action would then rest upon the managerial ability of the employers. It could do no harm to start such a system as a trial anyway and my suggestion, coming as it does from a practical mill and yard man, will be found to save many a penny now thrown into the sewer.

The proceedings of the ninth annual meeting of the National Lumber Manufacturers' Association which was recently held at Chicago, have been published in book form and issued to the members of the association. Others desirous of obtaining this excellent publication may do so at the price of one dollar, by addressing Mr. Leonard Bronson, Manager of the Association, at the Fidelity Trust Building, Tacoma, Washington. The publication has been splendidly produced and the many interesting addresses which were delivered at the meeting will prove of the utmost value to the lumber trade and industry.

Machinery and Equipment

Opening of the New Simonds Plant

The new plant of the Simonds Manufacturing Company at Lockport, N. Y., which has now commenced operations was thrown open to the public for inspection recently. The plant consists of seven storeys in which there were some 250 employees at work when operations commenced, this has now been increased to about 300. The annual pay-roll of this extensive plant amounts to about $196,000. The opening of the plant to the public was taken advantage of by over 1500 people, all of whom were greatly surprised by the magnitude of the enterprise.

One of the features of the opening event was the pouring of the celebrated Simonds steel, at which about 115 members of the Town Council and Board of Trade were present, together with a number of representatives of the Bench and Bar and of the daily press. All the other interesting processes of the plant were shown to the visitors and in addition to being of the utmost interest to all the events were of great educational value. The seven buildings constituting the plant cover three acres of ground and contain 100,000 square feet of floor space.

A New Industry for Canada

The Canadian Mathews Gravity Carrier Company, manufacturers of gravity freight carriers, conveyors and automatic elevators, have established a factory and office at 28 Sheppard street, Toronto. This is a Canadian branch of the American company, with headquarters at St. Paul, Minn. Mr. O. C. Sylvester, of the home office, is in charge of the Canadian end. This company specialize in conveyors for lumber concerns, both portable and stationary, and their patents show great improvement over the ordinary conveyor now in use in the saw mills throughout the country.

Good Business Everywhere

Mr. Madison Williams of the well-known Madison Williams Manufacturing Company Limited, Lindsay, Ont., recently returned from a business trip to the Pacific Coast. Mr. Williams reports business right through the Western provinces as being exceptionally good, and speaks of the wonderful development now taking place in British Columbia as simply phenomenal.

Increasing Demand for Mechanical Rubber Goods

The Goodyear Tire & Rubber Goods Company, Limited, are making a big addition to their Canadian factory at Bowmanville, Ont. When completed the factory will have double its present capacity. This enlargement has been made necessary because of the greatly increasing demand for their mechanical rubber goods which the Goodyear people are meeting with in Canada.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

Axles Wanted

Wanted to buy wagon axles. Jackson Wagon Company, Limited, St. George, Ontario. 12-13

White Pine to Order

Wanted to correspond with parties able to cut White Pine to order. H. V. Berry, Fort Plain, N. Y. 12-13

Slabs and Edgings Wanted

Will buy in any quantity, wood slabs and edgings. Fizette, 265 Davenport Road, Toronto, Ontario. 14-14

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Tank Lumber Wanted

We require 2-in. and 3-in. Tank White Pine, 6-in., 7-in., 8-in. and 10-in.; 10 ft. to 24 ft. Also red pine. Highest prices for Pump Squares. Ontario Wind Engine & Pump Co., Ltd., Toronto, Ont. 7-tf.

FOR SALE—LUMBER, ETC.

For Sale

100 cars Longford Hemlock, assorted sizes.
100 cars Whitney Spruce, any width.
25 cars Ravensworth Birch, 1 in. and thicker.

Apply to Quincy Adams Lumber Company, Limited, Longford Mills, Ontario. 14-17

For Sale

300,000 feet 1 inch Birch.
250,000 feet 1¼ in. to 3 in. Birch.
1st and 2nd and No. 1 Common from three to six months on stick.

ROBERT STEWART, LIMITED,
13-16 Guelph, Ont.

For Sale

One car good crating Elm.
One car Hardwood Flooring, Kiln Dried.
Two cars Birch Plank wide 3 in. and 4 in. Bored Hearts.
One car Birch and Maple, 5 in x 6 in. Boxed Hearts.
Fifty M. feet 2 x 4 in., 6, 8, 10, 12, 10 to 12 feet long.
One car 1¼ in., 1½ in. wide white Pine.
Low price for quick shipment.

THE HALL BROS.,
301 Church St., Toronto
13-14 and Marmora, Ont,

For Sale

Product of two million feet of good white pine logs, rail or water shipment from Bruce Mines. Apply Bruce Mines Saw Mill Company, Limited, Bruce Mines, Ont. 11-14

For Sale

4 cars 1-in. Ash, No. 1 C. and B.
2 cars 1¼-in. Ash, No. 1. C. and B.
6 cars 1½-in. Ash, No. 1. C. and B.
4 cars 2-in. Ash, No. 1. C. and B.
6,000 Cedar Telegraph Poles, 30 to 50 ft.

GEO. C. GOODFELLOW, Montreal.

For Sale
Hardwood and Hemlock

If you want to buy Hardwood or Hemlock or Ties, Posts and Shingles, visit limits and make an early contract. Pay as work progresses. Can get you 5 or 10 million feet of each on Georgian Bay. Box 266, Canada Lumberman. 9-16

Lumber for Sale

One car hard Maple and Beech, clean dry stock, cut 1½ and 2 in. squares in lengths of 20 in. to 4 feet, also a quantity of
1 x 2 x 26 in. Beech and Maple, clear.
1 x 2⅛ x 28 in. Beech and Maple, clear.
1 x 2 x 36 in. White Basswood.
2 x 2 x 18 in., 24 in., 28 in., long oak squares.

For further particulars write or see
P. D. CAMPBELL,
13-16 Newbury, Ont.

FOR SALE—MACHINERY, ETC.

FOR SALE

Small Band Sawmill, Waterous make, complete with filing room tools, and Gang Edger, Live Rolls, Slab Slasher, Shingle Machinery, Shafting Gearing, Etc., also, Dynamo and Motor. Also a large number of factory Machines, comprising Matchers, Moulder, Band Rip Saw, Variety Saw, End Matcher, Shafting, Belting, Shaving Exhauster and Pipes, Dry Kiln with Steel Cars, Engine and Boiler, Etc.
2-tf. JOHN FINDLAY, Owen Sound.

Machinery for Sale

Carver, 4 spindle Rohlman.
Two cut-off saws, railway, wood frame.
Dovetailer, Boults.
Floorer, 9-in. Berlin.
Planers, 24-in. single belted.
Jointer, chair seat, Jenkins.
Moulder, 6-inch, Houston.
Mortiser, hollow chisel, Greenlee.
Mortiser, Smith.
Mortiser, bit.
Saw and Dado machine, Williamsport.
Sander, double 24-inch, Perry.
Sander, 42-inch three drum Boardman.
Sander, 41-inch three drum Columbia.
Saw gummer, Rogers.
Saw-mill, band 63 inch wheel.
Engines and boilers, various sizes.

O. L. PACKARD MACHINERY CO.,
Milwaukee, Wis.

New and Second Hand Machinery For Sale

AT HUNTSVILLE

One Northy (secondhand) "Duplex" Steam Pump, 3½ x 2½ x 4.

One secondhand Circular Saw Grinder "Colville Patent," good as new, built by The Wm. Hamilton Company, Peterboro.

One secondhand Upright Boiler, engine attached, 20 h.p. Boiler tested to 160 lbs. C. W. pressure.

One Steam Oil Separator, 8-in. pipe. McEachren make.

One Iron Saw Frame and Mandrel complete with pulleys and third bearing. Steel Mandrel, 3 7-16 diam. Waterous make.

One Dry Kiln in four bands of pipe. Steel jacketed with 5 ft. Fan Shaft. Bearings and Pulley. Back pressure valve and steam trap. Over 4,500 ft. lin. piping in the four banks in addition to bases.

One new three saw Edger. Steel Mandrel 2 7-16, with three bearings open end, for 16-in. saws, including Table Rollers and Shifter Irons.

THE HUNTSVILLE SYNDICATE,
11-14 Huntsville, Ont.

Lath Mill and Bolter

For sale, combined lath mill and bolter, made by G. Walter Green, Peterboro. Price new, $200; only used a few days, mill out of business. Half price will buy it. F.O.B. Cars at Kinmount. Apply to J. R. Mark, Kinmount, Ont. 12-15

WANTED—MACHINERY, ETC.

WANTED—to purchase, one second-hand saw-mill, in good repair; complete with gang edger, and equipped with suitable power plant; also shingle mill. Address, Box 291, Canada Lumberman, Toronto, Ont. 14-14

Matcher Wanted

Second-hand, in good condition. Describe. Name, maker and lowest price. York & Sunbury Milling Company Limited, Gibson, N.B. 14-15

WANTED—EMPLOYEES

Advertisements under this Heading two cents a word per insertion. Minimum charge 50 cents

WANTED—First class Circular Sawyer, accustomed to steam feed, steam niggers and loaders, for right or left hand saw. Good wages for a good man. Reply to Box 295, Canada Lumberman, Toronto, Ont. 14-14

WANTED—A competent Pine Lumber Inspector, accustomed to grading for the Ontario market. Apply, stating salary expected and giving references, to the Sheppard Lumber Company, Limited, Waubaushene, Ont. 14-17

WANTED—Good man with Portable Saw Mill to cut out one million feet. Commence September 1st. Can give several years contract. Money advanced as work progresses. Apply Box 275, Canada Lumberman, Toronto, Ont. 11-14

WANTED—EMPLOYMENT

Advetisements unde this heading one cent a word per insertion. Box No. ten cents extra. Minimum charge 25 cents

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

BUSINESS OPPORTUNITIES

Man with shingle mill and timber wants competent partner with small capital. Box 70, Thessalon, Ont. 11-14

Partner Wanted

Thoroughly posted in buying lumber by a good salesman of No. 1 standing. Address, Box 296 Canada Lumberman, Toronto, Ont. 14-14

For Sale

Planing Mill, Lumber and Coal Yard, in Western Ontario, doing good business; good reason for selling. Box 292, Canada Lumberman, Toronto, Ont. 14-17

For Sale

Planing mill, in a small town in Algoma in the heart of the lumber district and forty miles from Sault Ste. Marie. Apply Box 294, Canada Lumberman, Toronto, Ont. 14-15

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

In Alberta, Timber Limit and Mill, capacity 10 m. per day. Large amount of dry Fence Posts, Mine Timbers, and Cordwood. Railway through property; private loading facilities; good proposition; cheap. Inspection invited. For particulars apply to Box 293, Canada Lumberman, Toronto, Ont. 14-14

Timber and Land Investment

Farm of three hundred acres within 35 miles of Toronto—one hundred acres of which is timber land—Pine, red and white Oak, Maple, Beech, Basswood, etc. Balance of farm is under cultivation, thirteen acres bearing apple orchard. Buildings cost over five thousand. Price, $29,000. Box 160, Canada Lumberman, Toronto, Ont. t.f.

Here is a Snap

Saw Mill and Timber Limit for sale, on Grand Trunk Railway. Easy to lumber limit, contains four to five million feet mixed timber, besides a large quantity of standing and lying dry pine; two million feet free from Crown dues. Mill now running, equipped with trimmers, double edges, slash saws, lath and shingle mill. Price 8,000. It won't cost much to come and see this outfit; it is a bargain. Write Box 37, Barry's Bay. 14-17

MISCELLANEOUS

For Sale

About 35 acres of standing timber, principally cedar poles. Apply S. A. Price, Burhamthorpe, Ont. 14-15

I HAVE FOR SALE ON THE PACIFIC COAST

In Tulare County, California. A choice compact tract of 275,000,000 feet of redwood and 125,000,000 feet of sugar pine, nicely located to operate and can be marketed in Los Angeles, California. I want a buyer in the next six weeks. Can be bought at a bargain.

L. VAN WINKLE,
14-17 Santa Monica, Cal.

Grooving Pulley Rims

"J. J." writes in the Timber Trades Journal: "I notice some engineers both in this country and America have taken up the practice of grooving the pulley rims on saw benches, planing machines, etc. The object of this is, I suppose, to prevent air cushioning and to get rid of the air which is supposed to lodge between the belt and the face of the pulley, and prevents their close contact. One would imagine that if the face of the pulley is true, and the face of the belt soft, smooth and pliable, very little air could collect between the belt and the pulley face. If any of your readers have tried these pulleys I should be glad if they would say if they consider them an improvement as regards driving power over ordinary ones. One would imagine also that grooves on the face of the pulley would have a tendency to increase the wear on the driving belt. I remember years ago—with the same object—holes were bored right through the pulley rims, but I do not see any of these about now."

Extra Thin Gauge Circular Saws

Extra thin guage saws are apt to spring aside and follow the grain of the wood, and to run them successfully a number of points must be borne in mind, says the Timber Trade Journal. In the first place, the bench itself must be well constructed, the saw spindle, bearings, collars and pin be kept dead true, and the bearings be of ample area and well lubricated. The saw must be carefully tensioned to suit the rim and feed speed at which it is to run, and be correct for the work and timber in the shape and number of teeth, gullet room, and be uniform in space and set. Bearing in mind that the thinner the gauge of the saw the greater the number of teeth required to stand a given feed, care must be taken that the teeth are uniformly sharpened and the saw is in balance, i.e., is absolutely round. The packing, too, should be very carefully adjusted so as to give a uniform heat over the whole blade. The speed of the saw should always be kept up to its full standard, and be as regular as possible.

A Belt Shifting Wrinkle

The ordinary belt shifting gear used in a saw mill usually consists of two upright iron rods fixed on a cross-bar operated by a lever. If this arrangements is in constant use the edges of the belt often become twisted and damaged and its driving power reduced owing to the dead pressure of the belt forks at a limited point, says the Timber Trades Journal.

Instead of using two iron belt forks much less damage is done to the belt if two pieces of wood, say 12 in. long by 6 in. deep, are fastened to the cross-bar, as when the belt is shifted the uressure is distributed over 12 in. of its edge instead of being concentrated to one spot, as is the case with stationary vertical rods. Another plan is to make the belt forks of hollow porcelain rollers, and allow them to revolve when the belt is shifted, which will reduce the friction considerably. This may appear a simple matter to that count in these days.

Making Joints on Steam Boilers

A considerable number of accidents arise in steam boilers through the manhole and mudhole joints being badly made after the boiler has been cleared out. In the first place, care should be taken that the metal faces of the joints are mare dead true, and this packing should never be used to fill up any irregularities, as a thin true joint will stand better than a thick one. A good material for joints up to, say, 100 lbs. pressure is asbestos board, with thin wire gauze interwoven in it. The different forms of indiarubber become hardened, and are unreliable.

A good plan is to cut thin asbestos rings to the exact sizes of the joit faces, and coat them with blacklead, as they can be readily removed and used several times over. In making the joints of mudhole covers, which are fixed from the inside of the boiler, cast lead rings, about ⅛ in. thick, make a good joint, and are largely used. In many of the best boilers the joint facts are now usually machined to a true surface.

Review of Current Trade Conditions

Ontario

The lumber trade in Ontario is in a fairly satisfactory condition. Wholesale travellers report that most of the retailers are buying from hand to mouth. As none of their stocks are over large, this policy results in a fairly good volume of trade to meet the extensive requirements of the building trade at this time of year. The competition among sellers of lumber at present is unusually keen. Retailers take advantage of this fact to wait until they can obtain the very best offer. Having then delayed a little longer than they should, in many cases they want delivery almost the very next day. The wholesalers believe that they have a decided grievance on this score. There is no question that with the present shortage of cars for shipment and the scarcity of laborers at shipping points, it is next to an impossibility to make expeditious deliveries. Retailers would assist considerably if they could get over the habit of delaying their orders until the very last moment and then asking for immediate delivery.

The low end of the stocks on the Georgian Bay are being cleaned up satisfactorily. In fact this applies also to all grades at Georgian Bay points. Lath are fairly well picked up. Shingles are unchanged at $3.30 for B. C. cedars. B. C. Fir has not been selling quite as well of late as formerly. The demand has declined a little and the price has been reduced to correspond.

The lumber business of Ottawa has been very quiet during the past few weeks. The local trade is about the only active feature of the whole business. Some relief has been given in the car shortage and shippers are now able to move a fair quantity of their lumber. A change is coming over Ottawa trade in regard to shipments, many of the mills show a growing preference for rail shipments instead of barge shipments. The shipments of lumber by barge to-day is only about one-half what it was ten years ago.

Eastern Canada

The lumber business at Montreal is in good condition, with steady prices and active trade. The prospects for a continuation of the good building business are excellent, as there are no building strikes at present. Lath continue strong and scarce. Spruce and pine are in good demand for the higher grades. There are indications of improvement in the demand from the United States. A continuation of the shortage of cars for shipment of lumber into Montreal is reported and the situation is so serious that dealers are considering the advisability of bringing the matter to the attention of the Board of Railway Commissioners.

Manufacturers are predicting a higher price for eastern spruce, at Boston, on account of the logs not coming forward freely. Prices asked for frames at present are about $23.50. Some manufacturers, however, who have orders on hand, are asking $24. A slight improvement is noted in the market for random. Spruce covering boards are in moderate demand. Hemlock at Boston continues quiet. Manufacturers are holding firmly at $19 to $19.50. Shingles are easier and quotations for extras range from $3.40 to $3.50, with very little business at the top price. Lath at Boston are inactive. For 1⅝ inch the price ranges from $3.65 to $3.75 and for 1½ inch from $3.40 to $3.50. At New York prices for eastern spruce are firm, as a result of limited offerings on the part of the mills. Lath are well held, and cargo shipments to arrive are easily taken care of.

Great Britain

The London Spot market has been experiencing rather a broken period of business. Arrivals of stock have been fairly extensive, but the actual trade in progress has not been encouraging. The market lacks animation. The building trade is quite lethargic, and shows no indication of improving. The demand for wood paving continues good. Arrivals of floorings have been scarcer of late.

At Liverpool there has been no marked improvement in the whitewood branch of the trade. Holidays and the Coronation interferred considerably with trade and it will take some time to overcome the influence of the latter. The spruce deal market is unchanged, so far as spot prices are concerned. Future conditions are very difficult to foretell. A shortage of supply is already expected, as a result of the large quantity of spruce logs which are reported to have been hung up in New Brunswick and Nova Scotia. Canadian pine deals are unchanged and are going into consumption direct from the quay contracts made to arrive. Pitch pine contracts "to arrive" are scarce.

At Manchester the trade has been upset considerably by the Coronation. The building trade is very quiet. Trade, however, has been on a slightly increased line and stocks have been reduced about as low as is possible. A busy import season is expected. The uncertainty which always prevails in connection with the spruce market is quite noticeable. At Bristol the trade so far this year has not come up to expectations. The revival in the building trade which was expected has not occurred. The market for redwood and floorings is rather uncertain, and a great deal depends upon the nature of business during July.

The Glasgow market remains unchanged. If anything the last few weeks have seen a quieter trade than formerly, and it is believed that there will not be any improvement during the rest of the summer. The half year's trade has been more or less disappointing to all concerned. The shipbuilding trade is quite busy, and will probably continue to consume large quantities of lumber. A steady improvement is expected also in the box making industry. House building and general joinery are quiet and an improvement is looked for in the furniture trade. Stocks of lumber all round are light, at Glasgow, and with a reasonable demand prices ought to advance.

The American consul at Liverpool, England, writes that white oak and black walnut are in fair demand generally in Liverpool, but that cherry lumber has not been imported to any extent for many years. The common way of receiving white oak is in plank 3x12, 3½x12, 5x12, 5½x12, 6x12, and 7x12 in lengths of 12 feet up to 17 feet. These sizes are used for railway and general wagon building, and the present market value for first class stock is from $.52 to $.56 per cubic foot. White oak is also shipped largely in 1-inch boards, 4 inches and up wide in lengths of 10 feet and up, which sizes at present are worth from $.48 to $.52 per cubic foot. Quartered oak brings from $.60 to $1.33. Black walnut is imported both as logs and lumber to comply with requirements. Logs should run ten feet up and be of fair average length and 18 inches in diameter. Values range from $.73 to $1.46 per cubic foot. Walnut lumber is shipped in various grades from 1-inch boards up to 3-inch planks. It has a great variety of grades ranging in value from $.54 to $1.58 per cubic foot. The bulk of the business in both lines has been on consignments. The customary brokerage commission is four per cent.

United States

Chicago:—Increased enquiries from the country are reported both by wholesalers and retailers and the trade is commencing to expect an excellent fall business. The city trade also is improving steadily and building activity is increasing. Northern pine business is increasing. The demand both from the building trade and from the pattern trade is good. Upper grades are moving well, and a fair quantity of lower grades has been sold at satisfactory prices. Values on all grades are strong. Stocks at mill points are reported light. A little more life is reported in the demand for hardwood. The only active hardwood is oak, for which prices are well maintained. Interior finish is in good demand. Plain red oak is selling well and prices show a tendency to advance. Quarter sawed white oak is only in fair demand. Maple flooring manufacturers are doing a satisfactory trade. Hemlock prices are firm at the list, and the demand is good, particularly in the city, and larger towns. Country yards, however, are not buying very much, and are not expected to be strongly on the market until early in September. The yellow pine situation is fairly satisfactory, as a result of the manufacturers refusing to make any price concessions. Country yards are buying more freely than usual and there is a general feeling among manufacturers that a better market will be experienced from now on. The demand for shingles and lath continues only moderate, although prices have improved somewhat. White cedar shingles are in fair demand with prices about steady. Lath are active and firm.

Buffalo:—The demand for northern pine is fair, but the higher grades are rather quiet, as foundries and other concerns using pattern lumber are less active than usual. Good stock, however, is bringing a high price and will probably continue to do so, as available stocks are not large. The building trade and the box factories are using quite a lot of white pine. Plain oak is the leader among the hardwoods, and is firm in price. Birch is scarce, especially in the upper grades. Maple, elm and basswood are all in fair demand. The general hardwood trade is quiet. Hemlock prices are very low and the trade is about an average. Stocks are rather plentiful, and prices are not likely therefore to increase. Yellow pine continues fairly strong. There is a fair demand for flooring. The railroads have not come into the markets as yet. Arrivals are more plentiful than is necessary and prices are low.

Bay City and Saginaw:—The trade in Northern pine is only fair, and there are no outstanding features. Prices are firm, and the volume of lumber moving is, if anything, a little less than in previous years. Dealers are securing a certain amount of their

requirements, at other manufacturing points. A scarcity of low grade lumber is reported in the Georgian Bay district, from which a large portion of the supply is obtained for Bay City and Saginaw.

Market Corresponndence

Montreal Trade Improving

Montreal, July 10, 1911.—Lumber dealers and those engaged in the building trades in Montreal report business in good condition. Prices are steady and trade is brisk. The fact that there are no building strikes is pleasing to all interested in the lumber trade and the prospects are good for the balance of the season. There has been a scarcity of lath throughout the summer and prices have been consequently very satisfactory. Hardwoods still command excellent prices. The best qualities of spruce and pine also bring high prices. One dealer reports that buyers for the American market are hurrying up their orders, which indicates that there is a slack supply on the other side. A good deal of lumber is shipped from Quebec province by way of Lake Champlain and the White Hall Canal, particularly to New York City and points in New York State. Shipments by this route have been greatly facilitated recently by the release of hay carrying boats. These have been extensively used for the purpose of moving export lumber orders to American destinations.

Dealers are experiencing much difficulty in securing railway cars for bringing their supplies into Montreal. One extensive dealer told the representative of the Canada Lumberman that he was three weeks behind in his orders. The mills, for the same season, have been unable to ship their manufactured goods. The situation has become so serious that dealers threaten to bring the matter to the attention of the railway commission unless relief is provided within a reasonable period. The cause for this shortage is said to be that the railways already are sending their empties to the west in preparation for moving the wheat crop, which, however, is some weeks from the harvest. Lumber people do not see why they should be compelled to suffer this early in the season when the use of the cars, had they been properly distributed, would have relieved the strain, and, they would, without difficulty, have arrived in the west in ample time for the grain trade.

While the hot weather was complained of on all sides as causing much discomfort to those having to do business, the report is unanimous that trade is in excellent condition. One dealer remarked that prices were better in Ontario than in this province. He admitted that the higher prices quoted might not mean greater profits when the transportation facilities and expenses were taken into consideration.

Montreal Notes

The Richelieu Lumber Company, Montreal, was recently incorporated with a capital of $250,000 for the purpose of doing a general lumber business. The incorporators are: Mr. C. T. Desjardins, of Sorel, provisional president; Mr. A. Demers, of Montreal, secretary; Mr. J. S. Beauregard, of Montreal; Mr. Pierre Paul, of Sorel, and Mr. Ulric St. Jean, of Contrecoeur. The company's offices will be in room 44 Trust & Loan Building, No. 30 St. James Street.

The Eagle Lumber Company, of Montreal, is under contract to ship a million feet of lumber to the Liverpool and Glasgow markets. This company's splendid plant is situated at Mont Laurier, 180 miles from Montreal.

Messrs. E. & J. Maxwell, who recently established their lumber yard on St. Antoine Street near Guy Street, have built a new brick office which adds greatly to the appearance of the locality and gives an air of prosperity to their business, which is a truthful as well as gratifying sign.

The Montreal Lumber Associations are not having any meetings during the summer months on account of the hot weather. Business is transacted, so far as necessary, by the executive officers.

The month of June was an excellent one in the building trade in Montreal. No less than 323 permits for new buildings and 100 permits for repairs and alterations were issued, the cost estimated for the work being $1,550,365 for the new buildings and $230,495 for the repairs, a total of $1,780,860. During the same period in 1910 there were 263 permits for new work and 87 for repairs at a total cost of $1,585,254. The increase for the present year is, therefore, 73 permits and $195,696.

The Late Mr. John Breakey

The death of Mr. John Breakey, a prominent lumber merchant and former president of the Quebec Bank, occurred at his home at Breakeyville, near Quebec, on June 26th. Mr. Breakey had spent the winter in California for the benefit of his health. He returned about a month ago but his condition became gradually worse. He leaves a large family.

Mr. Breakey was the son of the late H. D. Breakey, a pioneer in the lumbering business on Chaudiere. He was born at Chaudiere on April 9, 1846. He had had experience in every branch of the lumbering business, including saw mill machinery and railway construction, and upon the death of his father became the proprietor of the mills at Etchemin, Quebec. After being a director of the Quebec Bank for a number of years he was elected president in 1897 and retired in 1908. He had large financial interests in the city of Quebec and surrounding district and was a liberal supporter of educational work and other elevating enterprises. His wife was a daughter of the late John Anderson, of Aberdeenshire, Scotland.

Serious Fire in Aylmer Lumber Yards

Ottawa, July 10.—There was a bad fire in Aylmer, Que., on Saturday, July 8th, when the lumber yards of R. & T. Ritchie suffered heavily. It is estimated that 15,000,000 feet B.M. of lumber was destroyed in this fire. It was piled in a yard just north of the village of Aylmer and was composed of all kinds of red and white pine and spruce. Some of it was green, while a considerable portion had been there for sometime. The cause of the fire is unknown. The lumber had been sawn for various firms by the Ritchie company. Fraser-Bryson Lumber Company, Limited, lost about $150,000 worth, which was insured at $120,000; R. & T. Ritchie lost about $60,000, covered by insurance to the extent of $50,000; W. H. McAuliffe, Ottawa, loss, $35,000, insured for $30,000; Pembroke Lumber Company, loss, $20,000, insurance $20,000; Estate of R. Hurdman, loss $10,000. insurance $10,000; Shepherd and Morse, loss $10,000, insurance $10,000; Hawkesbury Lumber Company, loss $10,000, insurance $5,000; Thomas Mackarell & Company, loss $3,000, insurance $2,000. The yard was entirely cleaned out. Mr. Ritchie states that he will build the pile henceforth farther from the village. However, the fire on Saturday caused no loss to houses in the village.

The lumber business has been very quiet during the past few weeks. The mid-summer lull is on and very few sales are being made except in the local trade. The lumber companies are shipping out a lot of lumber just now and the shortage of cars is somewhat relieved. All the companies are getting out their lumber as fast as possible now.

There is a growing tendency on the part of lumbermen to ship by rail instead of water. Many reasons are given for this, but as a rule it is chiefly due to mills changing location which makes rail shipment necessary.

Mr. C. P. Murphy, of the Ottawa Transportation Company, states that the barge trade in lumber is little over half what it was ten years ago. Then this company had about 60 barges busy in this work, while to-day there are not more than 35 employed.

Large Lumber Consumption by English Soap Makers

Liverpool, July 3.—In an earlier letter, when speaking of the extent of the box-making department of the great English soap manufacturing companies, I suggested that lumber manufacturers who might be interested in this particular field of consumption, would do well to write to the companies, saying that they would be willing to quote for supplies of wood required for box-making and asking to be informed of the sizes of the boards used. The names and addresses of some of the larger users of soft wood for box and case making in the United Kingdom will be of value to Canadian exporters of spruce, hemlock, poplar, cypress, larch and other woods which are suitable for box-making. The following are some of the larger users of box timber:—

Soap Manufacturers:—Lever Brothers, Limited, Port Sunlight, Cheshire; William Gossage & Sons, Limited, Widnes, Lancashire; United Alkali Company, Limited, Liverpool; Joseph Crosfield & Sons, Limited, Warrington; E. Cook & Company, Limited, London; Chiswick Soap Company, Limited, London; Price's Patent Candle Company, Limited, London; "Pears Soap Works," London; T. H. Harris & Sons, Stratford, London; Christopher Thomas & Brothers, Limited, Bristol; W. G. Smith, Kingston on Thames, London; Joshua Margerison & Company, Preston; J. Watson & Sons, Limited, Leeds; Isdale & McCallum, Paisley, Scotland; Tyson, Richmond & Jones, Liverpool; J. Hargreaves & Son, Limited, Liverpool; Goodwin's Limited, Ordsall Lane, Manchester.

The extensive dry soap making business, known as "Hudson's," at Bankhall, Liverpool, is now associated with Lever Brothers, Limited, of Port Sunlight; as is also the metal polishing soap business known as "Brooks." Hudson's dry soap works, Liverpool, have long been one of the larger box-making and using industries in the United Kingdom. A letter re supplies of wood should be addressed to the manager, Hudson's dry soap works, Bankhall, Liverpool.

Industries somewhat allied to those afore given, in which large

DRIED FRUITS

WE have never in all our experience seen dried fruits such a close clean up at this time of the year as at present exists. Stocks of Apples and Prunes are completely exhausted. Raisins and Peaches are sky high and the only moderate priced fruits which are suitable for the Camp are Dates and Figs. We offer as follows :

Choice Bright Fat Natural Figs, in 30 lb. Canvas Bags, at 4¼
Choice Quality Hallowee Dates, in 60 lb. Boxes, at 4¾

CAMP BLEND TEA

quantities of wood for box-making are used almost by the ship-load, and as "first-hand" as the wood can be got, are: Reckitt & Sons, Limited, Hull; Bryant & May, Bow, London; Day & Martin, London; Diamond Match Company, (Branch of Bryant & May, Limited), Seaforth, Liverpool; W. G. Nixey, Soho Square, London; Maguire, Miller & Company, Liverpool; W. Edge & Sons, Bolton; Patent Borax Company, Limited, Ladywood, Birmingham; Shearer & Harvey, Glasgow, Scotland; "Martindales," Hanover street, Liverpool; Raimes & Company, Limited, Stockton-on-Tees; Wm. Berry, Limited, Manchester; W. H. Holland & Company, Limited, Bolton; S. J. Moreland, & Sons, Gloucester.

A letter addressed to any of the afore-named firms, with the name of the town, as given, and the addition, "England," or "Scotland," as required, would reach the head office and would be placed in the right hands for proper attention. Several of the firms named use, continuously, much larger quantities of timber than many builders, joiners and furniture makers who are regarded as being in an extensive way of business. Most of them also buy "first-hand," or through brokers or agents, buying "first-hand" for them. In some cases the wood for boxes is received ready cut to size, and ready to be passed to the box-nailing machines. By importing in this way, freight charges are reduced, less store space, is required at works; less room is wanted for sawing machinery, and for cutting up, and the wood, cut to sizes which are usually small, is handled much more easily than when the wood is imported in boards. Particulars of these different ways of importing the wood may be obtained by application to the firms.

Honoring a Member of the Lumber Trade

At the time when the bustle of the coronation stand-making business was at its height, several members of the timber trade in London were able to meet and pay a happy compliment to one of their number, Mr. B. W. Williams, of Blucher street, Walworth, London. The meeting in question took place at the offices of Denny, Mott & Dixon, Limited, Feuchurch street, on June 16. Mr. Williams is a member of one of the older families in the London timber trade, and was fitly chosen to accompany the Mayor of Southwark, Mr. Albert Wilson, to present an address from ten mayors of south London boroughs, to His Majesty the King; in the course of the royal progress through south London, on the day after the coronation. It was thought by members of the trade that some souvenir of the event ought to be given to Mr. Williams, and a sum of money sufficient to obtain a fitting souvenir, was readily provided by members of the trade. The souvenir is in the form of an oval jewelled pendant, and bears Mr. Williams' name and the inscription: "A souvenir from his London and Liverpool friends in the timber trade."

Mr. R. Vick, in a few terse remarks, stated what had been done as regards obtaining the jewel, and asked Mr. Williams to accept it, on behalf of the trade.

Mr. Williams feelingly thanked Mr. Vick and those associated with him in the matter, for the souvenir. His own family had, he said, been connected with the timber trade for over one hundred years, and it was a proud boast of his, that his whole heart was in the trade. That presentation was to him a summary of old family associations with the trade.

The members of the trade who were present entered thoroughly into the spirit of the ceremony and congratulated Mr. Williams on the distinguished and honorable position which he occupied among them.

Railway Sleepers

The renewing of sleepers is now one of the larger operations requiring the use of wood, which the railway companies of the United Kingdom have to perform. A careful "pickling" of the wood used, by thoroughly saturating it with creosote, will double the life of the wood as used without any such preserving treatment, yet the decay of sleepers goes on rapidly, and large renewal operations have to be carried out. The demands may be said to range from 100,000 to 500,000 sleepers per year. The sizes commonly used are 9 feet by 10 inches by 5 inches, and 9 feet by 10 inches by 4½ inches, but thicker wood, up to about 10 inches by 10 inches is used for special work. On the main lines of the leading railways, the upper surface of the sleeper is quite exposed to sun and rain, the ballast being used between the sleepers only, and not on top of them. Considering that the sleepers are so thoroughly impregnated with creosote, it is surprising that the burning of wood is not of frequent occurrence. One rarely hears of sleepers being fired by cinders from engines, but the wear, by exposure to all weathers, goes on uninterruptedly. Fir and red pine are most commonly used. The prices of the 4½ or 5 in. sleepers range from about 2s. 3d. to about 4s. 6d. each. The demand is steady, year by year, and there is no present prospect of wood sleepers being superseded by sleepers of any other material or of any device being adopted for securing railway metals, which would be a substitute for wood sleepers. Stocks of sleepers are replenished at convenient times for the companies, and "by tender;" prices being asked for, and one or more of the tenders received, being accepted. Delivery will be taken in specified quantities, and at stated times.

The work of pickling has opened up a new branch of treatment for railway timber, and depots now exist at which the work is carried on as methodically and economically as may be. At one such depot which I visited a few days ago several acres of land were covered with low stacks of pickled sleepers, some twelve deep; ready to be moved at any time as wanted. The supplying of sleepers to the many railway companies in the United Kingdom is a branch of the business which is worth much trouble to secure as the quantities wanted are always large; the replenishing of stocks has to be done frequently, and the railway companies are among the best of the great trading corporations to do business with.

J. H. Q.

Timber Trade Facilities in South Wales

The accommodation at the Barry Docks for the timber trade consists of 114 acres of water space. The quays, which extend for upwards of 6,000 feet, are wide and supplied with railway lines, which enable goods to be forwarded to all parts of the country with the greatest possible despatch. For the discharging and loading of timber 48 hydraulic cranes have been provided, varying in capacity from 30 cwts. to 50 tons. There is a large area of land for timber storage, and large additional areas are available for letting as sites for the erection of sawmills and wood factories.

The Barry Docks occupy a central position for serving the South Wales coal field and the enormous population dependent thereon and are also excellently situated for serving the large centres of manufacture included in the Midlands.

S. P. Musson, Son & Company, Barbados, report as follows under date of June 24: Lumberstuffs.—White Pine—Arrivals during the fortnight consist of the Trn. Schr. "General Laurie" from Halifax, N.S., with 150 m. ft. which was sold to arrive at $31.50 for merchantable, and $24 for second quality, and the Trn. Schr. "Wilfred M." from St. John, N.B., with 105 m. ft. now on offer. These cargoes have satisfied present requirements. Spruce—Two cargoes have ar-

All Belt Users

Agree More Power Means More Profit

Anything making for more POWER or less FRICTION is of much interest to all BELT USERS.

To get the most possible POWER, SPEED and ECONOMY from BELTS IS A PROBLEM we have studied for 30 years.

From these years of experiments and developments we have produced as near an Ideal Belt as seems possible.

We are called BELT SPECIALISTS and in AMPHIBIA BELTS are producing the highest attainment in the Belt World.

AMPHIBIA Belts are Waterproof

They are not affected by Steam, Water, damp air or any similar adverse conditions and we guarantee them, against opening of laps through exposure to water or steam. No need to say how we make them. You are more interested in what they WILL DO.

They will do more work than just ORDINARY Belts and with less cost for UP KEEP.

There is an AMPHIBA BELT for every purpose.

We will let you prove

AMPHIBIA EFFICIENCY

If you are contemplating the installation of any transmission equipment let us advise you more fully as to the EFFICIENCY of AMPHIBIA BELTS.

Send us your enquiries. We may be of some help. We agree that you first prove AMPHIBIA merit before any cost to you.

rived during the fortnight: the Trn. Schr. "Eddie Theirault" from Belliveau Cove with 210m. ft., and the Schr. "Basile" from Meteghan to selves with 183m. ft. Both of these cargoes had been sold to arrive at $25 for merchantable, and $21 for second quality. The "General Laurie" also brought 90m. ft. sold some time ago. The "Basile" brought 18m. ft. Hemlock, which we have not yet sold. Pitch Pine—The Trn. Schr. "Lady of Avon" arrived on the 10th with 254 m ft., which had been contracted for some time ago. Shingles—No receipts of either Gaspe or Cedar Laying but we have a cargo of the latter on the way. Both descriptions are wanted. Shooks—Receipts consist of 400 bdls. ex. S.S. "Ocamo" imported on dealtrs' account. Wood Hoops—No arrivals, stocks are sufficient for the present season.

Poles Used in Canada in 1910

The Forestry Branch of the Department of the Interior has compiled statistics dealing with the poles purchased in Canada during 1910. The total number of poles purchased was 782,841, or an increase of 118 per cent. over 1909. The total value of these poles at point of purchase was $1,043,874, and the average price of poles was $1.33 or less by 6 cents than the price per pole in 1909. Steam railroads, telephone and telegraph companies used 95 per cent. of these poles, the remaining five per cent. being used by electric roads, power and light companies. 97 per cent. of the total consumption were cedar poles, which for their cost give better service than any other wood. At present, none of these poles are treated or preserved by any method, in which respect we are far behind the United States. The United States, using in 1909, 3,738,740 poles at an average cost of $1.89, or at 50 cents more per pole than in Canada, found that it paid them to use preservative methods. During the last three years the treatment of poles has advanced rapidly, so that in 1909, 15 per cent. of the total number were treated by the creosote or other methods. This is an increase of 67 per cent. over the number treated in 1908. At present the United States have 87 timber treating plants, while Canada has none. It is to be hoped that this great inequality will soon be done away with, and that pole users in Canada may take up this cheap and rational method of securing greater service from the poles used and thus lessening the drain on the forest.

Total pulp woods and wood pulp		$19,492.178

Pulpwood and Cooperage Conditions in Northern New York

Editor "Canada Lumberman":—A mid-summer statement of the pulpwood and cooperage business in the vicinity of St. Regis Falls may be summarized as follows: The Remington-Martin Paper Company have contracted with a Quebec firm for 17,000 cords of pulpwood. This is being shipped at the present time by barge to Washington. Thence by rail to the company's mills at Raymondville, Norfolk and Norwood. Their drive of 13,000 cords was hung up last spring on account of a business difficulty. An additional 7,000 cords will be cut this season, making 20,000 cords in all to come down the river next spring. This wood will be pulled out of the St. Regis at Winthrop; thence, shipped by rail to their mills on the Rackett river.

The St. Regis Paper Company will curtail their woods operations in this vicinity, at the same time, they are lumbering extensively at Otter Lake.

The Brooklyn Cooperage Company are building several miles of extension to their log railroad running east of Meno, on the New York & Ottawa line.

A deal was recently made with F. A. Cutting (the bark dealer) for the hardwood on the Cutting tract of 8,000 acres. Next year a railroad will be built to bring this timber out.

GEORGE B. OBERTON,
North Bangor, N.Y.

An interesting announcement is made by the entomologist of the Guelph Agricultural College to the effect that an elm tree scale has been rapidly spreading among trees in the neighborhood of Toronto during the past three years.

Boss Line Lumbering Tools

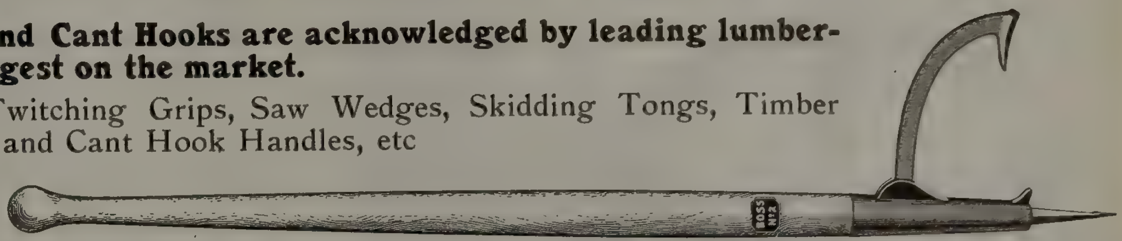
Manufactured by

The McFarlane-Neill Mfg. Co., Ltd., St. Mary's, N. B.

Forged Steel Socket Peaveys and Cant Hooks are acknowledged by leading lumbermen to be the lightest and strongest on the market.

Try our Steel Loading Blocks, Twitching Grips, Saw Wedges, Skidding Tongs, Timber Carriers, Split Rock Maple Peavey and Cant Hook Handles, etc

Catalogues furnished and prices quoted on application



Its High Daily Average, its ability to always keep a surplus of logs skidded ahead for the leading crew is what places the

CLYDE SELF-PROPELLING STEAM SKIDDER

in a class by itself. Its absolute independence of the loader prevents any interference with its fullest skidding capacity at all times and its self propelling feature saves in both moving and skidding besides the expense of switching.

ONEIDA,

The Steel Pulley of better belt contact, lightness, maximum strength.

Oneida Steel Pulleys differ from any similar produce made. And in this difference lies their strength,

In construction the Oneida Steel Pulley is ideal. It is strongly reinforced, is lighter than any other steel pulley by ⅛ to ½ and possesses greater strength. The perfectly oval crown face insures a 20% better belt adhesion.

They are built in the greatest range of sizes of any steel pulley in the world, from 6 in. to 126 in. with 2 in. to 40 in. face with ¾ in. to 8½ in. bore.

EDGINGS

Ontario

The Trout Creek Logging Company, Limited, Ont., obtained a charter.

A large quantity of lumber in piles and in cars was destroyed by fire at the town of Maxville on the R. T. R. in Glengarry County, on July 5th.

W. H. McAuliffe, of the McAuliffe-Davis Lumber Company, Ottawa, has bought 76 acres of land from the C. P. R. near Hurdman's Bridge, for $37,500.

H. E. Rudd & Company, a new firm, have just commenced the manufacture of furniture at Guelph, Ont. The company have secured a lease of the old Burr Brothers' factory.

Mayor Mullin, W. Murray and A. Kerr of Preston, Ont., have organized a company for the manufacture of woodworking machinery. The proposed capital of the company is $100,000.

A new wharf has been constructed on the river at Lakefield, Ont., available for use for the shipment of cement and lumber, with provision for railway connection, when the completion of the canal or development of traffic will render this necessary.

The ratepayers of Port Arthur, Ont., have carried a number of by-laws for municipal improvements and for the encouragement of industries. The list included guarantee bonds for the McRae hardwood factory and the McArthur match factory. The only by-law defeated was for a second ten years' exemption from taxation for the Pigeon River Lumber Company.

Extensive forest fires have prevailed during the last fortnight in Northern Ontario. In the greater part of the Porcupine country forest fires have been prevalent. At times the mining towns and prospector's settlements in the various parts of the mining country were in serious danger. Hon. Frank Cochrane, Minister of Lands and Mines for Ontario, had an exciting experience during a recent trip into the Porcupine country, at one time he and his party were in great danger of being entirely cut off by fire.

A serious fire occurred in the yards of F. McGibbon & Sons, wholesale lumber dealers, of Sarnia and Penetanguishene in their Sarnia yards on July 9. The flames spread to the Labelle, Turnbull Lumber Company, Limited, destroying the offices and four Grand Trunk cars on the siding, as well as all the lumber in the yards and a long stretch of wharves with a total loss of $160,000. The loss to the Labelle, Turnbull Company is placed at between $80,000 and $100,000, about half being covered by insurance. The loss of F. McGibbon & Sons is placed at $60,000, with insurance of about $45,000. The planing mill of F. McGibbon & Sons was with difficulty saved from the flames.

A syndicate of English and Scotch capitalists have purchased ten acres of land at Fort Frances, Ont., and intend to erect a plant for the treatment of ties, poles, posts and other timbers used in railroad construction. The plant and machinery are already on the way and work will soon commence on the mill and engine house. The plant will treat upwards of a million ties a year and will employ from 200 to 500 men. When complete it will cost over $150,000. In connection with this undertaking a recent report in the Trade & Commerce Department's Weekly Bulletin is of interest; the report said:—"The creosoting plant at the Troon Harbor sleeper mill is at present being taken assunder by workmen prior to shipment on an early date from Glasgow to Canada. Messrs. Bruce, the proprietors, are opening works at Fort Frances, Ontario, in the very centre of the timber region, and are also starting at Vancouver, B.C. The cylinder of the Troon works—which will be replaced by another later on—weighs 30 tons, and is capable of impregnating 500 sleepers at a time, or 2,000 per day. It is one of four which are being transported to the other side of the Atlantic. At their new Canadian works Messrs. Bruce will introduce the zinc-chloride-aluminum patent immersing process, which is preservative, and—what is of equal importance—fireproof. The firm have just secured an important two years' sleeper contract for a Canadian railway, and have obtained the sole rights for Canada of this improved method of treating railway sleepers."

Eastern Canada

The Hartland Woodworking Company, Limited, of Hartland, N.B., are applying for a charter with capital of $15,000.

The auction sale of the assets of the Nepisiguit Lumber Company of Bathurst, N. B., is to take place on September 7th.

The axemen and boomsmen at Sillery ,Que., recently received an advance in their wages from $1.60 and $1.80 to $2.00 and $2.20 per day.

The large saw mill and electric light plant belonging to R. O'Leary at Richibucto, N. B., have been purchased by the Swedish-Canadian Lumber Company, of which Mr. W. O. Nordin is manager.

The option which the Twitchell Lumber Company of Pittsburg, N. H., secured upon the property of the Scott Lumber Company of Fredericton, N. B., has been extended until the first of August. It is generally believed that the option will be exercised.

G. W. Faust, Limited, Montreal, Que., has been incorporated with capital of $50,000 to carry on the business of lumber dealers, timber manufacturers &c. The incorporators are: George W. Faust and Joseph A. Vincent, of Montreal.

The Dominion Tar and Chemical Company, Limited, of Sydney, N.S., have established near their factory a plant for the creosoting of timber. A car load of material was recently put through the complete process with entire success. The capital expended in the construction of the plant was in the neighborhood of $25,000. The company now employ a permanent staff of about sixty men.

Fifteen million feet of lumber, sawn for the American market was destroyed by fire at Aylmer, Que., on July 8th. The lumber was located in the yards of R. & T. Ritchie, at whose mills it had been sawn. It consisted of all kinds of red and white spruce. Some was green but a large portion of it had been seasoned. The loss of the Fraser Bryson Co. amounted to about $150,000. They carried insurance of $120,000. R. & T. Ritchie lost about $60,000 and carried insurance to the amount of $50,000. W. H. McAuliffe lost $35,000 and was insured for $30,000. The Pembroke Lumber Company's loss was $20,000, fully insured. The estate of R. Hurdman lost $10,000 fully insured. Shephard & Morse lost $10,000, fully insured. The Hawkesbury Lumber Company's loss was $10,000, with $5,000 insurance. Thomas Mackerell & Co. lost $3,000 and their insurance amounted to $2,000. The lumber in the yard was entirely destroyed.

Western Canada

The Mount Lehman Lumber, Timber and Trading Company, Limited, Mount Lehman, B. C., has been incorporated, with a capital of $30,000.

The yard of the International Lumber Company at Swift Current, Sask., was partially destroyed by fire recently. The company will now erect a brick office building.

The Princeton Lumber Company, Limited, Princeton, B.C., has been incorporated with capital of $50,000 to carry on business as lumber dealers, bridge and dock builders, etc.

The Yahk Lumber Company, Limited, Yahk, East Kootenay, B.C., has been incorporated with capital of $50,000, to carry on a real estate lumbering and general contracting business.

The Columbia River Lumber Company, 18 Hastings street, Vancouver, have been incorporated with capital of $5,000,000 to carry on a general lumbering and construction business.

The Columbia River Lumber Company, head provincial office 18 Hastings street, Vancouver, has been incorporated with capital of $5,500,000 to carry on the business of lumber dealers, dock and pier builders, etc.

The Canadian Timber Investment Company, Limited, Royal Bank Chambers, Vancouver, B. C., have been incorporated with a capital of $20,000 to carry on business as saw and shingle mill owners, timber manufacturers, etc.

The Fort Fraser Land Company, 541 Hastings street, Vancouver, has been incorporated with capital of $500,000, to carry on the business of lumber and timber merchants, saw mill owners, to build and operate pulp and paper mills, factories, etc.

The L. N. Dantzler Lumber Company, Bank of British North America Building, Vancouver, has been incorporated with capital of $500,000 to manufacture and deal in lumber and wood products. R. L. Reid,, K.C., attorney for the company.

The Port Moody, B. C. shingle mill, belonging to J. Maclean and others, was recently destroyed by fire. The main mill was a total loss, but the dry-kiln was saved. The loss is estimated at $20,000. It is partially covered by insurance.

It is estimated that between 2,000,000 and 3,000,000 feet of logs, standing timber and lumber, belonging to the Lee Lumber Company, were burned in a recent bush and lumber yard fire at Wigwam, B. C., about 18 miles south of Revelstoke.

The Powell River Pulp and Paper Company of British Columbia report that they will be in a position to commence the manufacture of paper about the middle of August. This is about a month earlier than was expected. When the mills commence operations they will turn out about 100 tons of news print paper a day.

Records of the timber branch of the Department of Lands of British Columbia for June show a total of 569 timber licenses issued on lands west of the Cascades. For lands east of the Cascades 262 licenses were issued. The Pacific log scalers during June scaled 66,000,000 feet of logs, an advance of 6,000,000 feet over the corresponding month of last year.

The Victoria Lumber & Manufacturing Company, Chemainus, B. C., are making some large improvements to their plant. A water space refuse burner, 40 ft. in diameter by 130 ft. high, is being erected. The company are also making plans for the erection of new shipping sheds with 5,000,000 feet capacity, building new railway sidings, and expect when improvements are completed to increase the rail shipping capacity by 25 to 30 cars per day. The mill is running 10 hours, the bulk of the output going to the prairies.

An important deal involving timber limits on the Arrow and Shuswap lakes in British Columbia, is nearly completed. The limits comprise 37 square miles on Shuswap lake and four square miles on Snow creek, a tributary of Cariboo creek, which flows into Arrow lake near Burton City. In all, the cruise shows, at a conservative estimate, 425,000,000 feet of standing timber. The heaviest interest in the syndicate owning these limits is held by Walter Scott, of Naksup, the other members of the syndicate being J. Gibbons and A. Symons, both of St. Leon. The limits are being purchased by parties at the coast.

Trade Enquiries

The Dominion Government, Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names and addresses of enquirers by writing to the Department of Trade and Commerce, Ottawa.

590. **Maple wood blocks.**—A correspondent in the Midlands of England is in the market for 40,000 maple wood blocks, 9 in. x 3 in. x 1⅛ in., and would like to receive quotations either from United Kingdom importers, or direct from Canadian shippers.

591. **Sycamore blocks.**—A Lancashire firm is in the market for sycamore blocks from 6 in. diameter to 48 in. lengths from 2 ft. 6 in. to 12 ft., roughly trimmed with the adze.

622. **Lumber.**—A South African firm of wholesale merchants desires to be placed in communication with Canadian manufacturers and exporters of lumber, such as Douglas fir, (or Oregon pine), spruce deals and deal ends, white pine for shelving and poplar.

644. **Building laths and lumber.**—A firm of importers having branches in Christchurch, Dunedin and Auckland, would like to act as agents for Canadian manufacturers of such.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Wire Rope

For Every Requirement

We are specialists in the manufacture of wire rope. We can ship from stock any length or size of the wire ropes usually supplied and can manufacture specially a rope exactly suitable for your requirements. Perhaps you are having wire rope troubles—if so—drop us a line advising us your requirements and we will be pleased to make suggestions as to the class and style of rope you should use. We have had years of experience—and should know.

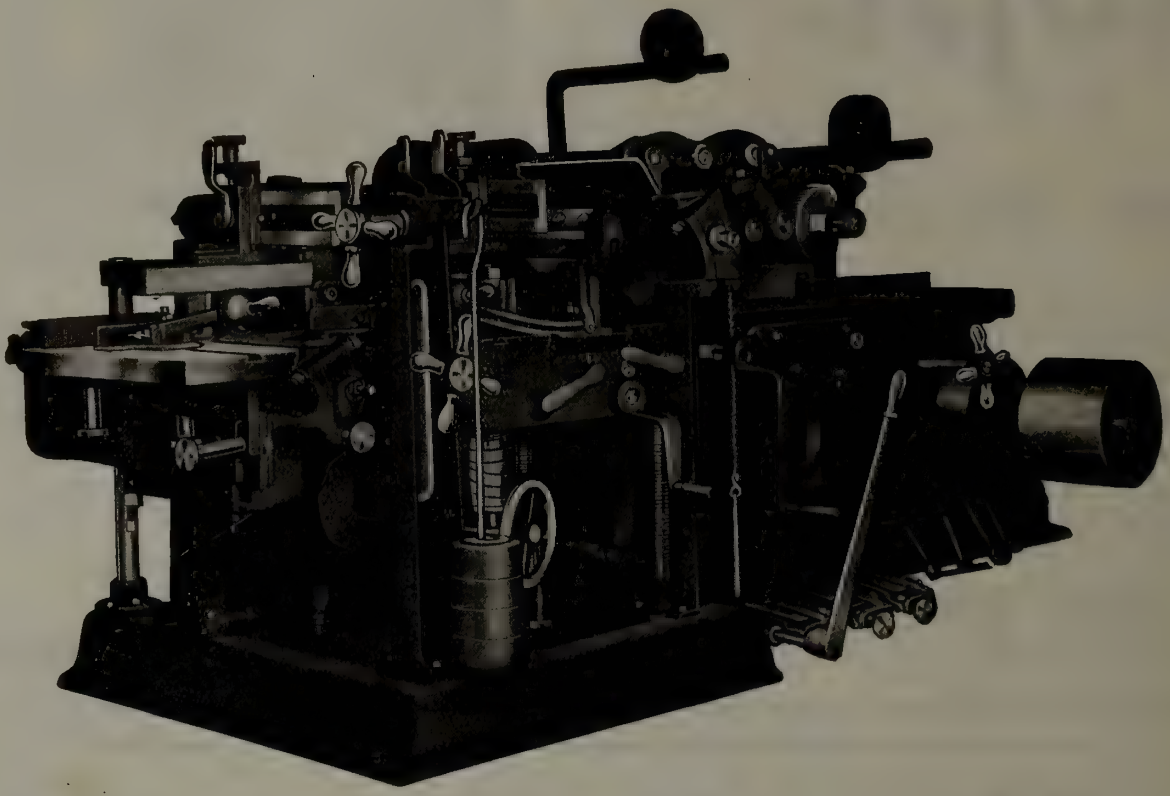
Canada Machinery Corporation

Limited



No. 303 Heavy Duty Moulder

ON BASE

THIS is without a doubt one of the heaviest and most substantial machines on the market to-day. Everything that is necessary for strength and hard continuous work is included in this machine, and all useless trappings are dispensed with.

OVER twenty mill men have ordered the No. 303 during the past few weeks. WHY? Because it delivers the goods. It earned its reputation for being the most satisfactory moulder ever offered for general work. It has only one peer. Our No. 300 inside moulder.

Write for Bulletins

Canada Machinery Corporation

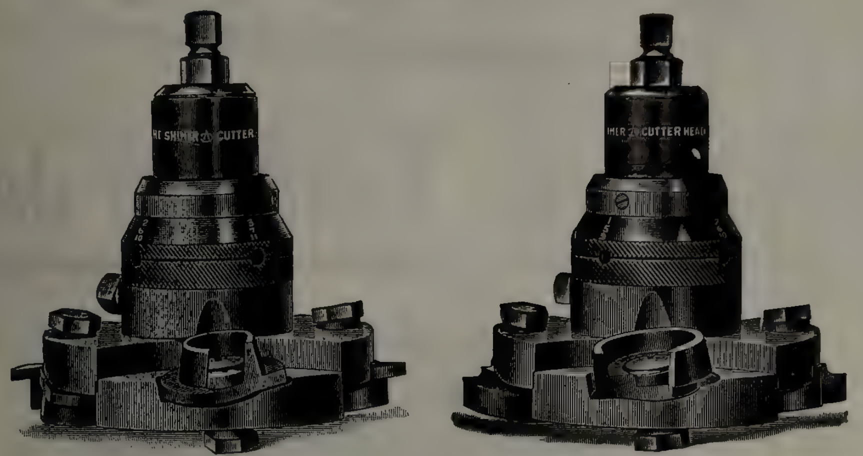
Galt, Ontario

Shimer Cutter Heads and Cutters



Our "Best of All" Figs. 202 and 203 with 4 Bits to each Head.

For Matching Hard, Cross-Grained and Knotty Lumber

THE SHIMER CUTTER HEAD

is the Only Tool You Can Rely Upon

It has Strength, Durability and Correct Working Principles. It feeds faster, works smoother, cuts true to pattern. No fitting, no trying—no filing to shape. You sharpen the Cutters with a file and set them with a guage—plain as day.

Everybody profits by their use. For Flooring, Ceiling, Siding. For Ship Lap, Jointing, Double Ceiling. For Doors, Sash and Special Designs. Coping Heads to match.

Your Capacity Increased—Your Labor and Expense Reduced.

Rossette Cutter Head

Our new Head and other tools for the purpose of making Rosettes should interest you if you do any work in this line. The Head is made with interchangeable milled Bits and turns any substantial wood turning lathe into a Rosette Making Machine with large capacity. Corner and Plynth Blocks with turned Rosettes are always in good style for interior house finish and are quickly and neatly made with this new Head.

Price, Head complete, $9.45.

Filing Stand and Tracker

This is a neat little device to fasten to a work bench for holding a Head when filing the Bits. It holds the Head with a stub spindle and is better than the ordinary pinch vice which, in time, mars the surface of a Head. The Tracker Attachment sets the Bits to share alike in the cutting.

Price, plain Filing Stand	$4.87
Price, Filing Stand with Tracker,	$11.37
Price, Extra Stub	$1.00

In ordering give the number stamped on your Shimer Cutter Head.

We make two styles of Grinding Machines to lighten and hasten the work of the filing room. Particulars sent upon request.

Cutterhead for Matching Reversible Glue Joints

turns out a most satisfactory fitting of the tongue and groove, interlocking from the same piece of matched material, requiring but one Head with Bits to produce. The jointed material will fit together when the pieces are sawed to length by simply turning the one piece end to end.

Glue Joints must depend upon accuracy as well as permanency of pattern. We guarantee both.

Prices range from $15.54 to $17.30 for a four bit Head, and from $19.96 to $22.60 for a Head with 6 Bits complete.

Bolts, Wrenches, Etc.

We carry a full stock of supplies and can fill orders promptly for anything in our line, such as Wrenches, Planer Head Bolts, Nuts, Washers, Gauges, Set Screws, Brass Washers for under Bits, etc.

A Smooth Surface

on lumber as it comes from the machine will save much of the extra labor on the Sander. For several years we have been making a Shear Cutting Cylinder which is now used almost exclusively by some of the large hard wood flooring manufacturers. It has long since passed the experimental stage and will prove all our claims for it. Send for full information.

OUR "BEST OF ALL"

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set	$40.95
Price with 6 bits to each head, the set	49.27
Price with 8 bits to each head, the set	57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—⅜ at $1.30 each and Bits for 2-in. thick plank at $1.63 each.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1¼-in.	$31.20
Price, with 4 bits to each head, the set, 2-in.	33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and to interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1½-in. thick	$34.84
Price, with 4 bits to each head, the set, 2½-in. thick	35.88

Double Ceiling Heads

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling Heads complete with Bits, net, $40.94

The Shimer Cutter Head for O.G. Batten and Siding

These heads are especially designed to work O. G. Batten or O. G. Siding, having three circular cutters in line of the cut, seated and firmly bolted to one side of the head flange.

We make them to suit any matcher or moulder. They turn out O. G. Battens as regularly as our matcher heads work tongue and groove flooring. Give measurements same as for flooring heads; or, if flooring heads are already in use on your machine, give their record numbers, and send a cross section of the batten—wood sample or drawing.

Price for each Cutter Head, without bits..	$9.75
O. G. Batten Bits to mould ¾-in. deep or less, net each	2.08

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One-way Cutters

The dealer who accepts your order for the Shimer Cutter Head and supplies you with another means to deceive you in no small matter. Look for the Name and Trade Mark "The Shimer Cutter Head" stamped on every genuine tool. Any other is spurious—send it back—demand the genuine, of quality and helpfulness, with a record of 40 years of upbuilding and improvement. It costs no more.

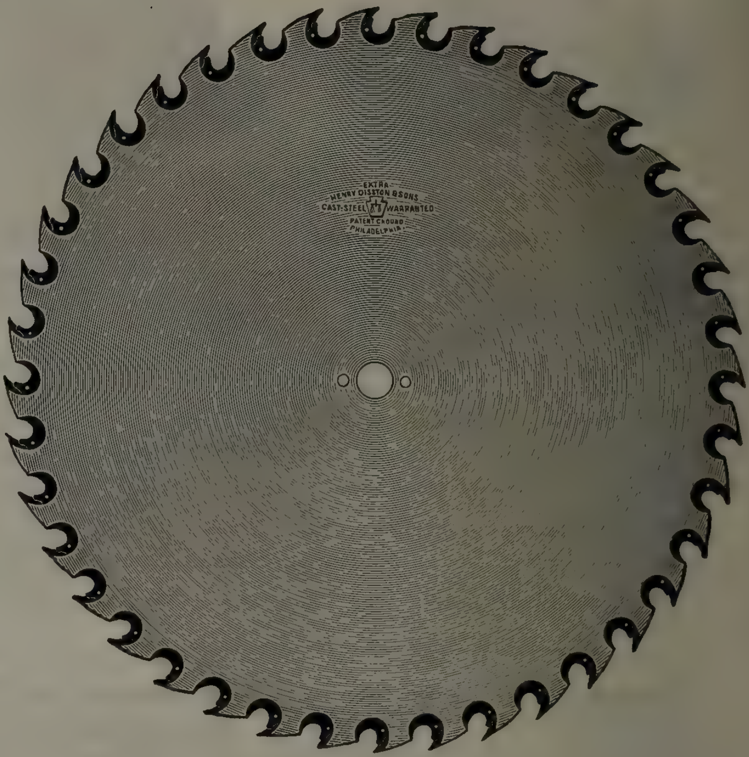
Disston

Saws Tools Files



The tool that is "cheapest in the end" is usually the one that is a little more expensive "in the beginning."

The initial cost of Disston Saws, Tools and Files may be slightly higher than that of the ordinary kind, but Disston lasts longer and is more easily kept in condition, permits faster, more efficient work, and after all, is more economical.

Disston Crucible Steel is exceptionally adapted to making high grade Saws, Tools and Files. Its uniformity and durability, in conjunction with expert shop treatments, have made Disston Tools the best on the market.

Many of the most widely favored types of saws, tools and files have been designed and invented in the Disston works. Disston improvements and innovations have always set the pace, have always led the industry.

OILDAG

(REGISTERED TRADE MARK)

Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E.E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super-heated steam practice."

The Clutch Pulley That IS Or the Clutch Pulley That WAS

The patron sat in the restaurant with offended disgust spread all over his face. "Waiter," he called, "this fish is not good. "Not good, sir?" gasped the waiter. "You thought it was excellent last week, sir. It's some of the same fish you had last week, sir."

The same truth holds with products that are not perishable as well as with those that are. There's a big difference between ancient quality and modern betterness. The best thing to do with a tradition is to bury it. Time was when clutch pulleys of the old, regular type were considered good; but since POSITIVE Combined Jaw and Friction Clutches with Combination Split Wood Rim Steel Center Pulleys have been proved by actual service under the most exacting conditions—in many cases, conditions under which no other make of clutch pulley could stand the racket—to be the only solution of absolute, complete and sure transmission of power, a new standard of excellence has been established in this field.

But here's the main point, POSITIVE Clutch Pulleys aren't better just because we say so. They're better because our customers say so after they have tried them out and know that they fulfill every claim we make for them. We leave it with you to decide whether you want the POSITIVE Clutch Pulley that IS, or some other clutch pulley that WAS.

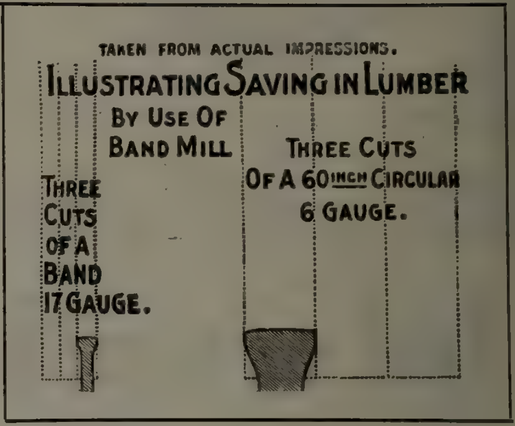
American Works, Buffalo, N. Y. - 11 Jarvis Street, TORONTO, ONT.

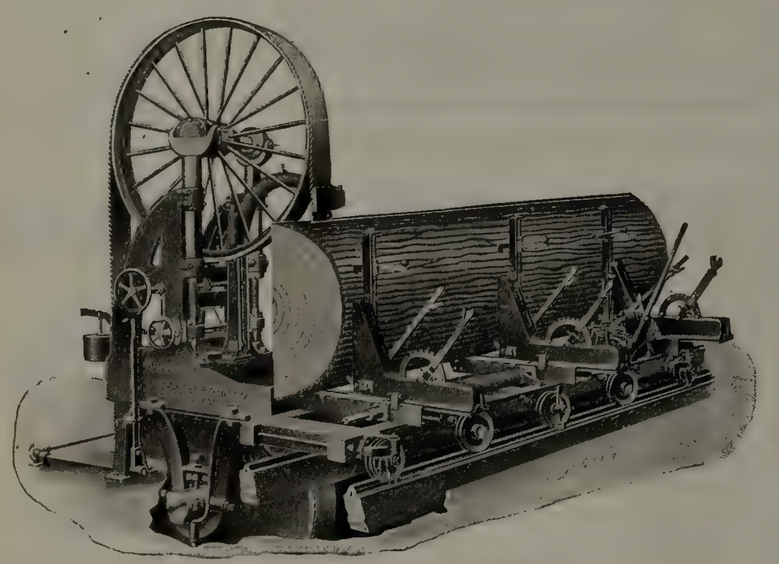
LOST

A perfectly good 1-inch board in every fifth cut when you use a circular mill instead of one of our latest type Band Mills. The drawing herewith shows graphically just what you save in kerf. Not only will you get 20 per cent more lumber out of a given amount of logs, but you will also get higher grade stock at lower production costs. Figure for yourself just what the decrease in kerf waste alone will net you in the course of a year—and we will not have to argue more for Band Mill Efficiency.



TAKEN FROM ACTUAL IMPRESSIONS.
ILLUSTRATING SAVING IN LUMBER
BY USE OF BAND MILL
THREE CUTS OF A BAND 17 GAUGE.
THREE CUTS OF A 60 INCH CIRCULAR 6 GAUGE.

Band Mills Are Not All Alike



No. 57 BAND SAW MILL

THE essential features of a modern Band Mill are first, the strain—we have in our patent knife edge device the most sensitive and positive device ever placed on a band saw; the wheels—our combination of a solid lower and a spoked upper wheel has proved the only perfect arrangement, the lower wheel controlling the upper, preventing over-running or choking in the heavy cut; third, the bearings—we now equip our mills with annular ball bearings, making them the easiest running now on the market.

FAY & EGAN MILLS are the only ones combining these three important features, permitting the use of thinner blades at higher speed than is possible on any other. The increased efficiency is obvious. Write at once for our Band Mill Catalog, sent free on request.

LOGGING AND INDUSTRIAL LOCOMOTIVES

The knowledge and experience gained in building locomotives of all types, capacities and sizes for every kind of hauling is applied to every locomotive we build, and is available to you.

Our small locomotives for logging, and light switching service are not merely selected from designs previously built, but are special designs to meet special requirements.

They are designed and built with the same care required for 200 ton locomotives. Only the best materials are used in their construction, and every part is made to jigs or templates, guaranteeing that repair parts will fit.

They are constructed with a view to the fact that they must sometimes be operated a considerable distance from shop facilities, therefore simplicity and sturdy construction are vitally necessary.

Fuel cost is always important. This is considered in the design and capacity of the boiler, and in the design throughout.

Write us concerning your requirements or ask for a consultation with our engineers.

We are in position to meet every requirement in locomotives and to supply repair parts at short notice from our Works at Longue Pointe, Montreal, Canada.

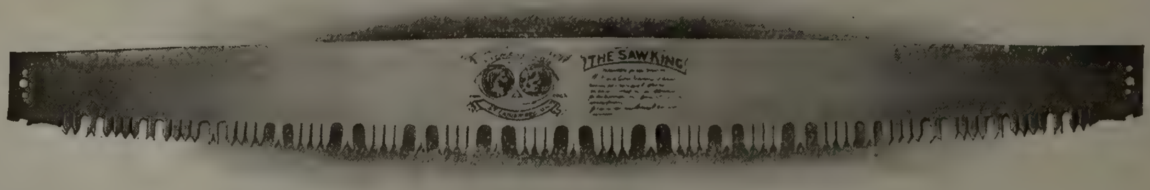
A Hard Pair to Beat

Two Saws that have proved great favorites in the lumber camps on account of their unquestionable superiority

THE "SAW KING" CROSS-CUT

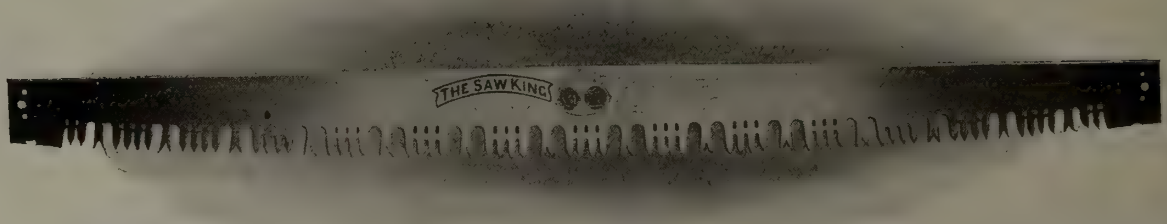


Please note the shape of the **Rakers or Drag Teeth,** and the **Gullets.** The drag teeth are so constructed that they curl the sawdust into gullets, and the gullets, by slanting from the rakers, throw the sawdust out more freely and keep the cut perfectly clear from sawdust.

The **Saw King** has merits possessed by no other saw. By looking at the above cut you will see that the chip spaces are wider and deeper in the centre than they are in any other part of the saw, thereby giving a capacity for the accommodation of the largest accumulation of sawdust, which is always in the centre of the saw. The chip spaces decrease in size from this point to the saw, as also does the quantity of sawdust. All users of saws know that the teeth at the centre wear much faster than they do at the ends, as the teeth are longest at the centre, it gives greater wearing capacity to the saw, and as the teeth are smaller at the ends of the saw and leaves the saw blades wider between the teeth and at the back. Where the blade is narrowest, it gives more strength and stiffness at the point where it is most required. This saw is tempered by our new improved process, giving it a keener cutting edge than any other crosscut saw made. This saw is thoroughly warranted. Any defective saws will be replaced by the seller.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention

THE NARROW "SAW KING" CROSS-CUT



The Narrow Saw King Crosscut Saw is specially adapted for small timber or a falling saw, and has the advantages of both a wide or hollow back Crosscut Saw.

The Narrow Saw King is a straight back saw, being bevel ground three gauges from the teeth to the back, making the saw thirteen gauge at the teeth, seventeen gauge at the back, and is only one-quarter inch wider than a Hollow Back Saw.

Please note the shape of the **Rakers or Drag Teeth,** and the **Gullets.** The drag teeth are so constructed that they curl the sawdust into the gullets, and the gullets, by slanting from the rakers, throw the sawdust out more freely and keep the cut perfectly clear from sawdust.

The Narrow Saw King has merits possessed by no other saw. By looking at the above cut you will see that the chip spaces are wider and deeper in the centre than they are in any other part of the saw, thereby giving a capacity for the accommodation of the largest accumulation of sawdust, which is always in the centre of the saw. The chip spaces decrease in size from this point to the saw, as also does the quantity of sawdust. All users of saws know that the teeth at the centre wear much faster than they do at the ends, as the teeth are longest at the centre, it gives greater wearing capacity to the saw, and as the teeth are smaller at the ends of the saw and leaves the saw blades wider between the teeth and at the back. Where the blade is narrowest, it gives more strength and stiffness at the point where it is most required. This saw is tempered by our new improved process, giving it a keener cutting edge than any other Crosscut Saw made. This saw is thoroughly warranted. Any defective saws will be replaced by the seller.

ANOTHER POPULAR "SAW KING"

The one man "SAW KING" Cross-Cut is a saw that is very popular with the Contractors, and others requiring a one-man saw. We have all lengths in stock for immediate delivery.

Dry Lumber

Like you want it ~ *When* you want it ~

Read This Letter

Woodstock, Ont., Nov. 10, 1910

Grand Rapids Veneer Works,
Grand Rapids, Mich.

Gentlemen :—

In reply to yours of the 2nd inst. would say that your Dry Kiln System has been very satisfactory to us. We have had no difficulty in drying perfectly any kind of material we use except rims. It will dry the material all right but the steam straightens them out. It is the only system in our experience that will dry gum box boards without warping. When we put in additional kilns it certainly will be your system.

Yours truly,
THE BAIN WAGON CO. LIMITED
(Signed) John A. Bain,
Vice-Prest. & Mngr.

We have letters from many more Canadian Factories and Mills which we will send you on request. They will tell you how to

Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

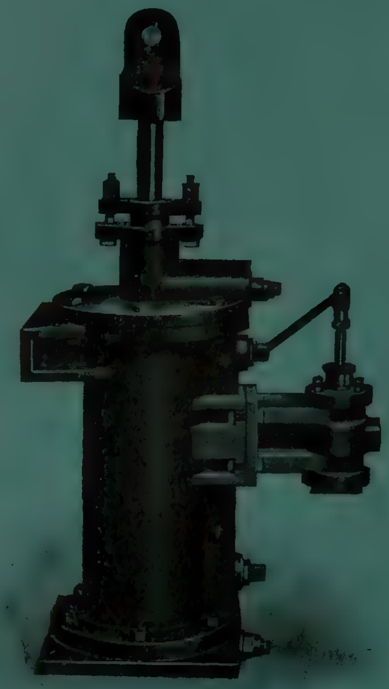
Log Handling Machinery



The cut shows the type of cylinder we have been putting on all our kickers, loaders and canters for over four years. In that time it has been thoroughly tested in many mills and its value has been thoroughly proven.

Notice that all piping between valve and cylinder has been done away with.

Notice also the check valves in head and base of cylinder. These valves cause the steam to cushion in the cylinder at each end of the stroke, thus preventing the piston or the top or bottom head being broken.

The
Grand Triumph
Shingle Machine

is probably the best known horizontal shingle machine made in Canada.

We are the original manufacturers of this machine in Canada and the only manufacturers in this country making the genuine Grand Triumph machine.

It will cut upwards of thirty thousand shingles in ten hours, and it requires for its greatest capacity only ten horse power to run it.

It cuts all of the bolt into shingles—no waste at the end. Send for our catalogue.

ED. T. SAXE, 200 Claremont Ave. MONTCLAIR, N. J.

OTTAWA, CAN.: Hope Chambers

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

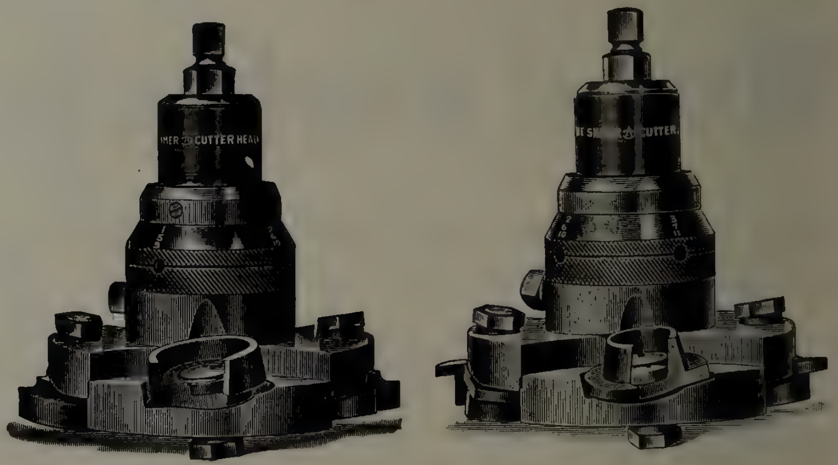
---

Quality and Quantity By Superior Fitness

Every hour saved on a job adds to the working capacity of the mill.



The Shimer Cutter Head SAVES **The Making Ready. The Filing to Shape at each Sharpening. The Fitting and Trying.**

The "made-ready" built into the Shimer Cutter Head lessens the labor and expense of keeping your work up to standard, and cuts down the time required to do the job. The time of the man who usually has to look after the "fitting and trying" or adjusting Bits for different kinds of lumber, can be utilized in more important ways.

The Expansion feature provides for quick changes in size of tongue or groove without removing the Head from the spindles. To change the fit of the tongue in the groove it is only necessary to turn the Expansion Ring—to the right to made it thinner—to the left to make it thicker. Each stop equals one-third of one-sixty-fourth of an inch. This delicate adjustment is much appreciated where the lumber varies in degrees of dryness, or when changing from one kind of lumber to another.

The pattern of the work having been turned into the Circular Bits, the shape never changes when they are sharpened. The alternate shearing cut insures perfect work on any lumber, hard or soft. Cross-grained and knotty lumber is finished with well formed edges much to your satisfaction. You can use them and profit.

The Filing Room

TRADE MARK
HANCHETT
U. S. REG. 59,352. JAN 8, 1907

In the best equipped and most efficient mills all over the country, where the value of standard equipment is appreciated—there you will find Hanchett Filing Room Equipment installed. Please note the advantages these mills have secured.

The Hanchett Filing Room Machinery are modern machines, are practical, simple, efficient, easy to adjust, easy to operate, and do first-class work. They are solid, rigid, heavy machines. Made upon honor, and they have genuine merit. The adaption of Hanchett Tools and Machinery for the care of saws and knives means quick installation, low cost of maintenance and renewals, and economy of operation.

THERE WAS A REASON WHY:

Schwager & Nettleton, Seattle, Washington, demanded Hanchett Filing Room Machinery.

SILVER'S NEW JOINTERS

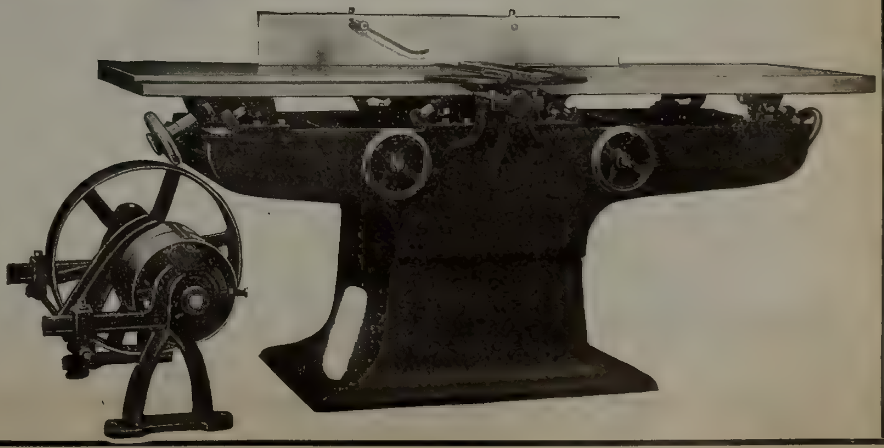
Band Saws, Saw Tables, Swing Saws

Thousands of Silver's Machines are earning big money in all parts of the world. Australia, New Zealand, South Africa and India are heavy buyers.

Silver's machines are designed for convenience and ease of operation and for rapid efficient service. Their moderate price recommends them to all wood workers.

Strong, durable, high pressure machines that will save you time and labor. Made in sizes to suit any need or any purse.

Ask for 1911 Machinery Catalog and special Canadian prices.



THE SILVER MFG. CO.,

Simonds Saws

All there is to a Saw is STEEL, SKILL and STYLE.

The Steel that is in a Simonds Saw has meant that to supply it we had to build a Steel Mill comprising seven buildings which, with yards, cover 14 acres of land. This much for the demand for Simonds Steel.

The Skill that is in a Simonds Saw requires for its operation three complete factories, one at Fitchburg, Mass., one at Chicago, Ill., and one at Montreal, Que. The skill is the result of noting and accepting improvements in methods of making Saws, as long as Saws have been made in this country.

The Style that is in a Simonds Saw comes from a close study of the style of Saws necessary for best cutting results under varying conditions. Years of experience in the Saw manufacturing business has developed an ability to select the right Saw for any particular use.

The Price that the Consumer pays for a Simonds Saw entitles him to the benefits of Simonds Steel, Skill, and Style, these three together giving results or service which means profit.

If you are in the market for any kind of a Saw, Planing Knife, or file, send your order to our nearest office for our immediate attention.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 **Toronto, August 1, 1911** **No. 15**

Ontario's Terrible Forest Fire

The most serious feature of the great forest fires which recently devastated New Ontario, was the unfortunate loss of life. For this cause alone it is apparent that the people of Ontario have a grave responsibility to face. If, in the past, we had had no lessons from experience to warn us of the danger, or if we had not possessed sufficient means to take all necessary precaution to prevent such a disaster, we might consider the result with resignation and call it a visitation of Providence which it was beyond out power to prevent. It does not appear, however, that we can take any such comforting view of the situation. Every year, for years gone by, we have had terrible instances of just the same class of disaster. Last year the great fires which occurred in Northern Minnesota and Northwestern Ontario took a sad toll of human life and destroyed untold quantities of valuable timber. It is but a few years since a similar disaster overwhelmed the country near Fernie, B.C. Last year the Western States were visited by a conflagration which destroyed enormous quantities of timber in Idaho and Montana and caused heavy loss of life. Each year it seems as if we can depend upon either the elements or the carelessness of man resulting in great forest fires, which in many cases might have been prevented. It is even now almost a matter of certainty that before 1911 has passed we will have to record further disasters, possibly as terrible as the one which has just occurred.

What is our plain duty under these circumstances? Can we escape blame if our governments and we ourselves leave anything undone which might prevent these fires? Have we and have our governments done all that we could even in the present year? In the light of what has occurred in New Ontario it is impossible to answer these questions in the affirmative.

First as to our own duties. It is incumbent upon every man who goes into the bush in our great northern wilds, not only to make a specialty of learning how to avoid and how to fight fire, but to see to it that everyone over whom he has any influence has done the same. Our great forest tracts may be well compared to a factory where explosives are produced. No one in such a factory is permitted to take the most insignificant risk of causing an explosion. Everyone is carefully instructed as to his personal behaviour whenever he is within the danger zone. So it should be in our forests, as far as the great limits of the country will permit. The forests are the most inflammable of all our natural resources. Every one who enters them should be minutely acquainted with the dangers of fire, and with the means of preventing and fighting fire.

It may seem as if this is a pretty large order. So it is, under present conditions, but it would not be long before all this could be changed if it were gone about with determination. The passing of the most carefully planned regulations will never meet the situation if means are not devised to enforce them.

Under conditions as they are to-day a man goes into the north country. He sets forth in his canoe with the rest of his party and the one idea he has in his mind is the search for valuable mineral. He carries in his kit the necessary equipment for the production of forest fires, and in his head he has little heed for the vast value of the timber through which he travels. Possibly he has read the fire regulations and has forgotten them. Sometimes during the course of his travels he may come across a fire ranger sunning himself on the bank of a river. More often, he will never see a fire ranger during all his trip. The fire regulations are forgotten and at best only ordinary precaution is often taken to extinguish fires which have been used for cooking or for warmth. Happily, as a result of sad experience, the old time prospector has become cautious and is now an influence for good so far as fire prevention is concerned. But new prospectors are going into the country every day and carrying with them the seeds of disaster.

The North country is a vast, almost uninhabited, land. To patrol it effectively, a force of fire rangers many times as numerous as the force at present employed is necessary. Above all, the men employed should be capable. This is where the present system is open to the greatest criticism. In years gone by the rangers appointed by the government of Ontario have not been the proper men for the work. Last year a change for the better was made and it is perhaps too early as yet to expect good results from the move. Forest rangers cannot be trained in a day or in a season. The man who can look after himself in the bush and who also knows how to fight a forest fire is a rarity. The Government of Ontario, if it hopes to cope with the situation successfully, must make its forest ranging staff many times larger than it is, and must take far greater efforts to secure able men for the work, than they have in the past. This will cost money, lots of money, but it is worth while.

The loss which Ontario has sustained in pulpwood alone by the recent fires would pay for a long time the cost of a much more efficient fire ranging service than could be devised. There is today absolutely no excuse for the maintenance of an inadequate service. The government sells to lumbermen the right to cut timber on its timber lands and gets a splendid price for the privilege. Its bounden duty is to see to it that nothing is left undone to protect this property from fire. On the property which is licensed to lumbermen, fire rangers are appointed by the lumbermen and paid by the lumbermen. It is the fault of the lumbermen, under these conditions, if they do not protect their own property. But they are unable to protect their limits from the danger of fire on adjoining lands which may be owned by the government. Fire upon government owned lands may spread to private owned timber and destroy it almost in the twinkling of an eye.

Mr. Geo. Gordon, M.P., of Cache Bay, one of the best known lumbermen in Ontario, is authority for the statement that the recent fires in New Ontario were all upon government owned land, and that the pulp industry of the province has suffered a severe set back from the fire. Mr. J. L. Englehart, chairman of the Temiskaming and Northern Ontario Railway Commission, in an interview which appeared in the Toronto papers on July 6th, told of serious fires which were raging along the line of the railway and in the Porcupine district on the previous day. This was a week before Porcupine and Cochrane were destroyed. If there had been an adequate forest fire fighting force in existence at that time, many of its members could have been sent in haste to the scene of the fires and possibly have prevented much of the loss of life and property.

Elsewhere in this issue of the Canada Lumberman appears an article upon the situation, written by a man who has spent much of his time in the bush and who had a hard fight against the recent fires. He presents the case as it is seen by men of experience on the spot. He is well acquainted with the men of the north and with the problems of the north. He makes out a strong case for the establishment of something far more practical in the way of a forest ranging service than has ever yet existed in Ontario.

There will always be danger of fire resulting from natural causes, and fanned by fierce gales, getting beyond the control of man, and devastating great tracts of country, but not until a great deal more has been done will the people of Ontario feel that their government is doing its plain duty. The government should commence at once to plan for the employment of many more men, and of men who are the best obtainable for the work. They may count upon the applause of every man in Ontario if they carry such a plan to success.

Effect of U. S. Passage of Reciprocity Measure

The passage of the reciprocity measure by the Senate of the United States leaves the whole problem on the shoulders of the people of Canada. As it is now generally understood that there will soon be an election in Canada, at which this will be almost the sole subject of contention, it is reasonable to believe that in the not far distant future we shall know pretty definitely just where we stand on this long drawn out and important question. The passage of the reciprocity proposals by the United States Senate has an important significance for the lumber industry both in the United States and Canada. It makes it abundantly clear that the representatives at present composing the House of Representatives and the Senate of the United States are overwhelmingly in favor of removing the duty on rough lumber. The enquiries which were conducted into the lumber situation by the committees of both the House of Representatives and the Senate brought out every argument which could be presented by the strongest supporters of a duty on rough lumber, and in their face the reciprocity measure with its free lumber has been passed. It would seem reasonable almost to believe that even if the people of Canada should refuse to pass the reciprocity measure, there is a strong likelihood of free lumber being proposed as a tariff reform measure in the United States in the near future and carried through.

Considerable interest attaches to the situation connected with the pulp and paper section of the measure which has been passed by the United States Congress. This section is different from all the others as it is really an addenda to the measure and in no way affects the other clauses. Nor is it dependent upon the other clauses. It could have been left out altogether and not have affected the negotiations one way or the other. The United States simply added this clause as a statement of their own attitude on the pulp and paper subject. The clause states that the United States will admit free of duty all mechanical or chemical pulp of wood, news print paper and other paper and paper board, the greater portion of which is manufactured from mechanical or chemical wood pulp, and valued at not more than four cents per pound; as soon as no export duty, export license fee, or export charge of any kind, is placed upon the pulp or paper and no prohibition of export is imposed. This seems to be a pretty clear statement that under conditions which prevail to-day in Canada and are likely to prevail for a long time to come, there will be no removal of the duties on pulp and paper entering the United States. The important pulpwood producing provinces of Canada have all placed prohibitory clauses on their statute books to prevent the export of their pulpwood in an unmanufactured state. Some people in both countries believe that the clause of the reciprocity agreement dealing with pulpwood and paper will be so interpreted as to admit into the United States free of duty, pulp and paper made from wood cut from private lands in Canada, as there is no export prohibition on such wood, and that in return for this Canada, if it passes the reciprocity measure, will have to admit United States paper of a value of four cents a pound or more into the country free of duty. This point remains to be settled. It is most unreasonable, however, to suppose that the people of Canada would for one moment consent to such a bartering away of their birthright for a miserable mess of pottage. Much will probably be said in the press about the immediate coming into effect of the pulp and paper clause, but unless Canada allows this clause to be interpreted distinctly to its disadvantage there is no danger of its ever having any effect whatever.

Giving Away Our Pulpwood Resources

According to a report which has been issued by the Forestry Branch of the Department of the Interior at Ottawa, Canada's foreign trade in wood pulp and pulp wood consists entirely of exports. While this is in itself a matter for some congratulation, there is, beneath the surface, a feature which is not at all satisfactory to those who desire to see Canadians make out of their natural resources all the profit that is possible, and to those who dislike the sight of a foreign country securing much of the profit of the conversion of these natural resources of Canada into finished products.

The report referred to says on this point: "Unfortunately the tendency has been to export wood in the raw form of pulpwood rather than in the manufactured form of wood pulp." The tables given in the report confirm this statement. During 1909 there were 1,537,762 cords of pulpwood manufactured in Canada and of this, 915,633 cords, or 59.5 per cent., was exported. The value of the exported article was $5,752,659. The amount of wood pulp exported during the year was 280,744 tons, valued at $4,898,842. This was about 63 per cent. of the production.

From these figures one may secure an idea of the loss to Canada which is involved in the export of the raw pulpwood. According to the report of the Forestry Branch, the 915,633 cords of pulpwood exported from Canada to the United States was manufactured into 340,615 tons of mechanical pulp and 287,514 tons of chemical pulp. Forest Products Bulletin No. 10, issued by the United States Census Bureau, shows that, on the average in the United States, a cord of wood produces about one ton of mechanical pulp or one half ton of chemical pulp, and that 37.2 per cent. of the wood imported is manufactured into mechanical pulp and 62.8 per cent. into chemical pulp. As the United States imports much more pulp than it exports, it would necessarily have imported this pulp from Canada had it not imported the wood. Exporting the wood to the United States brought in $5,752,659. Exporting the pulp which that wood made, would have brought, at the average prices paid by the United States importers in 1909, $16,719,418. If the manufacture were completed and the pulp made into paper in its final form before exporting, the difference would be still greater. It would be folly in the face of figures like these to permit of any course being accepted in Canada which would prevent the paper mills of Canada from taking advantage when the time is ripe, of the markets for paper which they are sure to find in the United States. Irrespective of any efforts of the United States to secure access to the pulpwood of Canada, the time is certain to come, in the near future, when the demand for paper on the other side of the line will be strong enough to make it possible for Canadian mills to dispose of large portions of their output to United States consumers. It is more than reasonable that in the meanwhile we should do whatever we are able to encourage the export of pulp rather than of pulp wood.

Futher light upon the situation is afforded by the report of the Forestry Branch which states that the pulpwood from Canada in 1909 furnished 46.4 per cent. of the raw material used by the 90 pulp mills of the State of New York; 10.3 per cent. of the raw material manufactured in the 62 pulp mills of New England, Maine, Massachusetts, New Hampshire and Vermont, and 6.1 per cent. of the raw material used by the 16 pulp mills of Pennsylvania. A larger quantity of pulp wood, moreover, was exported in 1909 than in 1908.

The manufacture of the 915,633 cords of wood exported in 1909 kept running at full capacity for the year, 69 of the 251 pulp mills in the United States. If this pulp wood had been reduced to pulp in Canada, it would have supplied, for the year, 73 pulp mills of the average size of those already in Canada. The greater part of the pulpwood exported was cut in Quebec. If it had been manufactured in Quebec it would have kept running 71 mills of the same size as those now existing in Quebec.

It Makes a Difference Whose Ox is Gored

Mr. Albert W. Cooper, secretary of the Western Pine Manufacturers' Association, who has his headquarters in Spokane, Wash., is out with a statement that shipments of lumber to Canadian points made substantial increases during the month of June. He predicts that the season's shipments to Canada will total 25,000,000 feet. This is very pleasant for the United States manufacturers, and it ought to make Mr. Cooper feel pleased that Canadian competition cannot keep United States lumber out of Canada. In the same report, however, Mr. Cooper makes the assertion that "the Canadian manufacturers have a strong combination," and he uses this as a comparison in connection with the charges which are being made in the United States that the lumber manufacturers have been combining unlawfully. "So far as restraint of trade is concerned," he says, "conditions certainly are worse than in the United States." It is difficult to harmonize the two statements made by Mr. Cooper, and the truth of the matter probably is to be found about half way between.

The Canadian lumber manufacturers have not by any means the "strong combination" which Mr. Cooper alleges. If they had, they would have been able to make a better showing against the lumber shipped from United States points to Canada at cut-throat prices. If the manufacturers of the United States who sell their surplus stocks in Canada at a sacrifice rather than carry them over, would only be sensible enough to cease their everlasting over-production, they would be in just as strong a position as they imagine the Canadian manufacturers to be in, and it would be a relief to the whole trade. Canadian manufacturers can make a good living out of business in a perfectly legitimate manner, so long as the competition they have to meet is reasonable, but when it is based upon over-production and sacrifice prices, there is little wonder that the Canadian consumer is willing to take the cheaper article, and that therefore the shipments to Canada should be on the increase. These figures look good to the American who feeds upon statistics, but we venture to say that if the economic side of the situation were looked into a little more closely, it would be found that on the lumber shipped into Canada in such increasing quantities there was little or no profit being made. The reason for the strength of the Canadian manufacturer, which Mr. Cooper alleges is due to combination, is something altogether different. It simply amounts to this, that the Canadian manufacturer is content with a good profit on a fair amount of business and even prefers it, to running the risk of going to the wall on a huge amount of business conducted at a loss.

We have been up against the dumping habits of United States lumber manufacturers in the Canadian markets for many years and it looks as though we will continue to be hampered with them for all time to come. It is not unreasonable, therefore, that many lumbermen in Canada should look with approval upon the proposed reciprocity arrangement which will enable Canadians to ship lumber into the United States free of duty, instead of paying $1.25 per thousand feet. Having had the freedom of our markets for rough lumber for so many years, the manufacturers of the United States, in fair play, ought to let us see if we cannot even matters up a little in future. They see, however, a small advantage to be gained by Canadians in the matter of the duties upon dressed lumber and they have made a great objection to the whole proposal on this ground. In the past when the advantage was all on their own side they made no bones about using it to the limit, but when it looks as though the boot may be placed on the other foot they feel displeased. W doubt very much whether with the alterations which are proposed in the tariff, Canadian lumber will cut a big enough figure in United States markets to make any single manufacturer in that country feel the difference. But apparently there is a matter of principle at stake, and it makes all the difference in the world, whose ox is to be gored.

Editorial Short Lengths for Busy Readers

The latest reports received upon the prospects for the apple crop in Canada this year are quite promising and the probability therefore is that there will be a good demand for apple barrel stock.

Albert W. Cooper, secretary of the Western Pine Manufacturers' Association, estimates that lumber shipments from eastern Washington and northern Idaho mills to British Columbia and other provinces in western Canada will reach fully 25,000,000 feet this season, based on the present demand. Shipments of pine from the Spokane territory since last January have averaged ninety cars a month, an increase of 100 per cent. over the first six months of 1910.

The widespread strike among the shipping laborers in Great Britain caused much uneasiness to the lumber trade. An enormous stoppage of shipping resulted in congestion at the ports affected and when matters were settled the railways were unable to keep pace with the rush. The advanced wages which it has been agreed will be paid at certain ports, to the deal porters, will prove a further tax upon profits, experience having shown the impossibility of transferring these extra imposts to consumers' shoulders. At Liverpool the strike had a most serious effect upon the shipments by Canadian liners. Thousands of men left the docks even from those firms which had made all the concessions at first demanded by the dock laborers. This was evidently done to force other firms to come into line. When the strike commenced, Canadian liners were discharging the first shipment of the new season's goods, but when the quay laborers joined force with the sea-faring men, the goods landed from the vessels could not be removed from the quays. Many vessels had to leave the docks only half loaded. Timber carters, who were not concerned in the dispute, were unable to go down upon the docks to bring away goods for fear of molestation.

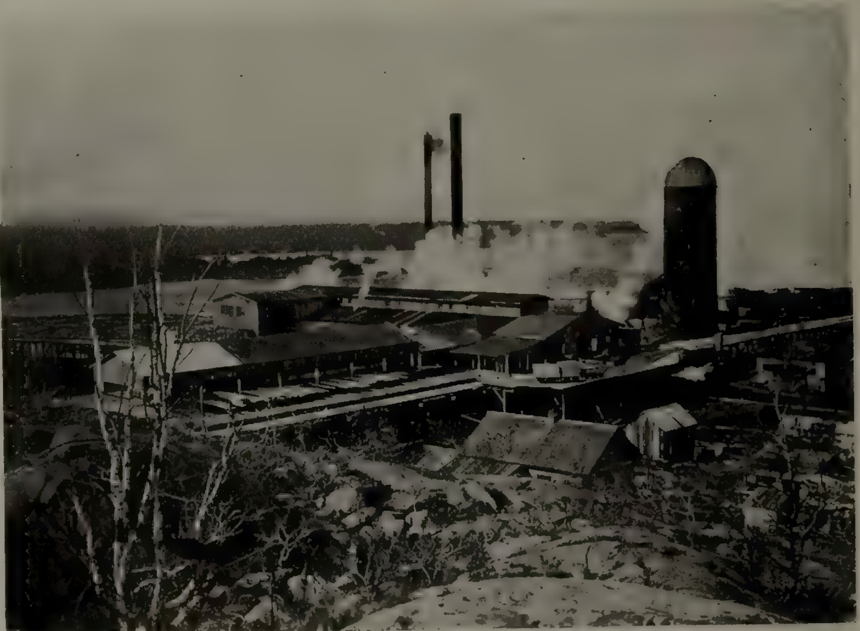
Mr. George Gordon, M.P. for Nipissing, of George Gordon & Company, Cache Bay, Ont., reports that the forest fires in Northern Ontario have dealt a severe blow to the pulp and paper industry of Canada. "The timber destroyed," he says, "has been nearly all spruce and jack pine. There were some splendid opportunities to establish pulp and paper mills in the district which has been swept by the fire. There has been no heavy loss among the lumber companies as the timber burned was practically all on Crown lands."

Important Sawmills of the Georgian Bay

No. 3.—The Spanish River Lumber Company's Operations — Well Equipped Mill Turning Out 175,000 Feet of Excellent Lumber Per Day

Mr. B. W. Arnold, President

Mr. W. J. Bell, Vice-President



Spanish Mills Company, Limited—General View of Mills.

THE Spanish River Lumber Co., of Massey and Spanish Mills, Ont., was one of the first lumbering companies to take out a charter as a joint stock company in Ontario. Their charter dates back about thirty years. The company was organized by Messrs. Arnold of Albany, N. Y., Folsom, of Bay City, Mich., and James of New York. The company is now composed of Mr. B. W. Arnold, of Albany—a son of the originator of the company—and Mr. W. J. Bell of Sudbury, who occupy the positions of president, and vice-president and general manager, respectively.

The mills of the company are located on the east end of Aird Island, in the Channel between Manitoulin Island and the North shore of Georgian Bay, a distance of about two miles from the mouth of the Spanish River, whence the company's supply of logs is principally drawn. It is reached after a delightful trip on the steamer which runs between Cutler and Little Current.

The limits on which the company operate are located on the north shore of Georgian Bay, and on the Spanish and Sable Rivers. The headquarters for the logging operations are at Massey, and a branch office is located at Webwood. This part of the company's work is under the management of a subsidiary company, known as the Sable Logging Company, of which Mr. J. A. Ferguson of Massey is the Woods Superintendent. During the logging season the company employ about 1000 men in the woods.

The sawing end of the company's business is managed by another subsidiary company known as the Spanish Mills Company, Limited, in which Mr. J. O. Smith Superintendent, and Mr. A. J. McDonnell, Sec.-treasurer, have an interest.

The Spanish Mills sawing plant is one of the best equipped on the north shore. Its capacity is about 175,000 feet in ten hours. The equipment consists of one single cutting band saw, one gang saw, one twin band slabber, one rift edger, one horizontal resaw, two edgers, etc. in addition to a well equipped lath and picket mill. In connection with the saw mill plant the company have about one and a half miles of tramways and a piling capacity of about 20,000,000 feet. They have daily connection with the C.P.R. Soo Line at Cutler by means of the mail and passenger boat from Little Current. The Spanish Mills is also a point of call for the steamers of the Northern Navigation Company. The company are also connected with the Railway at Spanish Station by private telephone line. The output of the Spanish Mills is principally white pine with a small percentage of Norway. Up to the present time it has been marketed almost entirely by cargo shipments to the United States at points on the Great Lakes from Chicago to Buffalo.

For the handling of logs, in connection with their plant, the company have a powerful tug, the "Fanny Arnold" and also a 35-foot gasoline launch equipped with powerful heavy service engines, which is used for picking up logs and despatch purposes.

The employees at the mill are well looked after and comfortably housed. The company have from thirty to forty dwelling houses

Spanish Mills Company, Limited—Loading Scene.

Spanish Mills Company, Limited—View from the Mill.

Spanish Mills Company, Limited—View of Jack Ladders.

which are rented to the employees. The majority of the employees however, are cared for in two large boarding houses which are equipped with all modern conveniences such as electric light, running water, etc. The dormitories are laid out in small rooms each containing two single beds. The boarding houses are conducted on the plan of a hotel and are considered the equal of the average modern hotel. The company also operate a general store in connection with the plant.

The power equipment of the mills consists of six large boilers. The main engine is of 26 inch diameter and 34 inch stroke. The band saw, rift edger and lath machinery are run by independent engines. The lighting plant consists of an engine and dynamo which furnish current for about 700 16-candle power lamps. This plant lights the entire premises, tramways and village.

With their excellent mill and piling capacity and the location of the mill, about two miles only from the mouth of the Spanish River, where the logs are secured, the Spanish Mills Company are in a splendid position for producing lumber of excellent quality, at a minimum of cost. They have in fact one of the most complete and successful lumber manufacturing plants and organizations to be found anywhere in Canada.

Since the above description was written the Spanish Mills Company, Limited, have had a severe loss by fire. On Monday, July 17th, flames destroyed part of their mill, and the wharf adjoining. According to reports received, the loss amounted to about $35,000, which was completely covered by insurance.

A large number of college students are working in the mills at Campbellton and other New Brunswick manufacturing points. The majority are studying forestry and putting in their summer at the mills so as to obtain a first hand knowledge of the lumber manufacturing business. Several Harvard and Yale men are in the mills at Campbellton.

Spanish Mills Company, Limited—Forwarding from the Pile.

Decision Reached in Customs Case

Measurement of Thin End to be Basis of Duty on Canadian Lumber Entering United States

The United States Customs Court of Appeals recently handed down the following decision, of great interest and importance to importers of Canadian products. It is a decision in an action brought by the treasury department against certain importers of Canadian spruce, in which the department sought to maintain that the duty on 1¾ inch and 1⅞ inch stock was assessible on the basis of two inch. The board of general appraisers of New York decided against the treasury department in this matter and in favor of the lumber interests. Subsequently the treasury department appealed the case to the Court of Customs Appeals and that court affirmed the decision of the appraisers.

The decision in full is as follows:—

These two cases involve the question of the proper measurement of spruce lumber imported from Canada. It was entered and the entry liquidated as 1¾-inch lumber. Subsequently, by direction of the assistant secretary of the treasury, the entry was reliquidated on the basis of 2 inches, on which reliquidation the importers appealed to the board of general appraisers, where the action of the collector in reliquidating was set aside, and a new reliquidation ordered on the basis of 1¾ inches.

The question involved is mainly a question of fact. The evidence in the case shows, practically without contradiction, that by the custom of the trade 1⅞-inch spruce is not recognized as a merchantable denomination, but that when lumber is delivered 1⅞ inches in thickness it is actually measured on the basis of 1¾ inches and so settled for. This rule of measurement was recognized by the department as early as September 5, 1884 (T. D. 5379), and so far as the record shows, this ruling has been recognized by the treasury department since that time.

There was also evidence on the part of the importer which showed that when it is ascertained that a board measures thicker at one end than at the other, the thin end is taken as the true measurement, and there is no dispute about this custom of the trade. To illustrate, if a board is 2 inches or more at one end, and is 1¾ inches at the other end, it would be entered at 1¾-inch stuff. The testimony by the shippers and by those who had to deal with the lumber tended to show that this lumber was in fact practically all 1¾-inch, according to this standard. Much of it ran as high as 1⅞ inches; some boards were found that measured 2 inches or more at the thick end, or as scant as 1¾ inches at the thin end.

The testimony would be very convincing and indeed very conclusive if it stood uncontradicted. The government, however, produced two government inspectors who testified that they found the lumber to scale 2 inches in thickness. The testimony shows that they examined but a small portion of the lumber, relatively, and what is more significant is that by their testimony it appears that if they found the lumber running a trifle over 2 inches at one end and scant at the other end, they attempted to average the piece, and determined that it should measure 2 inches. The answer of one witness is illustrative:

I found the majority of it 2 inches even, some of it running a trifle over 2 inches, and some a trifle less, which would bring the average at 2 inches.

And in response to the question:

Q. You think it's impossible to get the exact thickness in rough lumber? A. It can be done by taking time to go over every piece at both ends and averaging the thickness. On rough lumber it doesn't run the same.

The other witness for the government testified:

Q. Suppose you found lumber full 2 inches at one end, did you measure the other end to see if it would run over that or not? A. As a rule, we measure about two-thirds from the end.

Q. You never measure the thin end? A. We do measure the thin end; yes.

Q. Which controls; thin or thick? A. Neither one. I generally take the average.

It is manifest that these witnesses ignored the established trade custom, and a custom which appears very reasonable on its face, of estimating the lumber upon the basis of the thin end.

The other testimony offered by the government was evidence that this lumber was sold as 2-inch lumber. The evidence shows that it is the custom which obtains in the wholesale trade of selling scant 2-inch lumber and billing it as 2-inch lumber, the difference to the wholesaler being made in the price, and by a number of witnesses it was shown that lumber billed at the price at which this was purchased was treated and regarded as settled for on the basis of 1¾ inches. The proof upon this point is very strong and convincing.

The decision of the board is affirmed.

Uniform Grading and Inspection Needed

Widespread Approval of Proposal for a Bureau of Inspectors Opportunity Now for Removing Root of Many Trade Evils—

The articles which have recently been published in the Canada Lumberman upon the necessity for adopting some standard set of rules for the grading of lumber, and the advantage which would result from the appointment also of a bureau of inspectors to look into all complaints about shipments of lumber, have met with much approval. Letters have been received from many members of the trade, representing its different branches, and they are, almost without exception, heartily in favor of the general principles laid down in the articles. The concensus of opinion is that the man who does not wish to trade on a fair and business-like basis is a menace to the trade and ought to be obliged to mend his ways or abandon the business. Some of the manufacturers have taken vigorously to the proposal and have written to the Canada Lumberman the strongest letters which have been received upon the question. They realize that they will be among those who will benefit most from any change which is made in the direction proposed.

The only serious objection to the plan is the fact that the trade is so strongly divided into sections which cater to widely differing markets. The very fact that these markets differ so greatly will, in a sense, simplify the work of adopting grading systems. No one contemplates a completely uniform system to cover the whole of Canada. This might be possible some day, but at present it is not. It is possible, however, that the trade in each large district should adopt a grading system which would be practical, and permit of carrying on the trade to which the mills in that district cater, in a much more reasonable and comfortable manner. At the present time the trade in Ontario is badly demoralized on account of the lack of uniformity in grading. The manufacturers, wholesalers and retailers in Ontario, however, are likely, if the letters received by the Canada Lumberman are a true indication, to approve and adopt a plan which will put an end to their troubles.

There is no danger of the manufacturers having to change their systems or of their losing on account of such a change in grading. The great trouble to-day is that a retailer does not want to pay for "box" lumber at the price of "common and dressing." The general run of the trade in Ontario is in "common and dressing" grades. Under present conditions a retailer very often gets a lot of "box" lumber in a shipment of "common and dressing" and he naturally objects to paying for it at the "common and dressing" price. If a definite system of grading is adopted, the first thing to decide will be the exact meaning of "common and dressing." Then, when a retailer gives an order for "common and dressing," both parties to the deal will understand what is wanted. If the manufacturer or wholesaler then puts "box" lumber in the shipment, it simply amounts to a question of the customer refusing the shipment or the seller agreeing to accept a lower price for the "box" lumber which it contains. The removal of all uncertainty as to the meaning of "common and dressing" will make it possible for all members of the trade to understand one another thoroughly and will prevent many of the disputes which are now a matter of daily occurrence. The other grades can be worked out in a similar manner and by degrees it should be possible to introduce a measure of certainty throughout the whole trade in Canada, which would be a great boon.

If the suggestions which have been made in the Canada Lumberman are to be put into practice, it will be necessary for the trade to take the matter in hand vigorously and push it to completion. The time at present is most oppotrune. A small committee appointed by each of the branches of the trade could have a few meetings and quickly put the matter in working shape. It would be necessary for the committee to draw up a set of grading rules and submit them to the bodies which they represent. Once these rules were adopted they could be put into practice almost immediately. A bureau of inspectors could be appointed as soon as it was ascertained that the trade would be willing to meet the expenditure entailed. In the matter of a few weeks, and at an expenditure of a relatively small sum, one of the most beneficial reforms which it is possible to inaugurate in the lumber trade could now be brought about.

A few prominent members of the Ontario trade are already moving in connection with such a plan. They will need the active support of all others in the trade.

Following are some of the letters which have been received by the Canada Lumberman in regard to the articles which have already appeared in this paper upon the subject:—

No Two Manufacturers with the Same System

Editor Canada Lumberman:—I have read the articles in your issue of July 1st, over the signature of "Wholesaler," also the one in the mid-month issue, signed "J. C. Wood." Now I think that everyone connected with both the wholesale and retail end of the business will heartily endorse every argument advanced in favor of "Authorized Rules for the Grading of White Pine," in particular. With the present state of affairs we do not know of two manufacturers that have the same system of grading, or the same opinion of what constitutes a No. 1, 2, or 3 cut. The present arrangement may be all right from their standpoint, but it certainly is very unsatisfactory from that of the buyer, and we expect, in many cases, also to the seller. What is wanted is a couple of good practical inspectors, who may be called in, in case of dispute, but we first want the grading established and a general acceptance by the representative firms in the trade, and with this accomplished, we will be in a much better shape than at present, even should we go no farther.

The price of lumber at present, has advanced to such an extent that even a slight difference of opinion as to grades and measurement often represents several dollars on a carload, and our experience has been that the grades have been continually declining, as the prices have advanced. I will venture to say that what we buy to-day as a No. 3 cut, was shipped out as box, between ten and fifteen years ago, and other qualities have suffered, although probably not to the extent that these cut up lines have.

Another innovation which has been to the disadvantage of the buyer is the change in the assortment as to lengths. Until a few years ago, the majority of mill men put their stock up twelve feet and longer. To-day it is almost impossible to find a stock that does not include the ten and eleven-foot, with the long lengths.

Another feature presents itself to my mind. Why should there not be an authorized standard template used for matching, by the different people who do this work? At present every man who runs a matcher has his own ideas how the work should be done, and a shipment from two different mills will almost invariably prove to be a misfit, when with an adopted standard the fag ends could be worked up.—Thomas Patterson, Hamilton, Ont.

Not a Question of Competition

Editor Canada Lumberman.—I have found among business men, and especially toward competitors, a disposition to tell nothing that would help the competitor. The attitude is, generally, mum. In fact, some practice the habit of telling the opposite of the truth. For instance, it seems an utter impossibility to extract from the lumber trade a standard of grading, each one thinks that if he tells his idea of grading the other fellow will find out and enter competition with him more keenly, and so he is not going to tell, teach or instruct any one. "Let them find out for themselves," is the attitude they adopt. This seems to me all wrong. The man who is most desired as a competitor is he who knows most about his line of business. For instance, a man who knows his business thoroughly knows how to give a price, and what a thing is worth.

It's the man who knows most about his business that keeps up the intrinsic value and standard of his particular trade and helps to keep up prices, values, and an appreciable standard all round, and makes a living and prosperity to his less competent rival more possible. With the man who knows his business nothing can prevent his success.

A man who is doing right, rendering good value and service, fears no competition.

I notice too, that if you ask your competitor how he is getting on, according as he deems it discreet, he either tells you he is doing four times more than he is or four times less. How absurd this is; none of this kind of talk fools any one. It only hurts the one who does this kind of talking. I also have noted that some competitors speak in a disparaging way about each other. One can readily see how foolish this is.

I hope, Mr. Editor, you can get the lumbermen to agree on some kind of standard in all lines. Yours truly, "Knots."

A Disgrace to the Lumber Business

Editor Canada Lumberman,—I have read the wholesaler's letter on page 30, and your editorial on page 21 of the Canada Lumberman, July 1st, and I fully endorse every word written in both articles. I have had over thirty years' experience in lumber in both pine and hardwood, and I regret to say that I have never seen the trade in a more deplorable condition than it is at present in regard to the inspection and grading of lumber. especially hardwood. Here in Canada it is common and better or log run and mill run, and the man that buys on such inspection is beaten in most every case, and there is no redress. He has no claim in a court of law; why? Because there is no uniform grading, and he can lay no claim. Twenty years ago we bought our lumber on grade, and it should be the same to-day. The price has gone up. Why should the grade be lowered? I would suggest that a standard rule of grading be adopted and each and every grade bought and sold separately on grade price. Have an inspection bureau; engage three competent and experienced, practical, unbiased inspectors; one to be engaged by our local legislature, one by the Dominion Government, and one by the Lumbermen's Association, and when one or all of the inspectors are called upon to adjust a claim, the party at fault to pay the expense incurred. All invoices to be produced and examined by the inspectors if required, and if there is found to be raising of grades or invoices with the dealer, impose a fine or advertise him. Freeze him out. He is a disgrace to the business and should serve a term inside prison walls.—(Signed) Wholesaler.

How They Do It in British Columbia

Editor Canada Lumberman,—We note that your article on "Grading and Inspection of Lumber," is written by an Ontario wholesaler, and refers to conditions in Ontario. We in British Columbia have overcome the conditions complained of by the wholesaler writing the article, by the establishment of a grading committee who establish grading rules, and appoint grading inspectors to go round from mill to mill, keeping the inspection at each mill uniform. These inspectors also make reports to the management of each mill after each inspection, and this report shows the percentages above grade and below grade. The plan has worked out very satisfactorily in British Columbia. E. H. Heaps & Company, Limited.

Definite Rules to Govern Each Grade

Editor Canada Lumberman,—We wish to heartily endorse your suggestion for a system of grading and official inspection bureau, as we are sure it would be better for everybody concerned to have some definite and set rules to govern each grade of lumber, so that each mill and plant which wishes to co-operate in this respect would be making the same uniform grade as the others. As it is now, we all make our grades as we see fit, and one is better and one will be poorer than the other, and the man with the better grade very seldom gets any better price for his stock than the man who makes the poorer grade, or at least not enough for the difference in the grades.

This is being done all over the United States, and when a man buys a certain grade of lumber, if it is not up to standard when he receives it, it can be referred to a competent inspector anad the case is settled there and then, and in our opinion this is the only way to settle disputes of this kind. White Pine Lumber Company, Blind River, Ont., per R. W. Wells.

Grades and Lengths at Sixes and Sevens

Editor Canada Lumberman,—We feel that you are right in regard to the grading and inspection of lumber, as not only do the gradings vary, but in the lower grades, the lengths permitted in the various grades. This is a condition which is not satisfactory to either buyer or seller and anything which can be done to standardize the grades of all the mills would be helpful to the entire trade.

On the other hand, it might be difficult to apply this all along the line, as many of the mills ship by rail to eastern Canada and for export, where a certain set of rules prevail, and a number of the others, particularly the cargo shipping mills on the Georgian Bay, ship very largely to the Great Lakes cargo trade, which supposedly takes the same inspection as the cargo inspection at Duluth. Some mills have both classes of customers and it strikes us that the views of these mills would be of particular interest in this connection as they must be familiar with both methods of grading. Wolverine Cedar & Lumber Company, per R. E. Edwards.

Disputes Coutinually Arising

Editor Canada Lumberman,—We fully realize that the grading and inspection of lumber are not what they should be. Disputes are continually arising and nearly all the trouble seems to come from incompetent inspection. Speaking for our own firm, we receive many car loads that are not what we have purchased, and we think that seventy-five per cent. of the dissatisfaction arises from the inspectors' end and the balance from the traveller.

We should like very much to see such steps taken as would lead to satisfaction with the wholesalers and retailers and we think that the solution as outlined on page 30 of the Canada Lumberman, July 1st, would be a most fair one. We would willingly pay our portion of the salaries of licensed inspectors.—Knight Bros. & McKinnon, Limited, Cobalt, Ont., per P. McCauley.

Inspection Would be an Advantage

Editor Canada Lumberman,—We endorse the article on page 30, as well as the editorial on page 21 of the Canada Lumberman, July 1st edition. Personally, we do not have very much use for an inspector of this kind, but as we are not infallible, circumstances arise when it would be very advantageous to have an inspector.

Regarding the payment of these inspectors, would suggest that the plan in use by American associations be adopted by the Canadian associations, should the matter be taken up.—The Pembroke Lumber Company, Pembroke, Ont.

Would Welcome a Change

Editor Canada Lumberman,—As a rule we have very little trouble over inspection of lumber received by consignee, but occasions sometimes develop whereby an independent inspector or arbitrator would certainly be an advantage to all concerned, in arranging an adjustment.

We would welcome and do our part for any change for the better that could be practically arranged. We would also be willing to pay our percentage toward maintaining such inspector or inspectors.—Muir, Terry & Gordon, Toronto.

North Western Grading System Used

Editor Canada Lumberman,—As our product is all shipped to the western market, we do not think the system that would be satisfactory to the eastern trade would work out here. At the present time we are grading our lumber according to the rules laid down by the Northwest Lumbermen's Association of Minnesota. We have no official inspection bureau.—Keewatin Lumber Company, Limited, Keewatin, Ont.

Satisfactory to all Branches of the Trade

Editor Canada Lumberman,—We consider the proposal of an official inspection bureau for the adjusting of disputes in regard to lumber shipments, a good idea.

We, ourselves, have very little trouble in regard to shipments, but consider that the establishment of a bureau of this kind would be satisfactory to all branches of the trade.—Booth & Shannon, Biscotasing, Ont.

Better for all Concerned

Editor Canada Lumberman,—We certainly think it would be a great deal better for all concerned in the business if a uniform system of grading and inspection of lumber were adopted, and competent inspectors appointed for the adjustment of all disputes about improper grading. Trussler Bros., Limited, Trout Creek, Ont.

A Step in the Right Direction

Editor Canada Lumberman,—I think it would be a step in the right direction to secure uniform grading and inspection of lumber. Mickle, Dyment & Son, Barrie, Ont., per S. Dyment.

A Side Issue of Importance

Editor Canada Lumberman,—Relevant to your campaign for uniform grades on Georgian Bay:

Why couldn't you undertake to form manufacturers of the North Shore of Georgian Bay into an association There are many things we are in need of up there that can be obtained only through an association. It is a point we are very lame on and decidedly behind times.

This section is the only unorganized section of lumber producers I know of. There are fifteen mills producing lumber in this section that admit allegiance to no association of any kind. By all means they should be combined for their mutual benefit. There are too many association advantages to be derived in this modern day not to belong to one.

You, as representative of Canadian lumber interests, are in a position equalled by none to bring to the attention of these manufacturers their weakness, form them into an association, and join to the Canadian Lumbermen's Association of Ottawa.

Don't deny our petition. Duty beckons you to take note of our benighted condition of suspicion and doubt, to set yourself at our head as our Moses and lead us from the wilderness.—White Pine Lumber Company, Detroit, Mich., per Daniel Wells.

Strongly Endorsed by Montreal Dealer

Mr. J. H. Poulin, secretary and sales manager of the Eagle Lumber Company, Limited, St. James Street, Montreal, in a conversation upon the question of grading and inspection of lumber, expressed himself as follows:—"Every progressive lumberman—I might even say every honest lumber dealer—should heartily support the agitation in favor of the most perfect and effective regulations possible to govern this important industry. It seems to me the abuses that have crept into the lumber trade are greater in number, and possibly in importance, than in almost any other trade, and the opportunities for disputes and fraudulent transactions are almost unlimited, as daily experience amply shows. I will admit that a great many of the disputes arise through the ignorance of measurers or graders, acting as clerks or yardmen, all the way from the manufacturer down to the contractor, but it is very well known by everybody in the trade that the present system, or rather lack of system, in the selling end of the business, leaves lots of room for suspicion and dishonesty.

"Let us have uniform terms and conditions under which to carry on our business; there will be plenty of room for competition in connection with the prices quoted and service rendered. Uniform grading and uniform dressing would save a lot of trouble. The terms 'mill run,' 'mill cull,' 'dead cull,' 'shipping cull,' and many other technical expressions, should be arbitrary, and specifications containing them should be lived up to, to the letter. There are supposed to be regulations in this city and province somewhat similar to those of the National Hardwood Lumber Association, but in many cases they are ignored and the conditions under which business is conducted to-day are simply shocking. I have met men who have been in the business for years who did not know the difference in grade between boards with one knot and three knots; or between a board with a crack a foot long or twenty inches long. They would not know the difference between a bunch of shingles or plank containing ten per cent sap and 30 per cent. sap, and so on. This is only to show how a man who is ever so honest may get a bad name through being incompetent or employing incompetent hands. First of all there needs to be an improvement in the technical knowledge of those handling lumber, and one of the best means of obtaining this knowledge is to use the rules of some such association as that above mentioned as a text book. This, in the hands of a practical man, would soon make him efficient. Until competent men are employed in this business, independent inspectors, who have passed satisfactory examinations should be appointed and should be available, the cost of their services being apportioned by mutual agreement when they are engaged; or, in case of dispute, the costs should fall on the party at fault. The inspector's rulings should be final.

"There is another point I would like to speak of while on this subject, and this is the practice some dealers have of varying their terms of sale for the purpose of buying business. It is customary to sell at two per cent. discount in thirty days, or on a three months' note, net. There are retailers with plenty of money in the bank, and quite able to meet their engagements, who will ask the wholesaler to wait for two or three weeks after the payment comes due. Anyone can figure out what the loss would amount to in the case of a dealer having from forty to sixty thousand dollars' worth of new business on his books every month. No firm could stand it, if it became a general practice, and no firm ought to permit their business to be carried on on such an unsound basis. It may as well be taken for granted that if a man allows these concessions to a customer he makes up the amount, and more, in some other way. Either he will charge a higher price, perhaps only a few cents per M, on the next shipment; or, there will be a shortage in the amount of goods delivered. There are men in business to-day so ignorant that they cannot see, or do not realize, that this is the most natural thing for the man they purchase from to do, and they are often too busy, too careless, or too lazy to check up their deliveries or compare their prices to find out how they are being dealt with. Perhaps they deserve no pity. But there is an important principle behind the whole transaction that is discreditable to the lumber trade from every point of view. It is not necessary to form a combine to put into practice honest and equitable business principles, and I do not consider that the man who gets business by bribery in the shape of unfair and unprofitable concessions is acting honestly with his brother tradesmen.

"Every lumber dealer knows how inconvenient it is to find variations in the lengths and thicknesses of the different pieces making up his stock. One paragraph in the general instructions in the National Hardwood Lumber Association reads as follows: 'Lumber showing greater variation in thickness than 1/16 of an inch at any point in stock cut one-half inch thick or less; or ⅛ inch in ⅝ or ¾ inch stock; or ¼ inch in one to two inch stock; or ⅜ inch in 2½ inch and thicker stock, must be measured at the thinnest part, classed as mis-sawn and graded and reported as such. Lumber showing no greater variation in thickness than allowed under this rule must be accepted and inspected into any of the grades of 'No. 3 common and better' to which its quality entitles it, and must be tallied at the standard thickness of the piece measured at its thinnest part.' Standard lengths, standard thicknesses, standard grades, and standard defects are all specifically given, and a fine is imposed if these specifications are not lived up to. For matched lumber a standard grading is even more important than for ordinary plain lumber. By all means let us have standard grading and inspection. One way of hastening the day when such regulations will become effective is for all who are in favor of it to insist on this grading and specify, accordingly, in connection with all their transactions.

"Perhaps an association composed of those favoring these regulations could be organized within the ranks of the lumber dealers all over the Dominion, and I do not know of any better service the Canada Lumberman could render the trade than to undertake the formation of such an association. I hope this agitation will be kept up persistently and produce better results than those that have previously been started; for, as a matter of fact, this is an old question, but it never needed settling worse than it does to-day."

Conditions in Quebec Deplorable

"Conditions in Ontario may be bad, as stated in recent issues of the Canada Lumberman, but they cannot be worse than they are in Quebec." This is the declaration of a dealer who is in as good a position to speak from experience as anyone in the trade. "There is lots of rascality in this business and our methods of carrying on our trade are so loose that there is no hope of improvement, and no way to ensure or enforce a better system until all hands join together in insisting on uniform regulations throughout the Dominion. It would be a pleasure to do business under such conditions as obtain where dealers voluntarily come under specified rules and work in harmony, but where different men in the same business are at sixes and sevens with regard to business methods it cannot but be unpleasant for all concerned. There is no nonsense in the way business is carried on where such rules are in force as those formulated and enjoined by certain large lumber associations in the United States. Why anyone should object to the adoption of uniform rules for business of this kind is beyond my comprehension. Not only are such regulations not observed in this part of the country, but to make matters worse there is not even an official measurer, much less competent and independent inspectors. I consider this agitation most timely and wish the Canada Lumberman early and complete success in its efforts to have proper regulations adopted throughout Canada."

A Note of Opposition

A Montreal lumber dealer of wide experience, speaking of grading and inspection of lumber, to a representative of the Canada Lumberman, said he did not altogether agree with the arguments put forth in favor of an inspection bureau and a rigid grading system. He was of the opinion that it was not the wholesalers who were at fault, but that agents or middlemen, trading on commission, were the most to blame for irregularities and unsatisfactory dealings in the lumber business. For his own part he regularly visited the yards of the manufacturers and saw for himself what he was buying. It was a bona fide transaction and the lumber became his property as soon as the deal was put through. His customers did not have to go back of him with any complaints. He had very little trouble in properly describing what he had to sell and very few claims for either shortages or inferiority in the goods sold. If all wholesale dealers knew their business thoroughly and wished to act in a straightforward manner he considered the present regulations sufficient for the transaction of business in an entirely satisfactory manner.

An Analysis of the Shingle Situation

The following article was written by a prominent association offical in reply to a request from the west coast as to what the eastern retail lumber market demands in the packing and sale of red cedar shingles:

I am not aware of any change in the rules for the packing of shingles since the year one, or more properly "two." Originally Virginia cypress shingles were packed in round bunches of forty to fifty pieces, wrapped with hickory withe, under the rule that a thousand shingles, 4 inches wide, ½ inch butt and 18 to 36 inches long, were to be reckoned as one thousand. Everything was breasted (shaved) until about 1845 when for a few years cut shingles were in vogue (block steamed and sliced) and these were put up in 24-inch bands (tied with hickory withes or tarred rope), 20 courses, with two extra shingles on top, counting 4 inches to the shingle. (For many years after Dismal Swamp cypress snakes went out of fashion, shingles were packed in bunches of 500.) When I became a clerk in my father's yard in 1847 we began to get sawed hemlock shingles from the Adirondacks, a great curiosity because they were sawed 16-inch and put up in four bunches of twenty-five courses, each side, 22-inch bands which stuck over an inch on each end and tied with marlin, making the shingles 20 inches, or five shingles to the course, four bunches to the thousand. Soon after iron bands were adopted to secure 20-inch sticks, giving the full measure of the shingles. Of late a custom has arisen of 19-inch bands, 50 courses, netting 948 shingles to four bunches, a shortage of 52 shingles, or 5 2-10 per cent. Under present rules

> "To be packed when green in regulation 20-inch packing frame (not bands), 25 courses to the bunch (each end), with not to exceed 1½ inches open space to the course."

We have, if (as is sometimes the case) advantage is taken of the technical point, openings of 75 inches, or 18¾ 4-inch shingles, making a total shortage of 70¾ shingles on the 1,000, or nearly 8 per cent. lacking in my purchase of 1,000 shingles, or $2.75 worth of shingles which I received upon my contract for $3.00 worth of shingles. Now if I must allow not to exceed 5 per cent. degrade in quality under the rules, I have actually only $2.60 for my $3.

A "Thousand" Means Ten Hundred

From the earliest development of mathematics, a capital C has always stood for 100; V for 500, and M for 1,000. How my friend Stine can make out that M signifies four bunches and not 1,000 when used in connection with shingles, I am at a loss to determine. I was taught when I first began to handle lumber and shingles sixty-four years ago that the use of M was but an abbreviation to save time and ink in writing out the word "thousand." It was not until coast shippers instituted the fraud of short count that the discovery was made that 930 was equal to 1,000. Honest trade and old time arithmetic demand that a thousand clear shingles shall consist of (wider or narrower) the equivalent of 1,000 pieces of 4 inches.

"Clear" Means Only One Thing

Speaking of "Clear," there is but one word in the lumbering lexicon by which it can be defined, that is "Perfect," which, further defined, means "free from all defects." What a misnomer then is the brand of "Extra" clear. In olden days lumber was defined as "Clear, Fourths and Common" and the Clears subdivided into first, Second and Third, signifying one, two or three small defects and were a qualification only of the generic term "Clear," and priced accordingly; but in shingles the term Clear can have but one significance, viz.: "Perfect," and if I buy a thousand shingles of the brand "Clear" I am entitled by right to a thousand 4-inch pieces (or their equivalent) which are well manufactured and free from any defent or knot, rot, shake or worm hole. But I don't get what I bargain for in ninety-nine cases out of a hundred; and just in proportion as they contain defects my customer grumbles and demands a rebate and I grumble at the man who sold them to me and demand that he make good to me that which I must make good to my customer, or what I must concede in the price of my shingles if I would keep my customer.

Willing to Pay the Price

Now; I have never known a dealer who was not willing to pay the going price for reliable goods. I can cite you a mill in Canada which has buyers for all the shingles it can manufacture at an advance of 30 cents to 50 cents a thousand over the coast prices, because its brand is a guaranty of quality and count. The "Purple" brand has lost its significance because the manufacturers from the first discounted and, while I believe the inspectors of the association have tried to do their duty, yet it is apparent that so soon as the inspector's back was turned the packers "played smart." It has been a question in my mind if there was not a certain class of brokers who could make more money out of a degrade car than out of one which had no complaints connected with it. I hope I am wrong. Perhaps it is the manufacturer who wrings his own neck by his careless supervision, through which the packer takes license to stick in a certain quantity more or less which he should reject and which damns the brand when the purchaser gets hold of them, and posibly increases the profit of the broker who adjusts the rebate. If you had a law in your state defining the several qualities (you should have but two), and making it finable to degrade the brand, your shingles would at once sell for 50 cents above present quotations and your packers would adopt the motto: "Not how many I can pack, but how good I can make them."

Now a word as to openings. I do not know a retailer who would object to reasonable openings, as widths of your shingles compel an occasional even to 1½ inch; but put yourself in the place of a farmer who would walk or drive ten miles to get an extra 2 cents a dozen on threen dozen eggs and see if you would not refuse to "buy the air" comprises 5 to 10 per cent. of some bunches which you have seen and which I have seen. The remedy for this is in instructing the knot sawyer to split one occasionally so that the packer can have some fillers. Shingles of 5 to 9 inches are vastly preferable to those of even 12 inches, while an occasional four or ever 3 inch filler will occasion no comment, while a number of 2-inch will condemn the bunch.

If the coast manufacturers would hold a two or three-day congress and discuss conditions of manufacture, packing and selling and educate themselves and their men to existing conditions and the remedy for the "every man for himself" policy now existing, they would soon revolutionize the shingle business and make a profit out of it. But so long as they try to outwit the ultimate buyer through false brands and each other by agreements they do not expect or intend to live up to, they may shout "Peace" until doomsday but will have no peace. Settled rules of grade and strict adherence to business principles will alone bring the trade a much needed prosperity and that can be obtained as soon as the manufacturers are ready to vote fair with each other and the consuming public.—The Lumber World.

Comparative figures show that last year's shipment from Spokane to British Columbia points totalled 12,000,000 feet, as against a similar amount for the past six months of 1911. In 1909 Canada demanded only 3,000,000 feet of Washington and Idaho pine, and previous to that time there was no Canadian business for United States Lumbermen.

Wanted at Once—a Forest Fire Brigade

Experienced Woodsmen Can Alone Save Our Forests From Great Conflagrations—Timely Proposals From One Who Knows

By "Bushranger"

As a sequel to the recent terrible holocaust in the Temiskaming region there has followed the usual crop of protests in the daily press concerning the criminal inadequacy of the arrangements for the protection of our forests from fire. The same thing happens every year; bush fires devastate huge tracts of valuable timber land on this continent, claiming each time a certain quota of human life, large or small, according to the circumstances; then follows a howl of indignation in the newspapers, together with a variety of suggestions, some practicable, and others utterly unpracticable, but when the first painful sensation has died away (as it generally does in a few days) the whole question is allowed to drop out of mind, only to be revived when another fire horror shocks public sentiment a year later. The conflagration which wiped Porcupine and Cochrane off the map, and piled up a death toll more appalling probably than any which has occurred in the history of the Canadian bush, may not be so easily forgotten; and, disastrous as it was, if it only serves to make the question a live issue which will be kept prominently before the public until much needed reforms, which will tend to prevent the recurrence of such a calamity, have been effected, then the terrible loss of life will not have been altogether in vain.

That the present system of fire ranging is, generally speaking, farcical and useless, is apparent to anyone acquainted with the bush; that the appointment of old men or weak, unqualified youths to positions as fire rangers, for no other reasons than those of political pull, is fraught not only with evil, but absolute danger to the community, is equally obvious. Go to any district where railroad construction is in progress and for one fire ranger in any way competent to perform his duties, you will find a dozen incompetents, with neither the strength, the energy nor the will to cope thoroughly with even an insignificant conflagration. The practice of appointing college students, whose fathers or other relations have some pull with either the government or the sitting member has become a good deal too common and amounts to little short of a scandal. They enter upon their duties not with any intention of making them a serious business, but with the sole idea of enjoying an idle but remunerative summer holiday. The lazy life which they lead is a bad thing for them as well as for the community, for they acquire habits of indolence, untidiness, and general neglect of themselves and their immediate surroundings which will be a serious drawback to them in any career they may enter upon in after years. Ask anyone who is brought into daily contact with these young fellows and he will tell you that for days together they hardly stir outside their little shacks; and when the weather is hottest, and the danger from fire proportionately great, they show less inclination than ever to go their daily round.

"It's too hot to go. Anyhow there's sure to be nothing doing. There seldom is," is the way they satisy their consciences. Even when a small fire is reported to them they cannot be depended upon to go out and attend to it. As summer creeps on towards autumn they become more and more lazy until at length the task even of cooking their meals, or cleaning out their little cabins, becomes a painful effort.

This may seem a sweeping indictment of fire rangers generally, but that it is absolutely true of many of them can be corroborated by plenty of incontrovertible testimony. And after all it is not so much the men as the system which is at fault. They are sent to perform duties of which they are entirely ignorant; they are committed to a life of lonliness for which their town or city training has entirely unfitted them; and their duties are not sufficiently onerous to keep them occupied either in body or mind. It is the proverbial case of trying to fit a round plug into a square hole. There are exceptions to this as to every other rule. Even along the lines of railway construction are to be found rangers who conscientiously carry out their duties; whilst on the timber limits the owners are usually careful to see that the men cover their beats at specified intervals.

The very first thing to be done in effecting a reform in the system of forest protection is to eliminate political "pull" from the appointment of fire rangers. As long as politics enter into the question there will never be efficiency. Human life—to say nothing of the heavy commercial loss which a big bush fire entails—is too precious a thing to be sacrificed to the mere whim of party patronage.

The only men really qualified to act as fire rangers are experienced bushmen—men who know the bush as a sailor knows the sea, and who from actual experience, perchance, realize the dire results which may follow from an incipient bush fire. They are accustomed to the loneliness of the forest; they can, in various ways, find plenty to occupy their time during the long summer days, and so guard against the indolence and inertia which the town-bred ranger is too prone to develop. Moreover, when an emergency arises they can wield an axe to the best advantage; and can undergo the necescary hard manual labor without the exhaustion which would soon overcome many of the present holders of the position.

With an efficient body of fire rangers composed entirely of trained bushmen, much could be done to stop many bush fires at their inception; but something more is necessary. One or two men are absolutely helpless to cope with anything like a big conflagration when it has once taken serious hold; and the question offers itself whether it would not be possible to oragnize a properly trained brigade of forest fire fighters, divided into small corps to be located in towns in lumbering centres, ready to be despatched to any dangerous outbreak when it occurs. The Toronto daily papers of Thursday, July 6, contained an interview with Mr. J. L. Englehart, chairman of the Temiskaming & Northern Ontario Railway Commission, who had returned from a trip over the railroad on the previous day, telling of serious fires which were raging along the line and in the Porcupine district during his visit. It must have been on Tuesday, July 4, that Mr. Englehart saw these conflagations, yet it was not until Tuesday, July 11—a week later—that Porcupine and Cochrane were destroyed, the primary cause being probably the fires which Mr. Englehart had seen. Apparently no vigorous steps were taken to quell the outbreak, or to minimize the danger during the week they were burning. Had there been a properly equipped brigade, stationed, say, at North Bay, it could have been despatched to the scene, by special train or otherwise, on Tuesday, July 4, and possibly a large timber area might have been saved from destruction, and certainly something might have been done to put adjacent towns out of jeopardy.

If such a brigade were brought into existence it would be possible to have "reservists" in the lumber districts ready to be called upon at short notice. Many of the men who spend the winter in the shanties work in the towns and on farms in the surrounding district in the summer months; and for a moderate retaining fee they would no doubt be willing to join a reserve corps of bush-fire-fighters, to be called upon to serve in case of necessity. The services of these men would be invaluable if they could be rushed with promptitude to a dangerous outbreak. For the days they were on duty they would of course be paid a fair rate of wages, in addition to their retaining fee.

Among the foremen of the lumber shanties might be found many men thoroughly capable of filling the position of chief of such a brigade—men who not only are accustomed to handle large gangs of men, but whose hearts are in the bush, and who would make a study of the best methods of fighting forest fires. In this way the science of suppressing bush fires would be developed and in the course of time Canadians would have as much reason to be proud of their brigade of forest fire fighters as they are of their North-West Mounted Police and the other brave men who face danger, hardship and privation in the vast and lonely wilds of the Dominion.

Why should not the Ontario Government take the matter in hand and set the example to other provinces? To carry out the project would involve an expenditure of money by no means extravagant when one takes into consideration the enormous loss involved annually by forest fires, to say nothing of the yearly toll of human life.

The Quebec provincial government has decided to send out two expeditions for the purpose of exploring and classifying the timber areas along the line of the Grand Trunk Pacific and also further north. The expeditions will also keep an eye open for the presence of any minerals, but their real object is to determine the resources of the northern part of the province. With the opening of the Transcontinental railway large areas of timber lands, hitherto inaccessiblle, will be brought within reach of lumbering operations, and it is to determine the extent and value of these timber lands that these expeditions are being sent out. During recent years this province has taken many forward steps in all matters relating to its timber lands and pulp areas and this latest move is in keeping with its general policy.

Riordan Sawmill at Calumet, Destroyed by Fire

The large sawmill of the Riordon Paper Company, at Calumet, Que., on the Ottawa River, formerly known as the Perley mill, was completely destroyed by fire on Wednesday, July 12th. The fire was first noticed coming from beneath the band saw and despite immediate action, so quickly did the flames spread that men had to jump from the second storey window, and those fighting the fire had to run for their lives. A high wind quickly communicated the flames to the adjoining buildings, the office and the many lumber piles, as well as the workmen's cottages. Two barges just loaded at the wharf narrowly escaped burning; their lines were cut and the boats set adrift, afterwards being picked up by the tug Glide.

The fire started about 10.30 o'clock in the morning, and nothing could have prevented the destruction wrought. The west yard and the north yard, containing clap board warehouses and slabs and shingles, were not wholly destroyed. The lumber burned was largely spruce. Roughly estimated the loss was $150,000 to $175,000, which was adequately covered by insurance. The company will rebuild as soon as the conditions permit.

This company also have mills at L'Annunciation, Boule and Quoinelle, on the Laurentian branch of the Canadian Pacific Railway, unaffected by the fire.

A fire steamer, hose wagon and ten firemen were sent up from Montreal in the afternoon and prevented the flames spreading to the lumber not already burned. They continued pumping water for twenty-four hours until all danger from further damage had passed.

Some two hundred men were thrown out of work and a number of their dwellings burned, but the men have since found employment with the company at other points and in neighboring mills, till the Riordon mill is rebuilt.

All Records Broken in Canada's Building Progress

The building statistics for twenty-six of the leading cities of Canada for the first six months of the year 1911 show that there has been an increase in the expenditure upon building amounting to some $15,000,000, as compared with the corresponding period in 1910. This is a remarkably good showing when it is remembered that the building record for the first six months of 1910 broke all previous records. Following are the details:—

Town or City	June, 1910	June, 1911	1st 6 mos. 1910	1st 6 mos. 1911	Approx. inc. % for 6 months
Toronto	$2,302,550	$2,384,400	$9,820,648	$11,939,953	22
Vancouver	1,162,940	906,706	6,885,880	9,188,406	33
Winnipeg	2,413,700	2,790,250	9,906,100	8,581,550	13*
Calgary	573,486	1,826,220	2,394,942	8,212,248	242
Montreal	1,585,254	1,780,860	7,126,880	7,305,816	2
Regina	255,318	716,025	1,342,003	2,936,930	111
Saskatoon	194,400	779,725	1,657,131	2,575,441	55
Hamilton	301,885	618,675	1,232,725	2,246,657	82
Edmonton	233,670	357,929	1,054,476	1,620,431	54
Victoria	227,600	250,800	1,202,835	1,432,585	19
Ottawa	302,000	404,975	1,690,025	1,393,370	12*
Moose Jaw	83,190	665,300	513,210	1,295,575	154
Brandon	98,950	30,725	401,700	803,574	101
Sherbrooke	150,000	350,000	300,000	675,000	125
Fort William	256,225	220,390	939,280	750,075	20*
Lethbridge	91,005	94,960	659,570	485,625	26*
London	38,586	44,756	452,466	458,423	1
Windsor	31,075	126,330	109,480	395,495	261
Port Arthur	65,375	183,450	310,465	315,660	2
Sydney, N.S.	69,789	98,247	204,652	382,052	87
Halifax	21,630	52,000	176,450	211,150	20
Strathcona	13,450	127,323	234,500	214,183	9*
St. John, N.B.	44,300	62,000	222,000	211,700	5*
St. Thomas	31,050	23,300	112,850	136,150	21
Kingston	11,545	58,125	100,143	136,462	36
Stratford	33,500	12,400	190,000	62,500	67*
	$10,592,573	$14,965,871	$49,240,411	$64,068,029	30

Increase for first six months of 1911 is 30 per cent.

*Decrease

Cooperage Trade Improving

The Sutherland-Innes Company, Chatham, Ont., report as follows:—The demand for cooperage stock is still increasing, and prices are advancing all along the line, even staves are now feeling the effect of the increased business and the diminished production, and buyers are willing to pay better prices than they have for some time.

The production of hoops has been very light for some time, and the consequence is, the market is bare, and prices have advanced to a point where iron hoops are going to be used to a considerable extent; it is only a question of time when these will supplant the wooden hoop entirely, as hoop timber is getting so much scarcer every year, and is much more valuable for other purposes than being put into hoops.

No. 2 staves are now moving freely, and stocks at the mills are pretty well cleaned out. There is considerable demand for apple barrel stock, as the prospects for a fruit crop, while not as good as expected, still there is going to be a very fair crop, if nothing unforeseen happens between now and the time when the apples will be ready for packing.

Business throughout the country continues to improve, and, as there have never been better prospects for excellent crops throughout the country, we see no reason why this year should not be a banner year in the cooperage industry.

Gatineau Declared a Floatable Stream

By a decision of the court of appeals in Montreal the Gatineau river, which empties into the Ottawa river at Hull, is declared a floatable stream, and consequently owned by the provincial government. The case arose from the sale of the banks and bed of the Gatineau river and the water at Paugan Falls, Low township, by the Quebec government to Hanson Bros., of Montreal, in 1907. MacLaren Bros. owned the land on both sides of the river and took action to set aside the sale on the ground that the rights of the river belonged to them on the basis of riparian rights. The attorney-general for Quebec intervened to support the original sale. The case hinged on an article of the Quebec civil code which declares that the banks and beds of navigable and floatable streams belong to the Crown. Both parties agreed that the river was not navigable. The MacLaren interests claimed it was not floatable either. A decision of the superior court of Hull sustained them in that contention. However, the Court of Appeals in Montreal completely reversed the subordinate court's decision. The case was decided in favor of the province on the ground that a river down which came so many million feet of timber every year must be floatable. The contest may yet be carried to the Supreme Court of Canada and to the Privy Council in England.

Engineer Gets Damages

A special jury in the case of Latham vs. the Heaps Lumber Company, heard in Supreme Court, at Vancouver, before Mr. Justice Clement, awarded a verdict in favor of the plaintiff for $3,000. Latham was employed as engineer of a stationary engine at the defendant company's camp at Narrows Arm, and while at work on November 4 last was injured. The accident, he claimed, was due to the faulty framework of the engine and also to the alleged fact that the engine did not contain any safety clamp or guard. For this he brought action against the Heaps Lumber Company claiming $15,000 damages, or in the alternative such damages as the jury saw fit to award under the Employers' Liability Act.

Personal News and Notes

Lumberman to be Manitoba's Lieutenant-Governor

The announcement is made from Winnipeg that Mr. D. C. Cameron, the well-known lumberman, head of the Rat Portage Lumber Company, is to be appointed to the important position of Lieutenant-Governor of the Province of Manitoba. The lumber trade and industry in Canada will join in offering their heartiest congratulations to Mr. Cameron, and will feel that in the honor which has been bestowed upon him, the lumber industry has itself been honored greatly.

In addition to his interest in numerous successful lumbering enterprises, Mr. Cameron has always taken the liveliest interest in public affairs. In 1891 he was elected to the town council of Rat Portage, and nine years later became Mayor, a position which he occupied during the three years of 1901-2 and 3. He was elected to the Ontario Legislature, as a supporter of the Liberal government, in 1902, and during his political career was one of the most active politicians in the legislature.

Mr. Cameron was born in Vankleek Hill, Prescott County, Ontario, in 1855. He first went to the Canadian West by the arduous routes of the early days, and reached Brandon in 1878. Shortly afterwards he returned to his home in Ontario, and again went west in 1880, living in Winnipeg for a year and a half. In 1881 he moved to Brandon, where he resided for two years, carrying on the work of a contractor, and constructing a number of the local improvements of the town. He built the first sawmill in Brandon, and in 1883 he again moved, this time to Rat Portage, where he went into the lumbering business extensively. From that time to the present his lumber interests have continually increased, until to-day he is one of the largest operators in Canada, and has built up a reputation for himself in the lumber industry which is unexcelled. Later Mr. Cameron moved to Winnipeg, where he was better able to direct the business affairs of his numerous enterprises.

In addition to his lumber interests, Mr. Cameron is closely connected with the milling industry and the banking business of the Canadian West. His lumbering interests are not confined to Rat Portage, and Winnipeg, but extend to the Pacific Coast, where his company operate extensive mills, and occupy one of the most prominent positions in the lumber industry of that province.

A. C. Dutton Increases His Holdings

A. C. Dutton, of Springfield, Mass., has bought out the interests of John Fenderson in John Fenderson and Company, Inc., large operators in Canadian lumber along the line of the Intercolonial railroad, which include saw and planing mill plants at Sayabec, P.Q., saw mills at Salmon Lake, St. Moise, Cedar Hall and other smaller operations, as well as that of the Louison Lumber Company, at Jacquet River. Mr. Fenderson will, however, retain a small interest in the latter operation. The officers of the company will now include Arthur C. Dutton, as president, secretary and treasurer, with Charles L. Fenderson, a son of John Fenderson, as vice-president. C. L. Fenderson has general charge of the woods operations and mills, and makes his headquarters at Jacquet River. This is a Quebec corporation, and all of the product of this chain of mills is handled by the A. C. Dutton Lumber Company, wholesalers, at Springfield, Mass.

Mr. A. H. D. Ross in the West

Mr. A. H. D. Ross, of the Faculty of Forestry, University of Toronto, is spending the summer in British Columbia, with ten of his students, conducting forestry investigations for the Canadian Pacific Railway. Mr. Ross attended the recent congress of the Pacific Coast Loggers' Association, and reports that it was one of the most successful and well managed conventions he ever attended.

Must Be a Million

The attendance at the Canadian National Exhibition in Toronto is jumping at the rate of 100,000 a year. In 1909 it was 750,000; in 1910, despite the unfavorable weather, it was 837,000. This year only continued wet weather can keep it from reaching the million mark.

The Census and Statistics Office of Canada have issued a report under date of July 13, stating that the condition of the field crops of Canada for the month ending June 30 was on the whole quite satisfactory, although on account of uneven rainfall it was not uniform for all the provinces. In Ontario the condition of the crops was not at all uniform, but from most parts of the province excellent reports were made. The condition of winter wheat was only 75.62 per cent, of a full crop, which is 10 per cent. less than last year, two per cent. less than 1909, and nearly 14 per cent. less than four years ago. In Ontario it was only 73 per cent. of a full crop, as compared with 94.29 per cent. last year, 78.60 per cent. in 1909, and 88 per cent. in 1908.

Items of Interest from the East

The annual sale of no mark logs and mixed logs was conducted on July 19 in the board of trade rooms, St. John, N.B., by the St. John River Log Driving Company. Good prices were obtained for most of the lumber.

The greatest quantity sold was in spruce which brought $14.50. The purchasers were the E. Partington Company. The figures given were as follows:—

No mark logs, 231,803 merchantable, 281,148; battens, and 101,008, condemned.

Mixed (five hacks) logs, 44,342, merchantable, 106,308 battens, and 4,962 condemned.

The bidding in cedar and pine was brisk, and much interest was shown. The no mark cedar 79,640 feet, and 14,190 of mixed marks, started at $4 and sold at $9.40 to Stetson, Cutler & Company; Hilyard Bros. got the pine, no mark, at $10.25. In this 11,680 mixed mark sold at $10.25. In this case the first bid was $7.

A lot of hardwood, comprising 5,977 feet, went to Warner & Company, at $6. The York Sunbury Company secured 42,400 feet of hemlock at $7.50. Of this 17,400 was no mark and the balance marked.

A peculiar accident happened recently to some employees of the Shives Lumber Company, of Campbellton, N.B. The company scow their lumber from about a hundred miles up the river to their mill at Campbellton. Three horses, each carrying a rider, tow these scows, the horses and the riders being in the water all the time. Early in July, while a party was coming down the river a terrible storm took place. A bolt of lightning struck the party and killed the three horses and riders instantaneously.

It is estimated by J. Fraser Gregory, president of the St. John Log Driving Company, that there will be upward of 100,000,000 feet of logs to drive this season on the St. John, including 30,000,000 feet hung up last year. The lumber cut of the Amherst district of Nova Scotia is reported to total 80,000,000 feet, the largest in a number of years.

Serious forest fires are reported from the Shulie district in Nova Scotia. Among those who are reported to have suffered loss are the Robinson Wright Company, C. L. White & Son, the Fox River Lumber Company, and the Elderkin Company. Latest reports were that the fire extended from River Herbert almost to Parrsboro. Up to that time no mills had been destroyed.

Unsettled Trade at Liverpool

Messrs. Smith & Tyrer, Liverpool, Eng., in their report upon the timber trade for June, write as follows:—

We have experienced a very unsettled month in this country on account of the Whitsuntide holidays, the Coronation holidays, and finally the deplorable strike among the seamen and dock workers. This strike is still going on, and business is, as a result, conducted with difficulty, the transport of goods from or to the vessels being almost an impossibility. Pitch pine: Hewn timber is in small demand. Sawn values have weakened as sellers have shown more eagerness to sell, and only a poor enquiry has been experienced. Moreover, in some centres the markets have been demoralized by consignments and parcels are reported to have been sacrificed at very low figures. Prime lumber is better on the Continent but in poor demand in this country. Lower qualities have come forward freely on consignment and more than satisfied the markets. U. S. A. Hardwoods.—There has been some revival but not great activity. Spruce deals continue on about the same level of value, with perhaps a little stronger feeling on account of the reports of drought. There is some fear that the fall supplies are likely to prove excessive. The firmness of freights should help to sustain prices. Birch continues in good demand, both for logs and planks, but the position is now easier. Pine deals.—Lower ports have been difficult to sell, and low prices have been taken. Hemlock.—There is little or no enquiry.

Japanese are reported to have been trespassing on British Columbia Crown lands and cutting timber thereon. The government has sent a patrol launch to investigate and hopes to put an end to the practice.

The Retail Dealer and His Problems

Classification of Lumber—A Suggested Revolution

A Problem for the Future

One of the established facts in the retail lumber business to-day is the necessity for carrying in stock several different kinds of lumber, thereby increasing the amount of capital necessary to operate a yard. In hardly any section of the country is the retailer exempt from this change in the business. Many young men who have started in business during the past ten years don't know any differently because they have not had the experience of the older dealers in the handling of but one kind of lumber as a stock. Therefore they have come into the business and inherited many of the ideas and prejudiced opinions of those they learned the business from.

We of the older generation started in with the white pine as being the only wood that was being used for lumber. We knew no other lumber for a number of years. But in time the change came. The southern forests were opened as a new source of supply. Then came the completion of the transcontinental lines and the consequent competition of the products of the coast forests, and also those of the "Inland Empire." Mingling with these are the hemlock, Norway, spruce and tamarack, and what is left of the white pine, from the forests of the north. Also cypress and gum have developed into use and the former, being extensively advertised, as it is, is fast making it necessary for an increasing number of dealers to handle it.

In some sections of the country there are practically three stocks of lumber carried in some of the larger yards, and scarcely any yard but what has two stocks and a smattering of other woods besides. If the manufacturers of the Pacific coast and of the "Inland Empire" take it into their heads to follow the cypress people and inaugurate a campaign of advertising their products there will be more yards than there are now carrying a greater diversity in their stocks. It is the competition of these producing sections in prices that is responsible for many a dealer having to carry more than the one stock, and it will be worse for him when this scheme of advertising begins to get in its work on the public mind. If this materializes, as is expected, I can see the future retail yard a good deal bigger than it is now, and I think you will agree with me that the idea is a logical one. But this is a bridge that we won't have to cross for some time yet.

Mistakes of the Retailers

For many years I have entertained the theory that retail lumbermen have gone on making the mistake of differentiating too much between the various kinds of lumber in their stocks. It has become such a fixed habit with them that they are not aware of the tendency of making the distinction. I remember when the low price of yellow pine compelled us against our wills to buy it and make it a part of our stock. We looked on the stranger as an interloper and inferior to the good white pine everybody was familiar with. So we piled it separately as a distinctive class of lumber, and for sale to those who were looking for low prices rather than quality. It was our "fighting stock" where we had to figure close on bills to get them. Many a bill I have lost that the "other fellow" figured in the new kind of pine where I had figured on the white pine that was specified in the bill, and it was not long before I got on to the same game myself. In course of time yellow pine became an established fact, and for a number of years our customers had their choice between the pine of the northern and southern forests. Carpenters soon learned to make the distinction in specifying the items in their bills. Not until we almost ceased to carry white pine common lumber did they specify anything else, and they were reluctant to the last to accept the yellow pine as a substitute.

For a little while hemlock made its way, and for a year or two a good deal of it was used because of its cheapness in price. Of course we piled that separate also, and it took the place of yellow pine as a "fighting stock." During all this time, however, I was still carrying a small stock of white pine for some who wouldn't look at anything else and were willing to pay the price.

We had no more than got settled down to using the substitutes for the northern pine than we were being called on by the salesmen of the coast products, and again were we tempted by the quality and prices of red cedar, redwood, spruce and fir, and later on, the white pine and larch.

So, during the past twenty years it has been almost a constant succession of new and unknown woods that have been forced upon the retail lumbermen to introduce and educate the consumer to use. Never again in this country will the lumbermen have such an experience. They have made history and established precedents for the future generations of dealers. The young man entering the business to-day will never have the peculiar experience of his predecessors in the introduction and the trying out of a new and unknown kind of lumber. He will never know what it is to combat the prejudices of men who have been accustomed to the use of one kind of lumber all their lives. The old carpenters and the old farmers that used to get a good percentage of selects in the common boards and fencing they bought will have passed away to bother the retailer no more. The status and value of the different kinds of lumber have become established for him. He will have his problems to solve though that are sure to develop from ever changing conditions in the economics of the country.

The Pendulum Will Swing Back

I believe that sooner or later there will be a movement in the direction of lessening the burden of expense in the carrying of the diversified and mixed stocks that will no doubt be an even more general feature of retail yards than it is to-day, and this movement will have to be begun by the retail lumbermen themselves and carried out by a concerted effort. Before I explain my idea about this movement let me give you in brief my reasons for it, and I believe you will see them clearly when I call your attention to a few facts that you see every day in your lumber yard.

Some of you have in stock two or three kinds of siding, as many of flooring, ceiling and ship lap, and at least two kinds of drop siding. In addition, perhaps, you have several grades of all these kinds. The same diversity probably is in your dimension and common boards, and they all come under the head and are denominated as lumber. Now take any intelligent man in your town—not a lumberman of course—up and down the residence streets and ask him what kinds of lumber these houses are built of. They are all painted and similar in appearance. What answer will he make, and what can he honestly make, but the one, "I don't know." I'll warrant that a number of lumber dealers from the country may come into this place, and, standing on the sidewalk, scarcely one of them will be able to tell accurately what kind of lumber is in the construction of the house he sees. We are more and more realizing the fact that it makes little difference, if any, what kind of wood goes into the construction of our buildings. Everything on the outside is covered with paint except the shingles, and the plastering covers all the woodwork within but the floors and the openings. If hemlock is the cheapest, then hemlock is used, and the same may be said of yellow pine. The law of prices rules in the country as in the city. Now the movement I have referred to is this:

If manufacturers of the different producing sections could be induced to adopt a uniformity among them of making all dimension of the same size, the boards of the same thickness, and the same matching, so that lumber from the different sections could be used in the same construction, then there would be no necessity for the retailers to pile every kind by itself and practically carry two or three stocks in his yard. He could put yellow pine and fir, or any other dimension all in the same pile, and the same could be done with common boards, shiplap and drop siding and common flooring. The two latter items, being of the same width and matching, could be piled together no matter what kind of wood they were made of, and when used and covered with paint, as in the case with drop siding, the distinction of kind would be obliterated and the owner himself would soon forget his objections, if he had any.

The Mixing of Woods

This mixing of woods is gradually becoming more common in many of the items of stock in a lumber yard. There are stock doors now with yellow pine panels and the stiles and rails of western pine or any other pine that is lowest in the market. When these two different woods are finished with stain or paint no one thinks even of his prejudice for or against either of them. The average molding rack in a yard nowadays contains moldings made from several different kinds of wood, but the dealer never thinks of separating them and putting them in their several spaces. Of course, there are many items in a mixed stock which have to be piled separately and sold that way. The floors in a house nowadays are finished in the natural wood color, and the same with the inside trimmings of doors and windows. But these items are a comparatively small part of the general stock.

Uniformity the Great Need

The great need, however, is a uniformity in the manufacture of lumber, especially is this so with the products of the mills on the Pacific coast. Take the two items, for instance, of red cedar and spruce bevel siding. The difference in their manufacture is such as to prevent any possibility of their interchange in use on the same wall of a building. Now, if they were identical in width and thickness, don't you see how it would many times work to the advantage of the dealer? He could pile them together for one thing. Then again if he ran short of red cedar he could send out spruce to fill out the balance of the bill, and, as I have said before, when the building was painted, who would know the difference? Don't it look absurd, and bordering on the ridiculous, for a dealer to have thousands of feet of spruce siding in his stock, and then have to go out and buy of his neighbor some red cedar that has been specified in a bill he has sold and which some crank of a carpenter insists on having because it was so specified in the bill?

The average contractor thinks that when a dealer wants to furnish a substitute for something he has agreed to furnish he does so because it is to his advantage and profit. In the great majority of instances the owner of a building does not care, because he cannot distinguish between the different kinds of lumber. He leaves it largely with his contractor to say what it shall be, and the contractor is governed in his specifying what the terms shall be by his likes or dislikes in using them. If he has become accustomed to using spruce siding, he will specify it in the bill he is making out for his customer, and he will do this with any other kind, as the case may be, with his use of them. When you come to think out the reason for this, it will be found that the retailers themselves are largely to blame for all this sort of thing. They began, themselves, to make the distinctions between the different kinds of lumber. They are doing it right along to-day in their every-day business, and they have done this so long that they do it unconsciously. Just for instance, keep tab on yourself for a few days and see how often you will ask a customer what kind of lumber he wants. You may have three kinds of dimension. To please him, you give him his choice, and all he knows of them, perhaps is their names. If you are short in the number and lengths of certain items you naturally will try to sell him what you have the most of. Otherwise you will give him what he asks for.

The Particular Farmer

I know what you will say when reading this. You will want to ask me: What if a farmer wants a certain kind of dimension because of its greater strength for a particular purpose? In a farmer's trade, the strength of stuff is an essential point with him, and there are some purposes he wants lumber for that he is justified in complaining of the small size of the piece stuff commonly used. For several years before I left the country yard, I kept a small assortment of inch and two-inch rough common in stock. I knew pretty well the few sizes especially needed for farm purposes. I had customers that were only too glad to get them and paid the extra price without any grumbling. A difference of $5 on a thousand adds only a trifle to the cost of a few 2 x 4's. I used to sell several hundred 2 x 4-16's, rough, during the year and I have known of farmers driving from the territory of other towns to get a few of them, or of the 12-inch rough common that I also had in stock. It was one of my most effective advertisements. But, mind you, I didn't sell this class of stock at so much per thousand. I sold it by the piece and so much for a board and varied the prices according to their quality, in other words, I charged for the selecting if any was done. I was many years in the trade though before I had accumulated a degree of honor to charge a man extra for selecting stuff to suit him. But, most any dealer of sense will come to it after awhile.

Referring back again to the subject of mixed stocks. I am well aware of the difficulty of bringing about such a change in the way of handling them as I have indicated in the foregoing. It sounds radical to advocate the doing away with the distinctive names of the different woods and selling lumber as lumber without any reference to its particular name or where it came from. But, really, my friends, I believe it is entirely practicable with stocks that are of uniform manufacture. I believe, furthermore, that it lies within the power of the retail lumbermen in the country districts to effect any reasonable change in their methods, irrespective of old time notions of carpenter or farmer consumer. Practically the real and greatest difficulty in the doing of this sort of thing lies in the fact that the dealers are in need of being educated themselves up to the taking of individual action in such matters as conflict with established customs. One don't care to make such a move unless he knows his competitor will do the same. The world of action is full of cases where one man is waiting for the other to make the start, and is perfectly willing to follow, but lacks the initiative to start himself It is only the very, very few who make tracks of their own. Every action of a better and progressive nature has been made by those who were not afraid to back up their own judgment by independent and initial effort, and under their own guidance.

The line yard systems have done a great deal in this direction of bettering the methods of doing business, and I have often wondered why they have not made some move to escape the old established tyranny of making distinctions in the kinds of lumber. It is hard to get independent dealers to take any unified action in the changing of any old custom, even though they know it is expensive. But with the line yard companies it is different in this respect, for if one system adopts anything that will lessen the amount of capital required to operate a yard without diminishing its efficiency and giving the trade as good service as before, it will not be hard to induce their competitors to imitate them. Every time a car load of material is shipped in on a local dealer by a poaching wrecking house he receives a valuable lesson in the art of selling lumber, and of how prejudice may be overcome in a consumer who only knows it also as such. Probably some of you have looked over the contents of such a car that saved the purchaser 50 per cent. of what you had asked him. If you have noticed, no doubt, that in filling the bill the "poachers" had wholly ignored the specifications of the local carpenter who made it out, and the bill was filled with what cost the seller the least in the market. But say, did you go around and look at that house after it was finished and painted. If you did, I'll bet you could not tell what kind of woods it was built of from the appearance. Do you see the point of these observations?

C. H. Ketridge, in the Mississippi Valley Lumberman.

Buying Stock for the Retail Yard

That the retail lumber dealer shall be a good buyer as well as a good seller is important. But, as in all else, there is a possibility that too much stress may be put on a good thing. There is danger of that economy that has been called "saving at the spigot and wasting at the bunghole." The dealer who rather prides himself upon being a shrewd buyer may cultivate that shrewdness at the expense of his business; and, in attempting to read the market closely and endeavoring to tide over a time of good prices to wait for lower prices before stocking up, may ultimately suffer a loss.

The handling of lumber at retail is merchandising and not speculation. It is desirable that lumber be bought at the best price prevailing, but it is undesirable to run stocks too low in the hope that they may be replenished later at a cheap price. The chief concern for the retailer who desires to serve his community, and thereby to establish himself in the confidence of the consuming public, should be ability to furnish stock goods when required. To be caught short on a stock item while waiting for a break in the market may cost a sale and possibly future sales—and, at that, the break may not come.

It would seem that the best policy for the retailer is to look at the merchandising end of the business; to see to it primarily that the stock is complete and sufficient for the requirements of his neighborhood. He may buy now and then find that a little lower price prevails later. But if a lower price comes it is due to some general depression as a rule and the dealer then will be timid about buying, though the price level he has been waiting for is achieved. The best time to buy and sell commodities is when such commodities are in demand, and the little difference in price will be more than offset by ability to serve the trade promptly and well in good times or ill.—American Lumberman.

Will Push Trust Enquiries

Following closely on the action against the Retail Lumber Dealers' Association of the west and the action against the retailers of the east, the United States Government now has determined upon a thorough inquiry into the methods of wholesale trading in lumber. It has been represented that the retail lumber dealers, who have been under fire by the government and the manufacturers are maintaining agreements to curtail the manufacture of lumber so as to increase the demand and the prices, that there have been attempts to monopolize the supply of certain kinds of lumber in certain sections of the country, and that in some sections a uniform price has been maintained which has resulted in increasing the price twenty per cent. in the last two years in the face of a decreasing demand. Attorney-general Wickersham, it is said, intends to push the investigation of retailing and monopolizing methods.

Avoid the Car Shortage—Order Now

The wise retailer will anticipate the car shortage this fall and buy his supply immediately. The Mountain Lumber Manufacturers' Association held a meeting recently to consider the matter, and decided to make every possible effort to impress upon the retailers the danger of a car shortage this fall. I am in communication with the officials of the Canadian Pacific Railway Company and they have told me that cars for lumber will be very scarce this fall. When they admit that a shortage is likely to occur there is real danger."—W. A. Austie, secretary Mountain Lumber Manufacturers' Association.

Gordon, Grant and Company, Port-of-Spain, Trinidad, report under date of July 10 as follows:—Lumber and Cooperage Materials—The only arrival of pitch pine to report is the Bktne. Skoda from Mobile, and there is still room for a few cargoes of good quality assorted to meet present requirements. White pine boards are in constant demand and we recommend consignments.

THE WOODWORKER

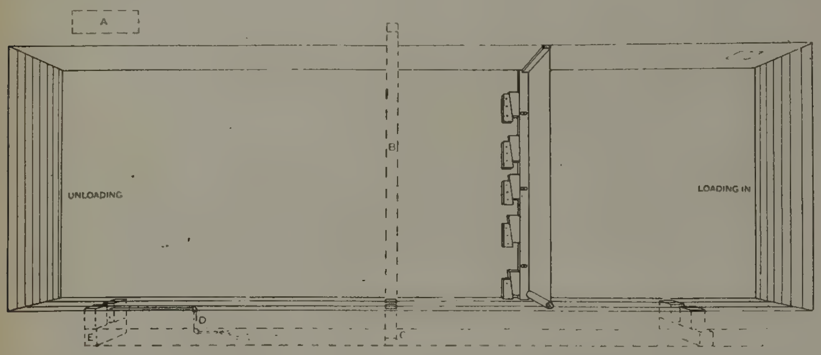
Remodelling an Old Drykiln

Recent discussions on the subject of drykilns have put me in mind of an experience in changing an old kiln which had never done satisfactory work into one which is now drying with certainty and considerable satisfaction.

Through the means of this example I wish to call attention to the fact that a small kiln, for all kinds of work, should not be built on the same plan as the one for a large consumer, where the kiln is filled from one end and discharged from the other. This last-named method is all right for the plant that is using large and steady amounts of the same kinds of lumber, but for the small factory, using small quantities of all kinds of lumber, it is both wasteful and inconvenient.

I will digress here enough to tell about a certain standard kiln which has the right design for a small mill, except that the vital part necessary to make it effective was omitted.

This kiln was built with hollow brick walls and opened from the side instead of the end; this is the proper arrangement for the small kiln, as will presently appear. The kiln was designed by the makers to have partitions between every two cars space, but the owner would not go to the expense of putting them in, and so missed the vital point, as mentioned above. The kiln trucks were set on a set of sub-tracks, which worked on a track running the length of the kiln just outside of the doors, so that the car of lumber could be pushed in front of any door and then switched into the kiln. When dry it could be run out on this track and from that switched again to the planer, on a track running into the mill. This was a very convenient arrangement, and had the partitions been put in the kiln, so that the green lumber could be shut off from that nearly dry, the conditions could hardly have been better.



Perspective View of Interior of Kiln.

But to return to the kiln I started out to tell about. It was built 17 feet wide, 9 feet high and about 60 feet long. It was equipped with full end doors, raised, or rather balanced, by counterweights, and they were very leaky doors at that.

In the first place, 17 feet is not wide enough for an end-loading kiln, because one cannot get past the end of a car of 16-ft. lumber, especially if it has not been trimmed; and the worst drawback of all is that lumber cannot be put in or taken out except at the ends of the kiln. In this case there is barely enough track at each end of the kiln to hold a single car, so that it is impossible to switch out even the car next to the end.

It often happens that an emergency arises in which it is desired to put a car of lumber in the kiln for a few days to finish it off for immediate use. It is obvious that this would take much valuable time if it was immediately preceded by a car of green 2-inch oak. But if the doors were on the side of the kiln, the car could be run in next to lumber nearly dry and so be given the proper conditions and be removed at any time.

This feature of the old kiln was not dealt with, as the structure was not worth building over, and it was out of the question to build a new kiln at the time alluded to. The end doors were fitted as best they might be and held tightly shut against the jambs. The walls of the kilns were wood, filled in between the studs with sawdust, and the floor packed the same way. The interior was lined with building paper and well stripped, so that it was pretty well insulated and leaked air only around the ends.

The accompanying diagram shows a perspective view of the interior of the kiln, as if one whole side was out and we were looking in through the opening. It will be noted that there are three pairs of ducts in the floor of the kiln, and no pipes at all, the heat being furnished by a coil of steam pipes through which the fan drives the air.

The fan house and introducing duct are opposite the pairs of holes at the left, at E, and here is a damper which controls the flow of hot air through both pairs of ducts at the ends of the kiln. The previous arrangement was to shut off the pair at the right-hand end entirely, and use the left-hand pair and that in the middle. The vent was at the dotted line in the ceiling at the right end and opened into the left, from which it could be let out into the open or returned to the fan, through A. There were also two free openings from the outside into the left, which were never closed. The end doors were allowed to stand open somewhat at the top, and it would be natural for the hot air coming through the floor to go out through the ceiling and at the top of the doors.

The temperature in the kiln could hardly be raised to 110 deg. without the use of live steam in the coils, and the fan had been running at such a rate that at this low temperature the green lumber was almost ruined by checking when first put in the kiln. In fact, a large amount of lumber was ruined, and then it took a long time to dry, and at a great expense of steam, as the heat had to be kept up with live steam fourteen hours out of the twenty-four.

Now I will tell how some simple and inexpensive alterations made the difference in the working of this kiln. In the first place, the ducts at the right side of the kiln were opened up again and the middle ducts were made into return ducts and thereby connected with the loft by a chute on the outside of the kiln, as shown at B. The trap in the ceiling was closed permanently, and the benefit of this change lay in the improved circulation, which compelled the air to pass down through the lumber after first taking its natural trip to the ceiling.

The evaporation of the moisture in the wood lowers the temperature of the air somewhat and assists in this downward circulation. Some of the air escapes at the top of the doors, and a corresponding amount of cold air must come in some place else, which will naturally be at the loft or at the fan-house door. By the way, a trap door or damper is provided in the return duct at C, so that the return circulation may be cut off entirely if necessary, but it does not seem necessary to use it.

A study of the figure will show that a canvas partition was hung across the kiln far enough from the right, or loading end to admit two cars of lumber. The purpose of this partition is to make it possible to give the fresh cars a special treatment to prevent checking, and, at the same time, not retard the drying of the balance of the kiln to any great extent. This is accomplished by introducing live steam into the duct leading to this compartment, by means of a half-inch pipe, D, and regulating the flow so as to give practically a saturation until the green lumber has reached a temperature of about 120 degrees. The steam is then reduced, and, as soon as the lumber will stand it, is cut off altogether. A home-made humidistat, is used, and it gives a reliable indication of what the kiln is doing.

The fan is now run at a much lower speed and the air is consequently hotter The kiln can easily be run up to 140 or 150 degrees, and the humidity held at any desired ratio, although a strong cold wind blowing on either end of the kiln will modify the conditions inside considerably. But altogether it is doing pretty well for a kiln which has worn itself out in unsatisfactory and costly service, and the quality of the dried lumber is fine indeed. The cabinetmakers, who have been working its products for twenty years, say they have never seen anything so good come from it previous to the alterations described above.

The yard boss, who attends to the filling of the kiln, is required to see that the trucks are properly loaded and that the sticks are close and in vertical lines, the outer ones at the ends of the boards. The engineer, who is handy to the kiln, is given charge of keeping the temperature and humidity, and no one else is allowed to tamper with it. As the coils are heated with exhaust steam, the drying is not expensive, for the supply of dry lumber can usually be kept up without running full blast nights and Sundays.

The curtain partition is made of 12-oz. duck, fastened to the ceiling with a cleat and with a roller on the bottom. The edges are held between two cleats on the side walls. These cleats are tongued and grooved, and one of them is adjustable, as shown in the drawing. The blocks and wedges crowd the canvas into the joint and hold it perfectly. The cost of these changes, including partition, did not exceed $15, and it has proven a good investment indeed.—Chas. Cloukey in the Woodworker.

The filing room of the box factory is one of the important departments of the business as well as being one of the most troublesome features that the owner or the superintendent has to contend with, says the Barrel & Box. It is very often the case that the filing room is given over to a saw filer and fitter who can put up a logical argument as to the proper methods of fitting saws, but, when his work is gone over by a real expert, he is what is known as an old-timer and little adapted to the fine work necessary to keep up the saws of a modern box factory. An instance was brought out recently in a case of a saw filer who was insisting on buying his saws in the black and tempering them himself. It was found that in hammering the saw his work was so rough that a much larger kerf or set than was at all necessary had to be used in order to make the saw work satisfactorily. It meant to that box manufacturer a larger proportion of waste, a greater sawdust pile, a leak of profits. The importance of this saw filing department should not be underestimated by the box manufacturer, and a little time taken in the investigation of results would be time well spent.

Cost of Manufacturing Boxes

The cost of manufacturing boxes is an old and vexed question, and is just as interesting and important to-day as it ever was. A writer in "The Barrel and Box" gives the results of his experience in the following letter:—

On the cost of manufacturing boxes, it seems to us the only way to figure cost is on the rough material going into the mill. Any other method means that boxes made from lumber showing a great deal of waste are figured at no higher price as to labor than a box manufactured from lumber showing little waste. We figure the overhead to cover commissions, cash discount, general management and office (including depreciation and six per cent. on the plant only), of $1.50 per 1,000. Our depreciation account is not a very high one, nor is our investment account, because we have heretofore written off a good deal of the investment. But unless our plant is kept running to its full capacity the charge of $1.50 will not cover the actual cost, and you will note that there is no margin included in this, only actual cost. In addition we have been figuring $3.50 per 1,000 on the rough lumber for the power plant expense, labor and supply bills. With a good volume of business this seems to take care of the item, but, if the business drops down, there is a large amount of fixed costs that increases this considerably, and in our judgment it should be from 50 cents to $1 per 1,000 more on this item. This expense does not include printing expenses, nor does it include nails, or nailing cleats on ends. We have been figuring that the nailing of cleats on ends costs from 50 cents to 75 cents per 100 ends, or from $1 to $1.50 per 100 boxes, and so far we have made nothing out of our nailing machines over and above the labor, the nails and the power. We know that some manufacturers figure no additional for cleating ends, but unless they figure additional for the value of wide lumber to make ends, they must figure additional for cleating or they will be losers. The nail account alone runs high on small boxes, and it will surprise any one who is not making a charge for cleating, to merely figure cost of the nails entering into the cleated ends that they produce.

On the question of waste we find that we have a very large variation. We use a grade equal to No. 2 common in yellow pine. No. 2 common in gum and No. 2 common in cottonwood. From our past experience we think that this stock will cut up about the same as No. 3 common in Chicago yard white pine grading or the poor end of No. 3 common, and the good end of No. 4 common in Michigan white pine grading. On this stock we have figured our cost very carefully and have run from 12 per cent. to 17 per cent. That is, we produce from 830 feet to 880 feet of finished boxes out of 1,000 feet of lumber. Where a grade as poor as No. 3 common in gum, No. 3 common in yellow pine, or No. 3 common in cottonwood is used the percentage of waste will run from 17 per cent. to 25 per cent., according to the size of the box.

Now, in figuring a matched box, we have always figured an additional percentage of waste to cover the loss of stock in tongueing and grooving. Our experience is that this actual loss is 11 per cent. greater than in the case of a plain box. We know that a number of manufacturers will take the width of the sides, tops and bottoms or ends estimating the number of pieces, and adding the additional width necessary to do the tongueing and grooving, but we found this unsatisfactory because very frequently the matcher would develop some defect in one that for a plain box would not have been objectionable. On some classes of woods the stock will chip up very easily, and in the case of pine, burls or cat faces will frequently be torn out, necessitating the taking back of the piece and re-handling it at an additional waste. For this reason we have taken a ten per cent. waste as our basis for figures where matched stock is required.

The waste is figured on the ordinary size box at 15 per cent. for an unmatched box, and 25 per cent. for the matched box, but in figuring this we do not add the waste, although we see a great many figured where the waste is added. Instead of adding we divide by the amount of stock produced. That is, 850 feet on the thousand in the case of the unmatched, and 750 feet on the thousand in the case of the matched box. If poorer lumber than the grades of No. 2 common in cottonwood and gum, or yellow pine, we figure accordingly. We remember that some years ago you hammered on this question of figuring a long time, but we are surprised to find that a good many box salesmen still have the habit of adding the waste instead of dividing by the amount produced.

Now, you will note that we are located at a southern mill point, and taking basis for No. 2 common gum at $9.50 per 1,000, the following would be our figures:

1,000 feet No. 2 common gum	$9.50
Overhead	1.50
Labor	3.50
Total	$14.50
Producing 850 feet, for unmatched boxes, making the cost of this box per 1,000	$17.06
If a matched box and net contents are figured, the stock will produce 750 feet, making a net cost of	19.33

To these should be added profit (we add 10 per cent.) and freight. This makes our net profit run from 8 per cent. to 9 per cent., as there is invariably some expense that is not covered by the figures that we have been giving and this is certainly not excessive on volume of $40,000 to $50,000 per year in business. In fact, if the northern box manufacturer pays rent he would have so little profit on this basis of figuring that he could not pay himself a decent salary for his services and make interest on investment, yet we find that our prices are underbid for from $2 to $3 per 1,000, and we have heard of one order having been delivered to the factory in shook form at $19.25 per 1,000 feet when the freight was 15 cents per 100 pounds. This was for gum, and would net the manufacturers $15.73 f.o.b. mill on any basis of weights that we have been able to arrive at.

We have also been advised that boxes have been sold at Pittsburg by concerns paying 17 cents freight at $24 per 1,000 for white pine. The grade of the box to be equal to grades specified above. In other words, Michigan No. 5 or Chicago No. 4 would not make the box that is being delivered for those figures.

During the year of 1909 and 1910 our box shop showed no profit; in fact it was a loss, and we have taken this occasion to go over our figures, with our customers, revise same and explain fully to them just how we arrive at them, and show them that any one who figures at less must figure on putting in a poor grade of stock, or must be losing money, which would, of course, effect their future supply, and while we have lost an occasional order the majority of our customers have taken the advances in good heart and have replaced their business with us. It may be a hardship to some of the box manufacturers to do this, but it should be done as it is the only opportunity for the box business to make a dollar during the next eighteen months.

Our experience in connection with the box shook is that the first thing that occurs in dropping of prices in low grade lumber is a large line of cut prices by box manufacturers, and although low grade lumber suitable for boxes has advanced very materially during the last six months, we do not find that any of them have advanced their prices to any extent.

Good Crop Situation in the West

Never in the history of Manitoba has the crop situation been more promising than it is at present. The result is that the threatened shortage of harvest hands is assuming serious proportions. The citizens of Brandon are actively at work with a view to securing sufficient labor for their district when the grain is to be handled. It is estimated that over 2,000 men will be required for this district alone. The mayor and one of the aldermen have been appointed to visit agricultural districts in the United States along the Great Northern Railway with a view to inducing harvesters to migrate to Canada.

The records of the timber branch of the British Columbia Lands Department for the month of June show a total of 569 timber licenses issued for lands west of the Cascade range, bringing to the treasury receipts of $80,420. For lands east of the Cascades 262 licenses were issued, producing a revenue of $30,370. Other items of the month' business included special timber license transfer fees, $770; penalties, $3,225; 203 coal prospecting licenses, $20,050; coal prospecting license transfer fees, $275; and miscellaneous, $1,376.12; a total for the month of $136,486.12. The provincial log scalers during June scaled 66,000,000 feet of logs, an advance of 6,000,000 feet over the corresponding month of last year.

The late Peter Whelen, manager of the Sheppard & Morse Lumber Company, left an estate probated at $363,000.

United Kingdom Trade—Pitwoods and Credits

Liverpool, July 15.—The Use of Pitwoods.—The importance of the branch of the timber trade which provides the wood required for use in the coal-mining industry of the United Kingdom, underground, has just been emphasized by the importers of pitwood at the Bristol channel ports. While large quantities of pitwood are being imported continuously at the Tyne ports, Hartlepool and Sunderland, still larger quantities of the wood are imported at the great coal ports in the Bristol Channel for use in the South Wales' coal mining industry. Here, the importation of pitwood is carried on as a distinct branch of the timber trade. On June 30, those engaged in this branch of the trade, met to consider decisions which had been arrived at by exporters of pitwood and large dealers in the wood, at a meeting held at Paris on June 27. At that meeting it was decided that the diameter of the 6½ ft. lengths, from that time, should not fall below 9 centimetres; while the increased proportion of the 9 ft. should have a minimum diameter of 13 centimetres. The agreement with respect to these dimensions is to be for one year, but may be continued after that time, subject to six months' notice by either side. The British Channel importers, recognizing that as the dimensions named were to fix minimum sizes, the props imported would generally be of larger diameters than those imported in the past, so that fewer props would probably be received per consignment. Of late, the importation has gone on briskly and on a large scale, while the wood has passed freely into consumption. The consumption of coal continues to increase so that the out-turn of coal at the colleries must increase, so long as an increased yield can be obtained. These facts give new importance to the pit-prop branch of the timber trade. The wood is wanted in large and increasing quantities and must be supplied by someone.

Wood for Farm Uses

The annual show of the Royal Agricultural Society of England, which was held from June 26 to 29 at the old City of Norwich, reminded a very large number of people who were interested in outbuildings, gates, hurdles, temporary platforms, palisading and other erections of the plain and inexpensive out-door class, that such structures were still being provided by firms who have specialized in the production of structures of this kind, in oak or other wood. Gates, posts, farm building and other structures, of oak, ash, spruce or fir, some of them creosoted, were shown at Norwich by several firms, among them being English Brothers and Foster & Sons (Wisbeach); Economic Fencing Company, and Cardon & Cresus (London); Peter Patrick & Son (Otley); and Frank P. Potter (Kings Lynn). A fairly large display of gates, posts, sheds and other buildings for farm uses is made at the principal agricultural shows in England, for despite the claims made for iron and wire fencing, and for corrugated iron, wood gates and fencing are still largely used. Portable wood fencing, made in lengths of about 9 feet, is used, practically all over the United Kingdom, and is a most useful item of field equipment. This fencing is usually of plain oak or ash, the lengths being made with a strong upright rail at each end about 4 ft. x 2½ or 3 ins.; x 1½ or 1¾ ins., the edges being rough-shaven, and the lower part of each rail, for about 12 inches, being pointed, to admit of driving into the earth. Each upright rail has three or four mortice holes, quite through it, to admit the longitudinal rails. These are fixed in the mortice holes. lengthwise, to form the "paling" or "hurdle" as it is termed. Two other light rails are secured cross-wise on the longitudinal rails as stays or "binders," usually meeting in a point at the middle of the top rail, each being fixed on the slant outwards towards the bottom rail. This stiffens the whole structure. For gates and gate-posts, oak is still the material most used, though of late gates have been made of one of the harder pine woods. The consumption of oak or pine for farm use is generally but small in a particular locality, but as it goes on practically over the whole of the United Kingdom, it represents a moderately large consumption on the whole.

Shortening Long Credit

The members of the London timber trade have expressed their views fully and freely on the long credit system, which has become so great a bane to the trade, and have taken a step towards shortening the periods of credit. Mr. G. H. Lindsey, Renton, vice-president of the Timber Trade Federation, convened a meeting of the trade for Wednesday, July 12, for a full and outspoken discussion of the subject. The meeting was held at the offices of the Federation. A sub-committee, who had had the subject before them, submitted proposals with regard to terms of payment in these words: "That the terms of credit shall be uniformly fixed as follows:

"1. That the terms of credit shall be uniformly fixed as follows:

"(a) Cash less 2½ per cent. on or before end of month following delivery; or

The committee were authorized to communicate to the trade the acquiescence in the proposed terms and that it was desirable that all firms adhering to the arrangement should notify their respective customers of the change in the term of credit on forms to be issued by the Federation. The proviso with regard to cash payments, it may be mentioned, is in common use, the general custom among merchants and brokers being that of payment "within a month," as it is termed.

The second proposal, with regard to acceptances, touched a more controversial phase of the subject, as the practice had become pretty much what a buyer presumed to make it for himself, and what a seller was prepared to concur in. The recommendation made was as follows:

"(b) Acceptance at four months in lieu of six as at present prevailing.

"2. That the special committee be instructed and empowered to communicate with the trade as a whole, whether members of the Federation or not, inviting their acquiescence in the proposed arrangement.

"3. That it is desirable that all firms adhering to the arrangement shall notify the same in identical terms to their respective customers on forms to be issued officially by the Federation."

A strenuous attempt will be made to obtain a full recognition of the four months' term, but it remains to be seen to what extent the more "long-winded" members will adopt the new terms. Sellers are very considerate and accommodating, and some traders do not hesitate to use to the full any latitude which may be allowed them, so that one month, nominal, often becomes two months, actual, and three months nominal, four months actual. In accordance with this practice four months nominal may easily become five months or even six months, actual. The wish of the trade is that the acceptance term shall be shortened, and buyers as a body will, no doubt, observe that. If the whole of the long-credit men do not conform to the views of the sub-committee who drew up the recommendations, their number will at least be reduced, so that the trade as a whole will gain through the effort which has just been made to improve the custom of the trade in the matter of paying for goods purchased.

London Trade Continues Quiet

Messrs. Churchill & Sim, London, Eng., in their monthly report upon the timber trade for June, write as follows:—

"June has been an exceedingly quiet month in every branch of the wood trade. In London the consumption has suffered from the two bank holidays and much other holiday making in connection with the Coronation festivities, but the importation has also continued small, and the comparative position of the dock stock has again improved. It may be estimated now at nearly 5,000 standards less than it was in the middle of last year. Slow progress has been made with sales for arrival. Shippers continue to wait on buyers' convenience as to when they will make further purchases, but are not so far inclined to make concessions in price of any importance. The fact that buyers are not able to deal profitably with their early importations, being largely due to excessive competition amongst themselves, is thought by shippers to be capable of some other remedy than that of a reduction in the prices of their later supplies. The labor troubles in the shipping trade are adversely affecting many of the large coast ports, but have not so far stopped business in London. The immediate effect may be that of a wholesome hindrance of supplies; and a very definite rise in freight rates has already taken place in the same connection. It does not seem likely that the whole machinery for dealing with the freight and landing of wood will be stopped this time, but the alternative is likely enough to result in a further increase of wages, and this should be borne in mind by importers when considering the rather burning question of their rates of profit.

"The stocks of timber at the public docks on June 30 included the following:—

From the St. Lawrence	1911 Pieces	1910 Pieces
Pine deals	106,000	224,000
Spruce deals	219,000	189,000
Birch planks	67,000	63,000
From New Brunswick, etc.—		
Pine deals	20,000	32,000
Spruce deals	259,000	299,000
Birch planks	169,000	178,000

"The June importation of pine deals is a very small one to London, and quotations for shipment are most fully maintained. The market here therefore may be said to be again on the upward grade for the small quantities which can be sold as they are wanted. With any pressure to sell, however, the whole level of the market is too high for prices to be fully maintained, and one or two parcels have changed hands during the month at rates which look like bargains for the buyers. A fair quantity of spruce deals have come to London during June, principally, and rather exceptionally from the St. Lawrence ports. The market is firm without much demand, being sustained by rather well-authenticated reports of serious difficulties with the supplies from the lower ports. All the hardwoods and yellow pine timber have been out of favor during June so far as the London market is concerned.

Forestry and the Lumber Trade

An interesting article appeared in the "Forestry Quarterly," issue of June, 1911, entitled "Forestry and the Lumber Business." This article was written by J. E. Rhodes, secretary of the Weyerhauser Lumber Company. Mr. Rhodes is essentially a "practical lumberman," in the full sense of that term, as it is used by practical lumbermen in distinguishing themselves from foresters, or those who advocate forestry methods. He presents a brief history of the lumber business, noting the advances in price of both stumpage and manufactured lumber. He mentions the significant fact that, although the prices of lumber declined after the money stringency of 1907, the prices of standing timber did not. He then states that the lack of adequate protection of forests from fire and the unreasonable and illogical taxation laws at present in force in the United States are the chief obstacles to the practice of forestry in connection with the lumber business. By the practice of forestry, he means, such rguelation of the cutting of virgin timber that the forest may perpetuate itself. The professional foresters must address themselves to the task of subduing forest fires. Next they will apply themselves to the inauguration of conservative methods in the handling of government timberlands, reforestation, etc. Furthermore, it is evident that there will have to be a radical change in the prsent methods of taxation before the lumberman can interest himself in conservation methods of logging. The problem of how best to tax timber wealth in such a way as to encourage forestry, while at the same time making it bear its just burden of the expense of government, is one in which the foresters can very properly interest themselves.

To ascertain what the actual burden of taxation on timberlands in the United States is to-day, will require an exhaustive study covering a long period of time. Thus Mr. Rhodes aims to show that the chief and almost the only field of activity for foresters is in the government service. He makes some exception to this, however, in a paragraph towards the end of his article, which reads as follows:

"If the young foresters desire to spend a few years living in the woods, a limited number of men can even now find employment as timber cruisers. As stumpage increases in value, the old-fashioned haphazard methods of estimating timber are found to be unsatis factory. Lumbermen, especially operating in white pine, have found that trained foresters can estimate the amount of timber on a given tract of land much more closely than can the old-fashioned cruiser. A trained forester consumes considerably more time in estimating timber, than does the old-time woodsman, because he calipers trees, but his increased accuracy is worth far more than the difference in the cost. The forester who seeks employment with lumber companies must be skilled in work of this kind, and the time is not far away when those dealing in timberlands will require that the estimates of standing timber be made in a careful and scientific manner, to include accurate map work and detailed reports of topography, species, and the general physical conditions of the country covered. This work requires men of good physique, who are willing to live in the woods for months at a time. It is about the only branch of the lumber industry, as it is at present conducted, in which the scientific knowledge of the forester can be especially serviceable."

Here Mr. Rhodes voices an ever-growing tendency among the lumbermen and timber owners of to-day, the tendency to acquire more accurate knowledge of conditions existing on their timberlands.

The lack of accurate, complete and detailed information, compiled in the form of reports, maps, and systematically arranged estimates is coming to be strongly felt. A great many feel this lack, but do not fully realize what it is that they need. Among the forest engineers who are giving special attention to work of this nature may be mentioned the well-known firm of C. A. Lyford & Company, of Montreal, whose office is at Room 206 Board of Trade Building. Their western associates are Clark & Lyford, of Vancouver, B.C.

Special Catalogue of Silo Materials

The M. Brennen & Sons Manufacturing Company, Limited, Hamilton, Ont., have issued a folder drawing attention to a seasonable specialty which they manufacture, in the form of silo material. The folder gives prices and particulars and presents a good argument for all who are looking for silo material, to get into touch with this firm.

Norton Grinding Wheel Catalogue

The Norton Company, Worcester, Mass., manufacturers of grinding wheels, have issued an interesting illustrated booklet upon "Safety as Applied to Grinding Wheels." In view of the widespread interest in the subject of accident prevention and relief, the booklet is very timely and will prove interesting to all engaged in the filing of saws and other wood-working machinery. The company will gladly send a copy of the booklet to anyone interested upon request.

A New Firm in New York Trade

Ernest Gilmore Gardner and Robert W. Swan have joined forces for the buying and selling of timber lands, with offices at 60 Wall Street, New York. Mr. Gardner is well known in the eastern field, while Mr. Swan occupies a position of equal importance in the southern and southwestern states. It is their intention to extend their endeavors and deal in northwestern and Canadian timber.

Pulpwood Production in Canada

The forestry branch of the Department of the Interior has published an official statement of the pulpwood industry. The report will be revised and kept up to date in the future.

According to the figures Quebec in the last year used 319,935 cords of pulp wood of the value of $1,866,700 and produced 238,286 tons of pulp. Ontario used 187,352 cords of pulp wood of the value of $1,070,740 and produced 132,491 tons of pulp. In New Brunswick there were 88,450 cords used valued at $414,689 producing 49,991 tons of pulp. Nova Scotia produced 23,996 tons of pulp from 25,076 cords, valued at $101,945.

Canada imports no pulp wood. There are sixty mills in this country and fifty of them reported, there being no reports from ten establishments. There is an aggregate consumption in Canada of 622,129 cords of wood.

Of the total pulp wood manufactured by the Dominion, Quebec mills use 51.4 per cent.; Ontario, 32.4; New Brunswick, 14.2; Nova Scotia, 4.1; British Columbia manufactured pulp for the first time in 1909, using only 2-10 of 1 per cent. of the total.

Canada's foreign trade in wood pulp and pulp wood has consisted entirely in exports. In 1909 the aggregate was 280,744 tons of a value of $4,898,842. The United States took, of this amount, $2,482,221 in mechanical pulp and $1,459,340 in chemical. The proportion of mechanical pulp manufactured in this country is comparatively large. Some 87 per cent. of the exports are mechanical, whereas only 73 per cent. of the pulp manufactured in the Dominion was mechanically prepared.

Each year the United States takes an increasing proportion of pulp shipped from Canada. During the fiscal years 1902 to 1908 inclusive the United States imported 776,289 tons of pulp wood from the Dominion or over 70 per cent. of the total wood pulp imports of that country for that period. In 1899 the value of pulp for export was $1,274,367. Ten years later it was $4,306,929, an increase of 238 per cent.

In 1909 three-fifths of the pulp wood cut in Canada was shipped to the United States. The consideration received for this 915,633 cords was $5,752,629 or $6.28 per cord more at the point of shipment than was paid by Canadian mills. Nearly all this wood went from Quebec. This wood furnished 46.4 per cent. of the raw material used in the ninety pulp mills of New York State; 10.3 of the raw material used in the sixty-two mills of New England, Maine, Massachusetts, New Hampshire and Vermont and 6.10 of that used in the sixteen pulp mills of Pennsylvania.

One-half the pulp mills of Canada are in Quebec, one-fifth in Ontario and the rest in the three provinces of New Brunswick, Nova Scotia and British Columbia. Measured by their cord consumption the largest mills are in Ontario, which use 18,735 cords each on an average. Quebec was 12,797 per mill per year and New Brunswick 12,366, while Nova Scotia accounts for an average of 4,179 and British Columbia for 658. The average pulp wood consumption for Canada was 12,442 cords per mill year. Three-quarters of the manufacture was mechanical, 23 per cent. sulphite and the remainder soda.

A big improvement to the lumber shipping facilities of Hull and district is sought by J. R. Booth, Shepard & Morse Lumber Company, Ottawa Transportation Company, Ottawa Forwarding Company, Board of Trade of Ottawa and Ottawa City Council. They will ask the Dominion government to construct a public wharf on Victoria Island recently bought for a shipyard. The dock service is inadequate and was mostly furnished by the lumbermen without government aid.

CAMP DEPARTMENT

The Work of the Timber Cruiser

By Jas. E. Emigh

This subject has been given very little space in any publication, and having had a great deal of experience with so-called timber cruisers, perhaps my ideas may be of interest to others engaged in the manufacture of lumber.

A tract is offered for sale, the timber having been estimated by expert cruisers, "whose opinions cannot be questioned." A list is given you of the kind and amount of timber that the tract is said to contain. The figures look good to you at the price asked, and you can hardly rest until you have looked this tract over—only to go away in disappointment and disgust, after having made a preliminary investigation that has cost you quite a sum, with a by no means friendly feeling for the experts. Then you see that it will not justify a further cruise by yourself.

I have never yet looked over a single tract that anyway near came up to what it was represented to be. Large sums of money have been expended on just such wild goose chases. The time will come when the owners of tracts will have to back up the estimates of the cruisers with a guarantee, or prospective purchasers will not waste time and expense looking them over.

On a tract of 1,200 acres which the writer had the pleasure to manufacture, the cruisers had placed an estimate that would average 6,000 feet per acre. This, however, did not induce us to purchase the tract, but after a thorough investigation the tract was taken over at the price asked; but not for one minute did we think that it would cut 3,500 feet per acre; and after all the merchantable timber was cut off we found that we were not any too close to our estimate. However, we did not over estimate to any great extent. Strict account was kept of all the timber that was cut from this tract, and as we only learn by experience, we filed these figures away for future use. It is a vantage point to figure from, by way of comparison, with other tracts that you look over with a view to purchase.

Cruisers are not always wrong, however, for in a few cases I have found their estimates nearly in line; but in these cases a cruise and estimate are of little or no value to the prospective purchaser. Summing it all up, it comes down to a dollars-and-cents basis. What is wanted is the price per 1,000 feet that the stumpage will cost, and what kind of material can be manufactured from the kinds of timber that are on the tract. This can only be determined by the purchaser or man of experience. When these things are in line with the market prices of the products, you have a safe basis to figure from. Here is where cruisers are of little or no value. Few, if any, have ever had any experience in the manufacture of lumber, and are ignorant of the defects that are peculiar to certain kinds of wood and in certain localities. The cruise they make is based upon theory, as laid down by some supposed authority, and which is not at all to be relied upon.

Of course, no one can tell just how timber will saw out until after the sawing, but a man of experience, in a matter-of-fact way, can see through a log as if it were transparent, and this is a great advantage in estimating timber. After cutting a few tracts you can figure from comparison as to the quality of timber, and base your figures on such comparison as to whether the timber is worth the price asked or not. I would not take the responsibility to estimate and cruise a tract for any one. Not that I think I am not competent, but the fact is I know of no man whom I would want to back up in such an undertaking, and would not want any one to purchase on my judgment.

My advice to those who have any intention of purchasing timber is to not be misled by flattering estimates placed by timber cruisers. If you have had no experience in timber lines it would be policy to try some other investment. There are cruisers who, as far as knowledge of timber is concerned, know more than I will ever know; they have made forestry a study and can tell all about the different species and kinds of timber and the classes to which they belong. They are, however, sadly in need of mill experience, and cannot show you where the dollars and cents are to come out of the trees, therefore they are of no value and are a bait for the sucker.—The Woodworker.

Serious forest fires have been occurring recently in the western portion of the County of Cumberland, N.S. The fire is reported to have originated in the lumber property owned by Cochrane & Soley, at Fox River. They claim that it was of incendiary origin. At latest reports the fire had run through valuable lumber lands and had burned a swath from six to eight miles wide for a distance of from twenty to thirty miles.

Timber for Hudson Bay Railway

"There is probably enough timber available to build the rough construction work of the Hudson Bay Railway."

During the summer of 1910 the Forestry Branch of the Department of the Interior had a party exploring along a portion of the proposed route of the Hudson Bay Railway and in the words just quoted the head of the party (Mr. J. R. Dickson, B.S.F., Assistant Inspector of Forest Reserves) in his report, just published, gives his impression of the timber of that part of the country.

The party started at The Pas and covered some eight thousand square miles of territory. Their explorations included the country around Mitishto lake, the Mitishto river, the Grass river system, with its numerous lake expansions (including Kekusko lake), Pakwa (or Pakwahigan) lake, Setting and Split lakes and the Nelson river system, including Cross and Sipiwesk lakes, Wintering and Landing lakes, return being made by way of the Minago (or Pine) river. The district inspected covered some 235 miles of the line of the proposed railway.

The method followed was to run inspection lines at three to six mile intervals. The men worked singly, running the lines by compass, and were able to travel from four to six miles per day and return to the line. In this way a rapid reconnaissance was made, which was extended by the use of field glasses.

Timber of the Region

Through the country covered by the exploration no timber was found at any distance back from the water. "Only a mere fraction of one per cent. of the area surveyed now carries merchantable timber," the report says.

Spruce is, for the most part, the only timber there which is large enough for saw-timber or railway ties. The poplar, birch and jack pine are too short, spindly, limby and crooked for anything but fuel and pulpwood. Practically all the tamarack has been killed by insects. "We did not find two hundred green tamarack above ten inches in diameter all summer," writes Mr. Dickson.

The total number of ties available in the district traversed is estimated at some 360,000; the saw-timber totals about nine and a half million feet. For pile timber dead tamaracks and the largest of the close-grained black spruce could be used. The possible supply of fuelwood is enormous, and there will also be a large supply of pulpwood, but much of the timber is as yet too small even for pulping.

The rate of growth, as far as observed, is generally decidedly slow. Black spruce takes on the average, one hundred years to attain a diameter of four to five inches, and in the same period white spruce grows to a diameter of eight to twelve inches, and poplar to eight to ten inches. "I saw no jackpine stand where the trees averaged even six inches in diameter," the author says. The slow rates of growth are largely due to the cold wet soil of the undrained muskegs which cover so much of the district.

Danger from Fire and Insects

"The fire loss and danger is appalling," to use Mr. Dickson's words. Two great fires have occurred, approximately forty and eighty years ago, respectively, and practically every corner of the region has been burned over by these. Instances were frequently noted where these fires had leaped lakes over a mile in width. Fires frequently live in the dry moss all winter and break out again in spring.

The work of the fires is supplemented by that of the bark beetles. Not only have these insects killed practically all the tamarack, but they are now at work destroying the scattered patches of mature spruce. When the beetles have finished their work and killed the trees, a strong wind overthrows these. Finally lightning sets fire to the tangle of debris resulting, and the fire, thus started, may run over mile after mile of the country.

The report makes a number of suggestions for the better protection of the region from fire, but the district is so extensive and practically uninhabited that, if a fire starts, the chances of controlling it, even with a good ranger system, are not at all certain. An interesting point noted is that the Indians of the region are much more careful with fire than the white men.

Brief remarks of much interest are made with regard to the topography, soil, vegetation and climate of the region, its agricultural possibilities, mineral resources, fish, game and fur animals and other topics.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Tank Lumber Wanted

We require 2-in. and 3-in. Tank White Pine, 6-in., 7-in., 8-in. and 10-in.; 10 ft. to 24 ft. Also red pine. Highest prices for Pump Squares. Ontario Wind Engine & Pump Co., Ltd., Toronto, Ont. 7-tf.

FOR SALE—LUMBER, ETC.

For Sale

100 cars Longford Hemlock, assorted sizes.
100 cars Whitney Spruce, any width.
25 cars Ravensworth Birch, 1 in. and thicker.

Apply to Quincy Adams Lumber Company, Limited, Longford Mills, Ontario. 14-17

For Sale

300,000 feet 1 inch Birch.
250,000 feet 1¼ in. to 3 in. Birch.
1st and 2nd and No. 1 Common from three to six months on stick.

ROBERT STEWART, LIMITED,
13-16 Guelph, Ont.

For Sale
Hardwood and Hemlock

If you want to buy Hardwood or Hemlock or Ties, Posts and Shingles, visit limits and make an early contract. Pay as work progresses. Can get you 5 or 10 million feet of each on Georgian Bay. Box 266, Canada Lumberman. 9-16

Lumber for Sale

One car hard Maple and Beech, clean dry stock, cut 1½ and 2 in. squares in lengths of 20 in. to 4 feet, also a quantity of

1 x 2 x 26 in. Beech and Maple, clear.
1 x 2⅛ x 28 in. Beech and Maple, clear.
1 x 2 x 36 in. White Basswood.
2 x 2 x 18 in., 24 in., 28 in., long oak squares.

Planing Mill, Lumber and Coal Yard, in Western Ontario, doing good business; good reason for selling. Box 292, Canada Lumberman, Toronto, Ont. 14-17

For Sale

Planing mill, in a small town in Algoma in the heart of the lumber district and forty miles from Sault Ste. Marie. Apply Box 294, Canada Lumberman, Toronto, Ont. 14-15

Lath Mill and Bolter

For sale, combined lath mill and bolter, made by G. Walter Green, Peterboro. Price new, $200; only used a few days, mill out of business. Half price will buy it. F.O.B. Cars at Kinmount. Apply to J. R. Mark, Kinmount, Ont. 12-15

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

NOTICE

Owner of timber tracts in British Columbia would start logging camps if thoroughly experienced, practical and reliable lumberman can be procured to install and take full charge of them. State experience, salary, etc., in detail. Absolutely confidential. A real opporunity. Address W. R. S., P.O. Box 93, Station O., New York City. 15

Timber and Land Investment

Farm of three hundred acres within 35 miles of Toronto—one hundred acres of which is timber land—Pine, red and white Oak, Maple, Beech, Basswood, etc. Balance of farm is under cultivation, thirteen acres bearing apple orchard. Buildings cost over five thousand. Price, $29,000. Box 160, Canada Lumberman, Toronto, Ont. t.f.

Here is a Snap

Saw Mill and Timber Limit for sale, on Grand Trunk Railway. Easy to lumber limit, contains four to five million feet mixed timber, besides a large quantity of standing and lying dry pine; two million feet free from Crown dues. Mill now running, equipped with trimmers, double edges, slash saws, lath and shingle mill. Price 8,000. It won't cost much to come and see this outfit; it is a bargain. Write Box 37, Barry's Bay. 14-17

For Sale

170 ft. 1 in. good basswood short, 2 to 5 ft.
11 M. ft. 1¼ in. good basswood short, 2 to 5 feet.
14 M. ft. 2 in. good basswood short, 2 to 5 feet.
50 M. ft. 1 in. M. C. Ash.
50 M. ft. 2 in. M. C. Ash.

GEO. C. GOODFELLOW,
c Montreal, Que.

AGENTS WANTED

In Algoma, Georgian Bay, 850 acres, with one and one-half million feet of hardwood, one and one-half million hemlock, 50,000 ft. pine, 25,000 ties, 1,000 poles, 50,000 posts, 300 cords spruce, 10,000 cords firewood and other timber five miles from railroad. Price, $2,500. Other timber can be bought. Great opportunity for small mill, or owner would contract to log and saw it for party advancing expenses. Apply Box 304, Canada Lumberman, Toronto, Ont. 15

For Sale

Timber and Timber Lands, Saw and Shingle Mills, Etc

Some 2,000 acres, greater part virgin timber, situate on Temiscouata Railway, Township Witoworth, P.Q.

Eighteen miles from Riviere du Loup, Station on Intercolonial Railway.

These lots of lands consist of White and Black Spruce, Hemlock, Maple, Birch, Cedar, Ties, and thousands of cords of pulpwood, etc., with saw and shingle mills actually in operation and in complete order.

These are Crown granted lands, including about 30 acres cultivated land and divided by half each side, face to face, by Temiscouata Railway, with siding two hundred feet from the mills, dwelling houses, other buildings. No export duty to be paid. Apply to

M. DESCHINES,
15-18 Fraserville, P.Q., Canada.

MISCELLANEOUS

For Sale

About 35 acres of standing timber, principally cedar poles. Apply S. A. Price, Burhamthorpe, Ont. 14-15

I HAVE FOR SALE ON THE PACIFIC COAST

In Tulare County, California. A choice compact tract of 275,000,000 feet of redwood and 125,000,000 feet of sugar pine, nicely located to operate and can be marketed in Los Angeles, California. I want a buyer in the next six weeks. Can be bought at a bargain.

L. VAN WINKLE,
14-17 Santa Monica, Cal.

A Belt Shifting Wrinkle

The ordinary belt shifting gear used in a saw mill usually consists of two upright iron rods fixed on a cross-bar operated by a lever. If this arrangements is in constant use the edges of the belt often become twisted and damaged and its driving power reduced owing to the dead pressure of the belt forks at a limited point, says the Timber Trades Journal.

Instead of using two iron belt forks much less damage is done to the belt if two pieces of wood, say 12 in. long by 6 in. deep, are fastened to the cross-bar, as when the belt is shifted the uressure is distributed over 12 in. of its edge instead of being concentrated to one spot, as is the case with stationary vertical rods. Another plan is to make the belt forks of hollow porcelain rollers, and allow them to revolve when the belt is shifted, which will reduce the friction considerably. This may appear a simple matter to that count in these days.

Making Joints on Steam Boilers

A considerable number of accidents arise in steam boilers through the manhole and mudhole joints being badly made after the boiler has been cleared out. In the first place, care should be taken that the metal faces of the joints are mare dead true, and this packing should never be used to fill up any irregularities, as a thin true joint will stand better than a thick one. A good material for joints up to, say, 100 lbs. pressure is asbestos board, with thin wire gauze interwoven in it. The different forms of indiarubber become hardened, and are unreliable.

A good plan is to cut thin asbestos rings to the exact sizes of the joit faces, and coat them with blacklead, as they can be readily removed and used several times over. In making the joints of

English Views on B.C. Timber

The daily press of London, Eng., has recently devoted much attention to the description of the position of British Columbia as a timber producing country. The "Times" in a recent full page article said: "Nothing else so greatly impresses a traveller in the great Northwest of Canada as the timber. The railway hurries him through vast tracts of mountain and plain, where for days at a time trees, trees, trees—nothing but trees—meets his eye, as far as his eye can see. To him the timber wealth of the British Columbia forests appears even vaster than it is. For he does not realize that trees which may have a girth of anything from 15 to 50 feet and a height which sometimes reaches 300 feet are not worth cutting down unless they can be easily and cheaply brought to market. Once brought to running water they are easily moved; but a big tree is an awkward as well as a weighty thing to handle on dry land.

"Neither must he use the adjective, which he always does, in fact, use, about timber in British Columbia. He must not speak of it as inexhaustible. For he will soon learn with astonishment, awe, and a certain hasty reproachfulness of spirit, that, far from being inexhaustible, these great resources are already within measurable and measured distance of their end.

"The timber acreage of the world has been estimated to be:—

	Acres
United States	450,000,000
Europe	720,000,000
India	140,000,000
Australia and New Zealand	40,000,000
Japan	28,000,000
Total	1,378,000,000
Canada	1,657,600,000
World total	3,035,600,000

"Computed by money value, half the timber wealth of Canada is in British Columbia, and it is to this great province that the markets of the American middle west are turning for their supplies, and the interior of British Columbia is fast taking the place of the United States as the world's source of timber supplies. Although up to the present very little has come to the European markets, in about three or four years' time it is expected that the Panama Canal will be opened to the traffic of the high seas, and this will bring Vancouver to within 18 days' voyage of England.

"The greatest part of the forests of British Columbia consists of what is commercially known as white pine. This tree, properly called the Douglas Fir, is very widely distributed, and near the coast reaches tremendous proportions. Trees 300 feet high are not uncommon, and the average is about 100 feet, clear of limbs, with a base girth of from 10 feet to 50 feet. The timber is of indispensable commercial value in building construction, shipbuilding, bridgework, and especially in the construction of wharves. When excluded from air, it has the great durability and freedom from rot characteristic of the aromatic firs. The wood is firm and solid, having about the same specific gravity as the British oak. It makes good fencing and railway sleepers, and is used locally even for furniture-making. Growing the most favorably in valleys, it is nevertheless capable of flourishing to a considerable mountain height.

"Next in value to this fine tree comes red cedar. This is much used in the American continent for wooden roofing-tiles, there known as "shingles," but it is capable of nobler employment. It possesses the same sweet aroma as the pencil cedar of Europe, and, taking a magnificent polish, is used for furniture and panelling, and for all interior finish. The color and grain have great variety, whereby its commercial value for decorative purposes is greatly increased.

"The Douglas fir follows the indentations of the wooded coast line, up to the 51st degree of latitude, where it is met by the cypress (or yellow cedar), hemlock, spruce, and the noble red cedar just described. These are all readily marketable trees, and they extend right up to the northern boundary of the province, where it joins the American State of Alaska."

That the Dominion Government should be more careful with regard to the inspection of the various classes of lumber coming into Canada from the United States is the opinion of Mr. A. S. Goodeve, M.P., for many years Provincial Secretary for British Columbia. "Lumbering in the mountain regions of the Kootenay district is somewhat on the decline," says Mr. Goodeve. "Mills are finding the competition in rough lumber coming in from the United States a very serious factor. Some of the mills are already curtailing their output and I believe that the Federal Government should be more careful with regard to the inspection of the various classes of lumber coming into Canada from across the boundary line."

Review of Current Trade Conditions

Ontario

The lumber trade in most of the country districts of Ontario is incluined to be slow, but in the cities a fairly brisk business is in progress generally. The dry spell in the country, for a time put a decided drag upon trade and it looked as though a serious situation might develop. The relief which was brought by the occasional rains of the last fortnight, served, however, to improve the situation. The principal cause of the dullness in the country districts at present is the fact that the farmers have been unusually busy with their crops. Several of the important crops have come together at an earlier period this year than usual, and farmers have been obliged to devote practically all their attention to their harvesting. The result is that the demand for lumber has been considerably diminished for the time being. The crop prospects at present, are very much improved from what they were earlier in the summer, and there is now a tendency towards greater confidence among the country retailers.

Shingles are moving a little more now than a short time ago. A car shortage is to be expected during the fall, and shippers of shingles are taking advantage of the present season to move their stocks. The fact that 200,000,000 bushels of grain are likely to be harvested this fall instead of 150,000,000, which was last year's total, means that there will be an unusual demand upon all freight cars which can handle the grain.

Red pine is moving pretty well and is strong. It is becoming increasing popular among builders who are realizing that it is one of the most useful classes of lumber. An additional cause for the strength in the market for red pine, is the fact that the cut is likely to be somewhat less this year than formerly. Some manufacturers report that the total cut of red pine will be far below normal. Spruce is not so strong as red pine. The demand for spruce in New York has been weakening, and of late the price has fallen off about $2 per thousand. Shingles are firm, at $3.30 for XXX, at Toronto. Some of the lower grades are coming along, having been shipped, in the belief that they will find a ready market. When they reach their destination, however, they are either refused, or a large concession is given to induce customers to take them. The indications are that the supply of lath will be no greater than last year, and that prices will remain firm. Yellow pine dealers have been fairly successful in advancing the price of finish.

There is considerable activity at Ottawa among buyers for some of the British lumber firms. They are busy picking up job-lots of three-inch deals and good white pine sidings. The prices generally are those which have been prevailing since the first of May. Local trade has slacked off a little. The export trade to South America continues good.

Eastern Canada

During the past few months labor has been so scarce in New Brunswick that many of the manufacturers and others in the trade now find themselves with many thousands of dollars worth of orders which they are unable to fill. The Indians work too spasmodically to be of much use except in driving the teams, and the French seem to be leaving for the Canadian west in large numbers. When one French-Canadian moves away the rest grow restless and gradually drift after him, if he writes to say that there is plenty of work and an opportunity for a good time. Cobalt and the other mining districts are also luring away many of the men of the east. All the mills are taxed to their limit and prices are reported to be on the rise. Campbellton is being built up very rapidly, since last year's fire, and many fine buildings are already completed.

The demand for eastern spruce at Boston continues light and there is rather an uneasy feeling about prices. Frames 9 inch and under are offering as a rule at $23.50. Many buyers expect prices to be easier, but manufacturers and dealers are looking for higher prices within a few weeks. This is probably on account of many of the mills being short of logs. Random is quiet, and the demand for spruce covering boards is light. The shingle market at Boston continues quiet, and manufacturers as a rule are accepting lower prices than they expected to secure at this time of year. The top price for cedar extras is about $3.40, but very few buyers can be interested at anything above $3.35. The market for lath is quiet. For 1⅝ inch prices vary from $3.70 to $3.75, and for 1½ inch from $3.40 to $3.50.

Cargo shipments of eastern spruce to New York are very slow, and business is lacking in snap. Prices, however, are well maintained. Most of the yards have sufficient supplies on hand to take care of their customers without being obliged to replenish extensively.

Great Britain

The c.i.f. values for spruce deals in Great Britain show no changes, prices remaining firm without any indication of change in the immediate future. If any alteration in price occurs it is thought that it will be in the direction of a slight advance, as the season progresses, particularly as freights will probably stiffen. The values prevailing at present seem to be quite high enough, according to importers' ideas, and they claim that further advances will mean a noticeable reduction in business.

At London, there is no sign of improvement in the lumber trade. Export and general trade continue fairly good, and the strong demand for paving blocks is also assisting in the consumption of wood goods. Values of deals and flooring sizes are fairly steady, and stocks are only moderate. The market for battens is slow. Deliveries at London docks, for the week ending July 8th, amounted to 8,708 standards, as compared with 8,228 during the corresponding week of last year. At Churchill & Sim's recent auction sale, 3 x 8 second Quebec spruce, and 3 x 9 thirds, were sold at £10 5s. Thick prime Oregon brought 1s. 5d. and 1s. 4d. 4 and 3 x 12 sold at 1s. 6d., and 2 x 11, at 1s. 2d.

At Liverpool, the cessation of the dockers' strike has enabled trade to get on its way again steadily, but the inability of the railway companies handle the stocks which accumulated during the strike, is a great drawback to business. The latest reports were to the effect that it would take a couple of weeks for trade to get into full swing once more. Local importers were, therefore, not much inclined to contract for future delivery, until they had unloaded to their buyers the heavy stocks which accumulated during the strike. No transactions were reported during the week ending July 15, for spruce deals "to arrive." The attitude of most of the large importers was to refrain from entering the market until traffic conditions had become more normal. Liners from Montreal are now discharging shipments regularly at Liverpool, the Canadian season being in full swing. There is a fairly firm c.i.f. market for birch logs, though shippers have a fair amount available for shipment. Arrivals of late have been heavy, somewhat in excess of the demand. Birch planks are in good demand, and firm, with arrivals only moderate.

At Manchester, the conclusion of the strike among the dockers has resulted in an unusual activity in the lumber trade. It will be some time, however, before the congestion of business resulting from the accumulation of cargoes is overcome. The local demand for lumber is not very brisk, and competition is of the cut-throat variety. Joinery prices in particular, are badly cut up. Prices for spruce are unsettled. Some parcels containing a considerable proportion of 7 and 8 x 3 inch can be purchased at £8 c.i.f. Other parcels of Quebec goods which are of the very finest quality of spruce, with only short lengths as a drawback, are bringing 15s., over the price above mentioned. Floorings are steady at about £9 12s. 6d. c.i.f. Pine goods are firm all round. Anything over 10 inches wide in first quality sidings is scarce, and sells at good prices.

At Bristol, the lumber trade is quite brisk, and the numerous arrivals are keeping importers very busy. At Southampton the trade is rather dull. The lumber trade at Glasgow has been dull recently, but this is not surprising at this time of year.

United States

General rains all over the United States, east of the Rocky Mountains have relieved the fear of a drought and have improved business conditions considerably during the past fortnight. The rains, however, came too late to prevent a certain amount of damage to the winter wheat crop, and even to the spring yield. Under such conditions, it would not be unreasonable to expect a fairly satisfactory lumber trade during the rest of the year, were it not for the disturbed financial and political situation. It is to be expected, however, that some revival will take place during the fall and early winter.

Chicago.—Wholesale prices of northern pine are fairly well maintained. Retail prices, however, show some weakness, the result of excessive competition. Most grades of northern pine are moving fairly well at steady prices. The hardwood market has been somewhat more active recently. Factories, however, are not buying as heavily as they did earlier in the year. Plain oak is in moderate supply, and firm. Quarter sawed white oak is unchanged, and red has advanced slightly. Basswood is improving but is still a long way behind its former price. There is a fair outlook for hemlock. Wholesalers are holding to their stocks firmly, and the market generally is strong. There is a possibility that labor troubles in the south will shortly force the southern pine mills to shut down. If

this happens prices are likely to advance, as there would be a shortage of stock. There is a decided tendency in the direction of a stronger market. Red cedar shingles are slightly improving. Clears now bringing $3.12, and stars $2.59, Chicago basis. There is a scarcity of extras, and prices range from $3.10 to $3.15. Standards are less active. Lath are unchanged and sell readily.

Buffalo.—The market for northern pine is moderately active, with the export demand more satisfactory than the domestic. Lower grades have been moving more rapidly than the uppers. The demand for eastern spruce is light on account of the competition of hemlock, and yellow pine. Hardwoods are rather sluggish, although the aggregate volume of business compares favorably with last year. Prices generally are firm. Quartered oak is perhaps a shade off. Plain oak is in good demand, and maple, birch and chestnut are selling well. Stocks of hemlock are plentiful, and trade is fair. Shingles are still low.

Bay City and Saginaw.—A fair volume of business is reported, at steady prices. Receipts by water and by rail have been light. There are no new features in the market, and none are really expected for another month, until the fall business commences.

Market Correspondence

British Buyers Active at Ottawa

Ottawa, July 24th.—While many representatives of the British lumber firms are inclined to complain that the British market is poor, there is just as active buying by them as in any previous year for a corresponding month. Although nearly all the large contracts with British firms are closed around January, yet at this season their buyers are keeping their eyes open for job lots and are picking up a good supply. While they are chiefly looking for three-inch deals, they are ready to buy good white pine sidings. As a rule the prevailing prices since the first of May, are being paid, which are somewhat higher than those previous to that date.

The local trade is slacking off a little and the competition, particularly in the city, is very keen.

The export trade to South America remains very good. The different lumbermen are busy shipping out, and as a rule are somewhat behind in this direction.

While the forest fires were raging, the timber limits of J. R. Booth near Madawaska, and also on Rainy Lake, were threatened. As a precaution the company sent about fifty men from here up to fight the fires. However, the rains furnished a much better protection and very little damage was done to the limits.

The David MacLaren Lumber Company has given the contract to an Ottawa firm to collect all the sunken logs from Buckingham to High Falls.

The International Land and Lumber Company, Limited, is being formed to take over a pulp wood limit on the Salmon River near Lake St. John, Quebec. The limits belonged to a syndicate, of which Mr. A. E. Hunt, M.P. for Compton County, Quebec, held the controlling interest. It has been purchased by the British-Canadian Industrial Company, of this city, which is forming a subsidiary company with a capitalization of $2,000,000, to operate this limit. The limit contains about 300 square miles and is reported to contain a very fine growth. The company will have its headquarters in this city.

It looks as if construction would begin this fall on the Morrisburg and Ottawa Electric Railway. It was necessary to raise $125,000 before the company could be organized and the secretary-treasurer announces that they have already $135,000 subscribed and the organization meeting will be held before the end of the month. The line will be almost direct from this city to Morrisburg and since it goes through a very level country there will be only one bridge of any considerable importance, namely, the one across the Rideau River.

It is understood that the Beaver Board Company, which for sometime has been manufacturing Beaver board at J. R. Booth's mills will shortly erect a large factory of its own in the neighborhood of Aylmer, and will build a town in connection with the factory.

Owing to a heavy demand for certain classes of lumber, some of Gilmour and Hughson's mills will run night and day, necessitating the employment of about one hundred additional hands. On account of the scarcity of this kind of labor in Ottawa and Hull, the men are being secured from Calumet Island.

The move to construct an electric railway line from Ottawa to Smith's Falls and Kingston, is meeting with great success, and the

DRIED FRUITS

WE have never in all our experience seen dried fruits such a close clean up at this time of the year as at present exists. Stocks of Apples and Prunes are completely exhausted. Raisins and Peaches are sky high and the only moderate priced fruits which are suitable for the Camp are Dates and Figs. We offer as follows:

Choice Bright Fat Natural Figs, in 30 lb. Canvas Bags, at 4¼
Choice Quality Hallowee Dates, in 60 lb. Boxes, at 4¾

CAMP BLEND TEA

A substantial good bodied Tea quite suitable for the Camps, packed in Chests and Half-chests. Black, green or mixed at **15c.**

ECONOMY OF OPERATION

is ONE of the essentials to be considered when comparing initial cost of a steam LOG LOADER

Average cost of loading Logs with above "AMERICAN" LOG LOADER purchased nine years ago 10½c. per 1000 feet, everything included.

(Watch for our next ad.)

AMERICAN HOIST & DERRICK COMPANY
ST. PAUL, MINN.

promoters expect to have the engineers on the ground making detailed surveys next month. This line will approximately follow the northwest bank of the Rideau River and canal.

About eighteen men employed in J. R. Booth's paper mill, struck last week, and after staying out for a few days all but two returned on the old scale. Their demand was for an eight-hour day.

There has been a rumor going the rounds that the entire lumber operations of J. R. Booth are to be sold out to a British syndicate. However, the story is entirely denied at the office of the firm.

Good Opportunity for Hardwood Operator

Thessalon, Ont., July 17.—In my last letter I promised you something on the hardwood of Algoma. Few of the many readers of the Canada Lumberman are aware of the immense quantities of hardwood that lie adjacent to Thessalon. We have within thirty miles of Thessalon, 200 millions of hardwood, birch, maple, oak and elm. There is in Thessalon a grand opening for a hardwood industry. There is a splendid site in town at what is known as the Dyment property, mill and yard almost complete. By building about thirty miles of railway this whole district would be reached, and at present the timber could be purchased very cheaply. There is a good chance for any of those who are engaged in the hardwood industry. There is both rail and water shipment. There is about 100 million of the timber patented which can be got from the farmers on easy terms. There was a party from the other side here a few days ago looking into this proposition and they went away satisfied as to the quantity and quality of the timber.

The town of Thessalon would give every consideration to an industry of this description. We have in Thessalon at present a council and also a board of trade who are alive to these questions and would be pleased to take this important matter up with men of good financial standing.—Algoma.

Unsatisfactory Three Months at Glasgow

Messrs. Edmiston & Mitchell's Quarterly Timber Circular, dated Glasgow, June 30th, says:—

"Business in this market during the past three months has failed to show any improvement, the conditions generally remaining as unsatisfactory as they could be, and but for the fair demands which have emanated from the shipbuilding industry the consumption would have been disappointing in the extreme. As it is, and attributable solely to the foregoing reason, the overhead consumption compares quite favorably with that in the same period of either the two preceding years, both of which, it should be mentioned, however, were pretty much in the nature of "lean" years. Unfortunately, prospects for the near future are still none too bright, it being difficult to see from what source any material improvement is to come, but at the same time it seems certain that any change that does eventuate will be for the better; indeed, it is almost impossible to conceive that trade can get worse than it has been during the year so far.

"Shipbuilding is quite busy and assured of steady employment for some time to come, and the outlet in this direction should continue reasonably good, but this is really the one bright spot in the market. House-building is hopeless, any betterment in this industry being out of the question for a long time yet. Boxmakers are quiet, and the general joinery trade is also very dull. Wagon builders are moderately busy, but a good deal of the work they have on hand at present is for all-steel wagons, for which no wood supplies are required. There has been rather an upheaval in the furniture trade in this district, and many failures have recently occurred. This trade was in consequence almost at a complete standstill for a time, but things are now beginning to look better again, and improved demands will probably be in evidence after the summer.

"Turning to the statistical position, imports on the whole have been very moderate, and in the case of Quebec and Low Port deals and sidings were unusually light. In no instance were they really excessive. The overhead consumption is practically on a par with the first six months last year, and while individual increases are shown in waney pine (300 loads), oak logs (370 loads), birch logs (380 loads), birch planks (1,250 loads), Oregon pine (800 loads), mahogany (900 loads), and oak lumber (1,580 loads), decreases are revealed in Quebec deals (420 stds.), low port deals (600 stds.), sawn pitch pine (900 loads), and teak logs (2,500 loads). As regards the stocks remaining on hand, these are generally of a thoroughly healthy nature, the only exception perhaps being teak, the holding of which is much too heavy.

"The Clyde shipbuilding returns for the six months are particularly satisfactory, the output amounting to 135 vessels of 309,860 tons, which is the second highest on record, being exceeded only in 1906, when the output was 336,258 tons. Prospects generally are good, there being sufficient work on hand to ensure steady employment for some considerable time."

ONEIDA,

The Steel Pulley of better belt contact, lightness, maximum strength.

Oneida Steel Pulleys differ from any similar produce made. And in this difference lies their strength,

In construction the Oneida Steel Pulley is ideal. It is strongly reinforced, is lighter than any other steel pulley by ⅓ to ½ and possesses greater strength. The perfectly oval crown face insures a 20% better belt adhesion.

They are built in the greatest range of sizes of any steel pulley in the world, from 6 in. to 126 in. with 2 in. to 40 in. face with ¾ in. to 8½ in. bore.

EDGINGS

Ontario

The Owen Sound Furniture Company, Limited, Owen Sound, Ont., are about to commence operations in their new factory.

The Warren Lumber Company, at Sellwood, Ont., was burned out recently, with heavy loss, much lumber being destroyed.

The Spanish River Pulp & Paper Company, of Esplanola, Ont., will erect a hotel at Espanola. The building is to be 37x150 ft., of brick veneer, with concrete foundation.

A report from New Liskeard states that fire has completely destroyed the mill at Nushka belonging to Mr. J. Perrault. The loss amounts to between $2,000 and $3,000.

The Hocken Lumber Company, of Otter Lake, about six miles from Parry Sound, Ont., recently lost a thousand cords of hemlock bark as the result of serious bush fires.

The Sawyer-Massey Company, Limited, manufacturers of agricultural implements, Hamilton, Ont., have let contracts for the erection of a one-storey factory, 90 x 70 ft., of brick and steel.

The Bain Waggon Company, Woodstock, Ont., are consideraing the erection of a factory building to cost $25,000. Their plans are for a building of four storeys, 127 x 50, of brick and cement.

Leak & Company, Limited, Toronto, have secured an Ontario charter to carry on a lumber business. The provisional directors are William Leak, Herbert Arthur Leak and Emily Leak. The capital is $40,000.

The Consumers Box and Lumber Company, Ernest Avenue, Toronto, are building an addition to their plant. The building will be 230 x 62 ft., of frame construction, covered with iron and with a concrete foundation.

Arrangements are being made by the business men of Eganville, Ont., for the reconstruction of the buildings recently destroyed by fire. The buildings destroyed included eight residences, a roller mill, a hotel, a sawmill and a number of business offices.

The Port Arthur Waggon Works Company, Limited, are erecting a $250,000 factory building, at Port Arthur, Ont. The building is to be 400 x 100 feet, partly one storey, and partly two storeys. The plant will include dry kiln, machine shop, wood shop, assembling shop, etc.

The Consumers Lumber Company, Limited, Hamilton, Ont., have secured an Ontario charter to carry on a wholesale and retail lumber and cement business and a lumber manufacturing business. The capital is $75,000. The provisional directors are Guy H. Long, F. Burton and R. Stewart.

The Conger Lumber Company, Parry Sound, Ont., have recently put in a new lath mill and bolter, manufactured by P. Payette & Company, Penetanguishene, Ont., and also a new hog. The new equipment has increased the capacity of their plant by 10,000 feet per day. The company will cut 15,000,000 feet of lumber this year.

It is reported that the new line of the Canadian Northern Railway from Port Arthur to Montreal will open up a great deal of valuable territory. The railway will pass through a large belt of excellent pine timber which can only be taken out by rail, as the rivers in that district flow to the north. Lumbermen are already looking over the country in advance of construction.

The International Land and Lumber Company, Limited, has obtained an Ontario charter. The capital of the company is placed at $2,000,000, and its head office is to be at Ottawa. The provisional directors include S. A. Huntington, C. E. Sellery, R. H. Simmonds, A. H. Armstrong, and T. A. Beament, all of Ottawa. The purpose of the company is given as that of a land and building company.

The Paget Car Door Company, of Goderich, Ont., are preparing to manufacture car doors. They estimate that they will require a car of lumber each week, as they have contracts with the G. T. R., C. P. R., and C. N. R., for equipping cars. They will employ one hundred men. Mr. J. Youngson, of Goderich, is manager of the company. They have taken over a building erected by the Doty Engine Company.

The Muskoka Wood Manufacturing Company have just finished laying a new switch in their lumber yard at Huntsville, Ont. The space afforded by this switch will add to the piling ground, increasing the capacity of the yard by about two million feet, and will be of much assistance to the company in allowing their lumber to dry more quickly. They have also recently added to their plant an up-to-date machine shop where they will be able to repair almost any break that may occur. The company have also recently installed another of the Berlin Machine Works Company's latest hardwood flooring machines and also an outfit of the most up-to-date filing and grinding machinery.

The Charlton Sawmill Company, Limited, Collingwood, Ont., were rather late this year in getting their logs to the mill, and only started sawing early in July. The company have a very up-to-date mill, the equipment of which includes two single cutting band saws, and the capacity of which is from 75,000 to 100,000 feet per day. They have an excellent system of yards, so planned as to be specially adapted for dry lumber without staining. Their equipment includes two large lake tugs with complete boom equipment. This year they are sawing a large amount of lumber for A. Tait, of Orillia, Ont. Mr. F. R. Roginson is manager and secretary-treasurer of the company, and Mr. E. J. Ryan, mill manager.

A general meeting of the shareholders of the Preston Woodworking Machinery Company, Preston, Ont., was held recently and the following officers were elected: President, W. S. Hudson; vice-president and managing director, M. H. Mullin; 1st vice-president and manager of works, W. J. Murray; secretary-treasurer, Allan Kerr; directors, H. C. Edgar, Fred Fischer, Jr., P. Bernhardt, Geo. Fink, and Lyn Pattinson. Plans have been prepared for the erection of a factory 100 x 100 feet and a moulding shop 40 x 60 feet, for which tenders are now being called. A good site has been secured just east of the G. T. R. freight sheds, and comprising about two acres. The company expect to be in a position to do business in about four months.

The forest fires which recently occurred in Northern Ontario and resulted in such serious loss of life and property at Cochrane and Porcupine, were unfortunately not confined to this locality alone. Extensive fires have occurred in other parts of New Ontario. All along the Canadian Northern, from Sudbury to Sellwood, fire raged furiously, and is reported to have destroyed many millions of feet of timber. The fire even came up to the outskirts of Sudbury and threatened the town itself. At Sellwood the fire was exceptionally fierce and for a time all communication was cut off. It has since been learned that the splendid new sawmills owned by the Warren Lumber Company at Sellwood were entirely destroyed, and that lumber yards with nearly six million feet of white pine were also consumed. It is the intention of the Warren Lumber Company to re-build at once. The insurance on their mill amounted to $63,000.

An indignation meeting was held recently at Sturgeon Falls to protest against hte long delay in the liquidation proceedings in connection with the Imperial Paper Mills. This delay has been a serious drawback to the business interests of the town, resulting in many people moving out and leaving empty houses and stores behind. The mills were put in the hands of the receiver four and one-half years ago and repeated efforts to re-organize or sell the plant have been unsuccessful. All parts of the district of Nipissing were represented at the meeting. The general opinion of the meeting was that the mill could be sold, were it not for the fact that a prohibitive reserve bid had been placed upon it. A strong committee was formed, headed by George Gordon, M.P., to wait upon the Provincial Government and others interested in the sale and ask for immediate relief.

All doubt as to which of the two Soos would secure the $4,000,000 paper mill of the Lake Superior Pulp & Paper Company have been removed, and workmen have commenced the dismantling of several buildings on property recently purchased from the Lake Superior Corporation in the Canadian Soo to make room for the mill. The new building will be 500 feet by 180 feet and will take eighteen months to erect. A new cofferdam is being constructed to augment the power now supplied to the pulp mill, and the output of pulp will also be increased by another 500 tons per day to supply the paper plant. A battery of fourteen boilers is also to be installed in the old power house of the sulphite mill. The plant will employ about 300 hands. Bonds to the value of about $3,500,000 were floated in London several weeks ago. The industry when completed will represent an investment of $8,000,000.

Eastern Canada

C. H. Burns, lumberman, of Fredericton, N.B., is reported to have assigned.

The St. Raymond Paper Mills and limits at St. Raymond, P.Q., are being offered for sale by the Montreal Trust Company.

The plant of the Canada Car & Foundry Company, at Amherst, N.S., will be extended by the erection of reinforced concrete buildings in place of those recently destroyed by fire.

The rotary mill and a quantity of lumber, owned by Timothy Hurley, of Hurley Brook, N.B., on the I. C. R., was destroyed by fire recently. The loss may total in the vicinity of $5,000.

Citizens of Aylmer, P.Q., are petitioning the council to prevent the piling of lumber within the limits of the town. This is the result of the recent fire at Aylmer, by which the firm of R. & T. Ritchie lost a large amount of lumber.

Mr. A. B. Hunt, M.P., has completed the sale of a large timber limit in the Lake St. John district to an English company. This limit embraces an area of 300 square miles of timber land, and it is understood that the new company will build a pulp mill on one of the rivers. The price is said to be $110,000. Mr. Hunt will be a member of the new company.

A syndicate of Montreal capitalists, headed by Messrs. Rodolphe Forget, J. N. Greenshields and J. C. McCuaig, have purchased over eleven hundred square miles of timber limits in the St. Maurice district of the Province of Quebec. They have arranged for the erection on an island at the mouth of the St. Maurice of a pulp and paper plant, which it is estimated will be one of the largest and most modern in the country.

The Swedish Lumber Company are reported to have bought the entire property of Mr. R. O'Leary, Richibucto, as well as the property of the Kent Electric Company in Kent County, N.B. This gives the company about fifty square miles of Crown lands and a large tract of private lands. It is the intention of the company to enlarge the plant at Richibucto. The price received by Mr. O'Leary for his property is said to be $150,000.

The liquidators of A. E. Hamilton & Company, Limited, St. John, N.B., have been granted ten days further by the court of King's Bench to dispose of their Erin street property by auction or private sale. The liquidators announce that parties are negotiating for the purchase of the property and that they will make a further announcement shortly. Thos. H. Somerville, Canada Life Building, St. John, and Geo. A. Hilyard, of Hilyard Brothers, St. John, are the liquidators.

Western Canada

The United Lumber and Shingle Mills, Limited, Vancouver, B.C., have been incorporated, with a capital of $100,000.

The Clark, Green, Wade Logging Company, Limited, 422 Richards Street, Vancouver, have been incorporated, with a capital of $10,000.

The Canadian Timber Investment Company, Limited, Royal Bank Chambers, Vancouver, has been incorporated, with a capital of $400,000, to carry on business as saw and shingle mill owners, timber manufacturers, etc.

The McLelan Lumber Company, Ladner, B.C., are preparing plans for the erection of a sawmill with a capacity of 45,000 feet per day. It was expected that arrangements for construction would be completed by Aug. 1.

The plant of the New Ladysmith Lumber Company, Nanaimo, B.C., was recently damaged by fire. Two kilns and the shingle mill were destroyed, but the sawmill was saved. The loss amounted to $15,000 and was entirely covered by insurance.

The Royal Bank of Canada has made a public issue in London, and advertises the prospectus of the Canadian Pacific Lumber Company, £350,000 six per cent. first mortage bonds at 93. M. B. Carlin, the president, proposes to acquire British Columbia properties. It is reported that the present issue is nearly covered by assets exclusive of timber, and including timber, the issue is secured more than three times over.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Owners-Millmen-Filers

THORNTON CLANEY LUMBER CO

read our "BERLIN QUALITY" monthly

BULLETIN OF IMPROVEMENTS ISSUED MONTHLY BY THE BERLIN MACHINE WORKS.

Not a trade-paper, but a monthly bulletin of improvements made by this company in the wood-working field.

This little publication is being read by the most progressive owners, mill-men and practical men in all parts of the country.

The July paper contains articles by practical superintendents and operators on subjects of vital importance in the handling of machinery with announcements of new machines and new devices by the company.

This little paper is being read widely because it deals solely with the manufacturing side of wood-working and contains articles of intense interest to the mill man who is looked to for results.

A few of the articles in the July issue are as follows:

1. Article on "Band Saw Benchwork,"—C. Hapsburg Liebe.
2. Sanders and the right sandpaper—an article on the right sandpaper for different sanding.
3. The use of the Profiling Attachment—By Chas. Platt.
4. Successful use of thin knives—By Fred Cantin.
5. Resawing hardwood with the Horizontal Resaw—By W. B. Thompson.
6. New Hardwood flooring heads.
7. Development of the fast-feed flooring machine.
8. Slab Resaws and their uses.
9. Motor driven wood-working machinery.
10. Cutting ends automatically in the furniture factory.

A copy of this particular issue will be mailed FREE, to any millman, superintendent, foreman, operator or filer. In writing, state where you are employed. We aim to work with the practical millman by keeping him in touch with the improvements we are constantly making.

"BERLIN QUALITY" Should be Read by Every Man in every Plant.

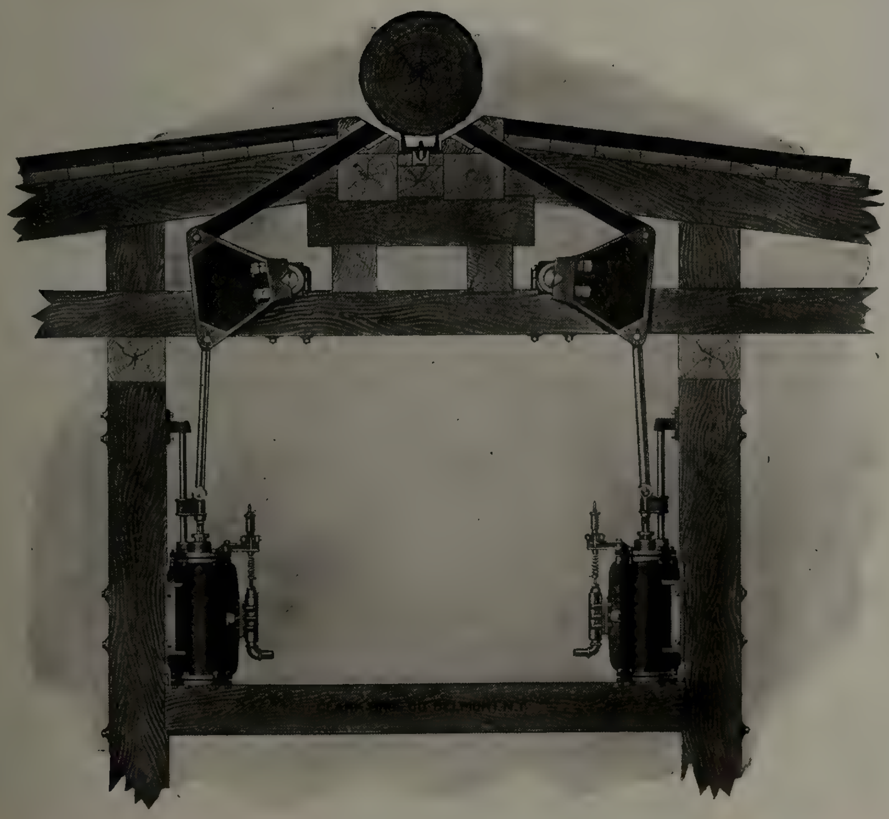
Cheap Machinery is Cheap only in First Cost



A CLARK LOG FLIPPER
ILLUSTRATION SHOWS TWO MACHINES

Cylinders cushion at both ends.
Cylinders have air-cooled feet.
Feet are carefully machined.
This feature saves expensive millwrighting.
Valves are ground perfectly true.
Piston Speed controlled by throttling plug.
Heads packed with copper gaskets.
Cross-heads are cast steel.
Cross-head guides are double rods on 14" to 18" cylinder.
Cross-head guides are single rods on 10" to 12" cylinder.
Push bars are V section steel type.
Pins in arms are not overhung, but supported at both ends by box section arm.
Arms are held by heavy loop bolts to V surfaces.
Shafts are all very large diameter.
We build flippers with cylinders 10" to 18" diameter.
Any number of arms desired.

We build every machine required in an up-to-date sawmill.

ARE YOU SUFFICIENTLY INSURED?

SPECIAL RATES TO LUMBERMEN

Plant of Jno. L. Roper Lumber Co., Newbern, N. C., covered with J-M Asbestos Roofing.

A ready-to-lay Roofing made of Solid Rock Fibres.

J-M Asbestos Ready Roofing is literally made of solid rock fibres. Its base consists of felt made of stone—pure Asbestos. And Asbestos is a natural rock formation. Like all rock or stone, practically everlasting. And known the world over as fire-proof. It is the same material that is used to hold the flame in gas grates—the same material of which we make Asbestos Theatre Curtains. You know Asbestos Curtains are required by law, as protection against fire, in the theatres of nearly all cities.

So no wonder this Asbestos or stone roofing never catches fire, even when neighboring buildings burn to the ground.

J-M ASBESTOS ROOFING

WON'T BURN—WON'T ROT OR DECAY—NEEDS NO PAINT.

We use several layers of this Asbestos or stone felt, and cement them together with genuine Trinidad Lake Asphalt—that wonderful mineral cement which, in Asphalt pavements, stands the grinding of wheels and the hammering of hoofs for 30 or 40 years.

With such indestructible materials as these, do you wonder that J-M Asbestos Roofing often outlasts the building it covers.

And do you wonder that this all-mineral roofing will never need a single cent's worth of paint to keep it from rotting, decaying or otherwise deteriorating.

Other ready roofings are made of wool-felt—or, what is still worse, of shoddy, rag stock, paper pulp, etc.—vegetable and animal materials which nothing can make permanently fire-proof, and which no paint or weather-proofing compound ever discovered can make as lasting as the Asbestos rock and mineral cement used in J-M Asbestos Roofing.

We'll sell you J-M Asbestos Roofing direct from our nearest Branch if your dealer won't supply you.

Write nearest branch for Samples and Catalog No. 303.

THE CANADIAN H. W. JOHNS-MANVILLE CO., Limited

Manufacturers of Asbestos and Magnesia Products

ASBESTOS

Asbestos Roofings, Packings, Electrical Supplies, etc.

Toronto, Ont. Montreal, Que. Winnipeg, Man. Vancouver, B. C.

Its High Daily Average, its ability to always keep a surplus of logs skidded ahead for the leading crew is what places the

CLYDE SELF-PROPELLING STEAM SKIDDER

in a class by itself. Its absolute independence of the loader prevents any interference with its fullest skidding capacity at all times and its self propelling feature saves in both moving and skidding besides the expense of switching.

LOGGING AND INDUSTRIAL LOCOMOTIVES

The knowledge and experience gained in building locomotives of all types, capacities and sizes for every kind of hauling is applied to every locomotive we build, and is available to you.

Our small locomotives for logging, and light switching service are not merely selected from designs previously built, but are special designs to meet special requirements.

They are designed and built with the same care required for 200 ton locomotives. Only the best materials are used in their construction, and every part is made to jigs or templates, guaranteeing that repair parts will fit.

They are constructed with a view to the fact that they must sometimes be operated a considerable distance from shop facilities, therefore simplicity and sturdy construction are vitally necessary.

Fuel cost is always important. This is considered in the design and capacity of the boiler, and in the design throughout.

Write us concerning your requirements or ask for a consultation with our engineers.

We are in position to meet every requirement in locomotives and to supply repair parts at short notice from our Works at Longue Pointe, Montreal, Canada.

OILDAG

(REGISTERED TRADE MARK)

Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E. E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super heated steam practice."

Dry Lumber

Like **you want it ~ *When* you want it ~**

Read This Letter

Woodstock, Ont., Nov. 10, 1910

Grand Rapids Veneer Works,
Grand Rapids, Mich.

Gentlemen :—

In reply to yours of the 2nd inst. would say that your Dry Kiln System has been very satisfactory to us. We have had no difficulty in drying perfectly any kind of material we use except rims. It will dry the material all right but the steam straightens them out. It is the only system in our experience that will dry gum box boards without warping. When we put in additional kilns it certainly will be your system.

Yours truly,
THE BAIN WAGON CO. LIMITED
(Signed) John A. Bain,
Vice-Prest. & Mngr.

We have letters from many more Canadian Factories and Mills which we will send you on request. They will tell you how to

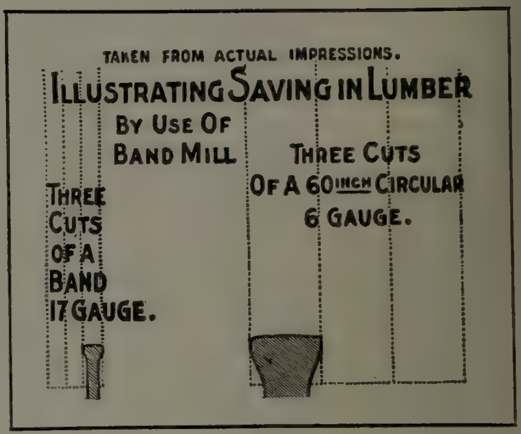
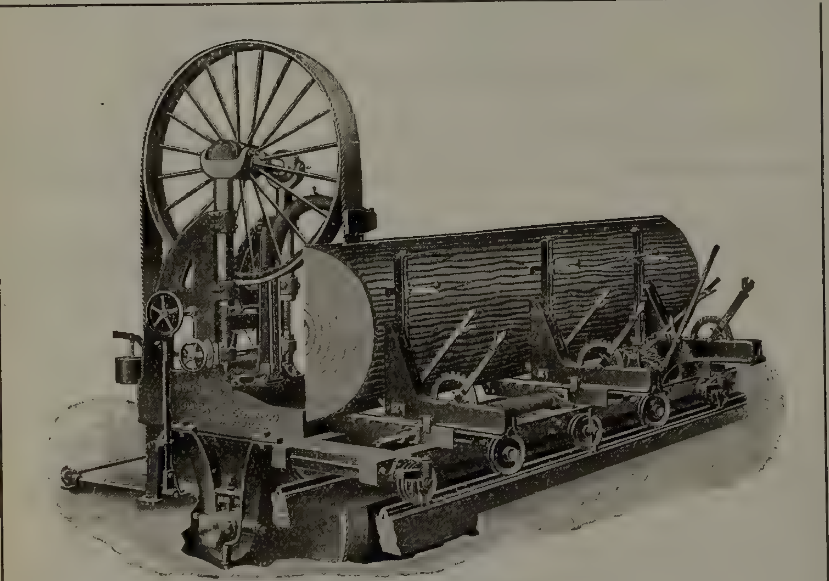
LOST

A perfectly good 1-inch board in every fifth cut when you use a circular mill instead of one of our latest type Band Mills. The drawing herewith shows graphically just what you save in kerf. Not only will you get 20 per cent more lumber out of a given amount of logs, but you will also get higher grade stock at lower production costs. Figure for yourself just what the decrease in kerf waste alone will net you in the course of a year—and we will not have to argue more for Band Mill Efficiency.



TAKEN FROM ACTUAL IMPRESSIONS.
ILLUSTRATING SAVING IN LUMBER
BY USE OF BAND MILL
THREE CUTS OF A BAND 17 GAUGE.
THREE CUTS OF A 60 INCH CIRCULAR 6 GAUGE.

Band Mills Are Not All Alike



No. 57 BAND SAW MILL

THE essential features of a modern Band Mill are first, the strain—we have in our patent knife edge device the most sensitive and positive device ever placed on a band saw; the wheels—our combination of a solid lower and a spoked upper wheel has proved the only perfect arrangement, the lower wheel controlling the upper, preventing overrunning or choking in the heavy cut; third, the bearings—we now equip our mills with annular ball bearings, making them the easiest running now on the market.

FAY & EGAN MILLS are the only ones combining these three important features, permitting the use of thinner blades at higher speed than is possible on any other. The increased efficiency is obvious. Write at once for our Band Mill Catalog, sent free on request.

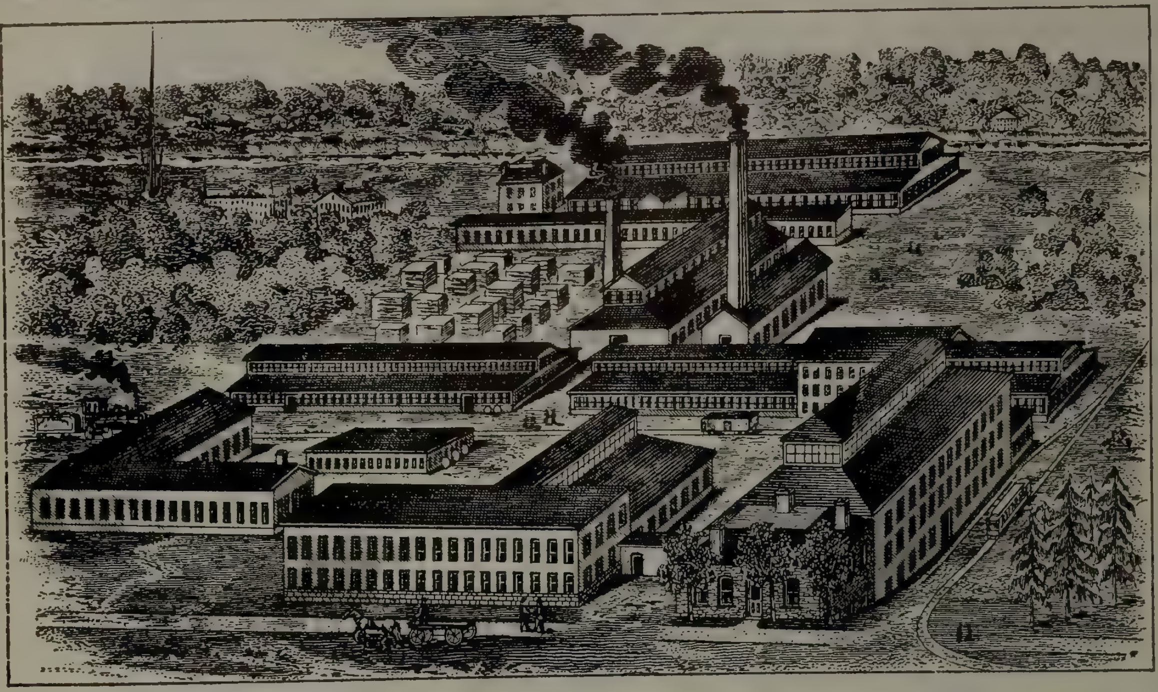
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

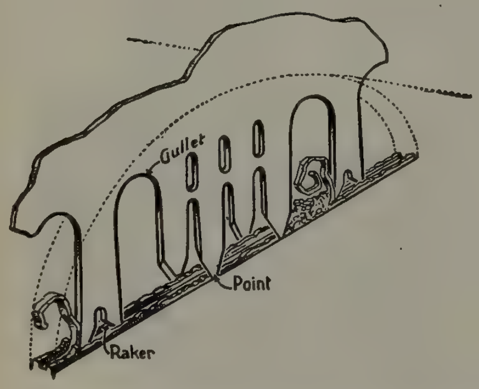


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario



Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

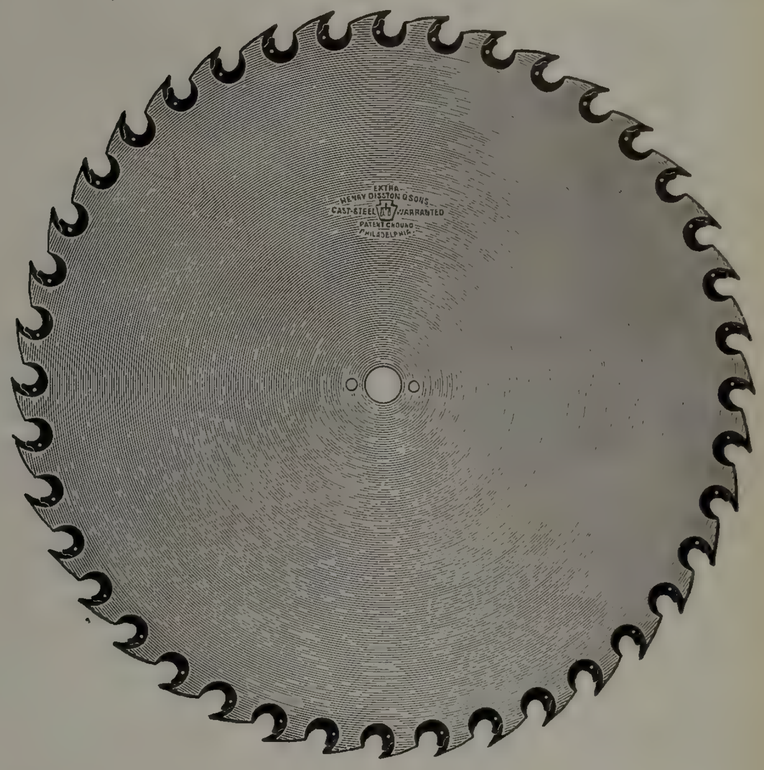
Disston

Saws Tools Files



The tool that is "cheapest in the end" is usually the one that is a little more expensive "in the beginning."

The initial cost of Disston Saws, Tools and Files may be slightly higher than that of the ordinary kind, but Disston lasts longer and is more easily kept in condition, permits faster, more efficient work, and after all, is more economical.

Disston Crucible Steel is exceptionally adapted to making high grade Saws, Tools and Files. Its uniformity and durability, in conjunction with expert shop treatments, have made Disston Tools the best on the market.

Many of the most widely favored types of saws, tools and files have been designed and invented in the Disston works. Disston improvements and innovations have always set the pace, have always led the industry.

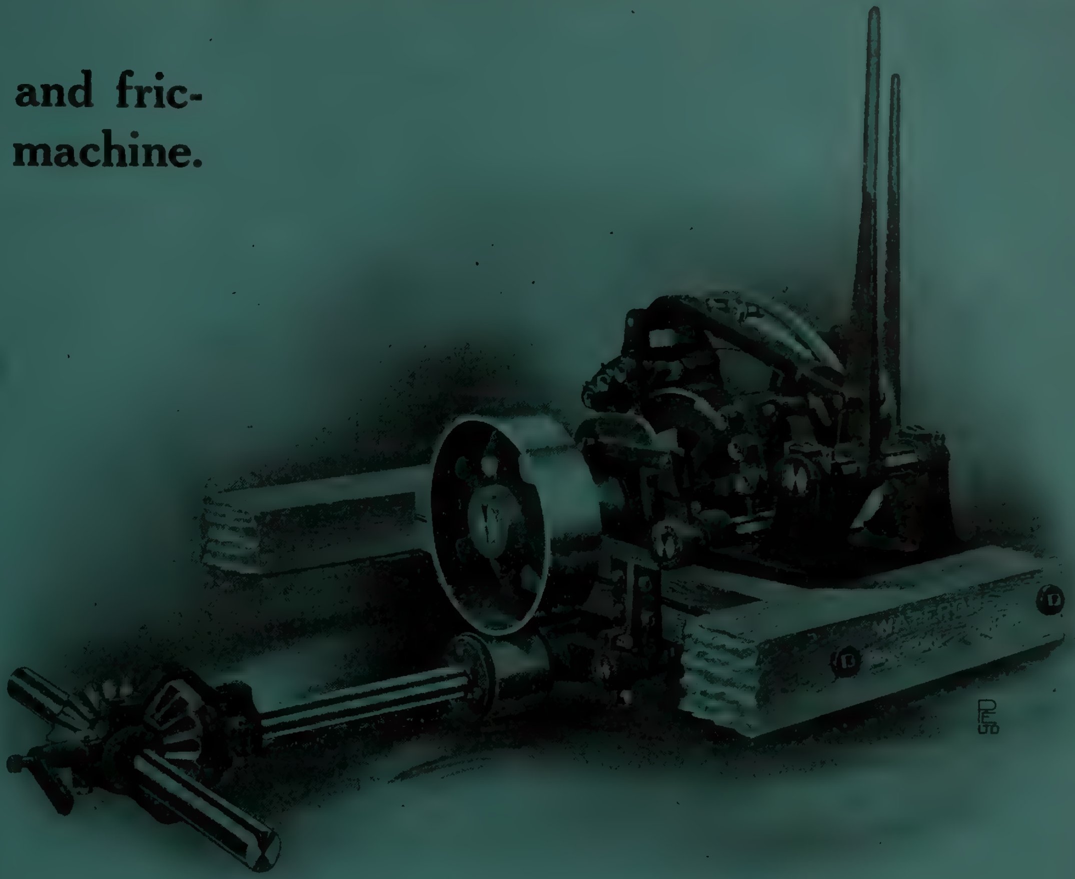
The Waterous Combination Setworks

A setting mechanism and friction receder in one machine. Quick, powerful, safe and absolutely accurate. Can be attached to any rack carriage having set shaft not larger than 2-$\frac{15}{16}$″. Easy on the carriage, easy on the operator and easy on itself.



This Setworks cannot Develop Lost Motion

In the ordinary Setworks the setting lever movement that determines the amount of set is controlled by stop pins placed in a stationary quandrant. As soon as the connections between the lever and the pawl cages become worn, lost motion is bound to develop, and the accuracy of the set is lost.

We overcome this in our Setworks.

The quandrant carrying the stop pins is fastened to one of the pawl cages—on the movement of the setting lever the cages start from the home stop, advance until they strike and then return to the home stop. For the same position on the stop pins the travel of the cages will be the same, no matter how much the connecting links are worn. All wear comes behind the pins and *the absolute accuracy of the set is a permanent feature.*

Other Features

1.—**The friction receder lever** lifts the pawl automatically from the ratchet wheel before receding can commence. This does away with a pawl lifting lever.

2.—**Only two levers are required** for both operations of setting and receding, both are placed most conveniently for the setter, no stooping is necessary. The operator can thus work quickly, accurately and without fear of stripping his ratchet wheel.

3.—**Tool steel pawls** extend full across the 4″ face of wheel, three pawls are carried in each cage, the latter made very wide and open for quick adjustment and to prevent clogging by saw-dust.

4.—**Quandrant is double slotted,** carries our patented knockback pins, arranged to give four standard cuts without shifting.

5.—**Pawls** are arranged to set by 1/32″ up to 3″ at one full throw of lever.

6.—**Every part is made to template,** repairs can be quickly furnished. The setworks can be supplied without receder attachment if desired.

Let us send you our new Carriage catalogue containing full description of this Setworks. Bulletin No. 107.

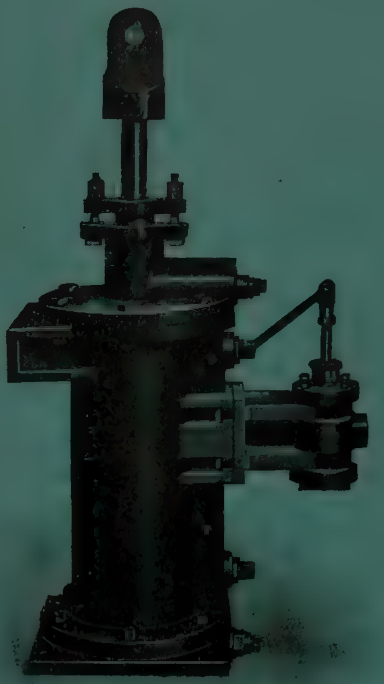
Log Handling Machinery



The cut shows the type of cylinder we have been putting on all our kickers, loaders and canters for over four years. In that time it has been thoroughly tested in many mills and its value has been thoroughly proven.

Notice that all piping between valve and cylinder has been done away with.

Notice also the check valves in head and base of cylinder. These valves cause the steam to cushion in the cylinder at each end of the stroke, thus preventing the piston or the top or bottom head being broken.

The
Grand Triumph
Shingle Machine

is probably the best known horizontal shingle machine made in Canada.

We are the original manufacturers of this machine in Canada and the only manufacturers in this country making the genuine Grand Triumph machine.

It will cut upwards of thirty thousand shingles in ten hours, and it requires for its greatest capacity only ten horse power to run it.

It cuts all of the bolt into shingles—no waste at the end. Send for our catalogue.

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

REDUCE RUNNING EXPENSES

SHIMER CUTTER HEAD

Tools that maintain a uniform shape of pattern, and for an indefinite period, save time—save labor—save running expenses.

THE SHIMER CUTTER

THE SHIMER CUTTER HEADS offer you these several advantages. They furnish a system for making Flooring, Ceiling, Siding, Jointing, Ship Lap, etc., that removes the difficulties incident to the use of every other make of Cutter Head. These tools save actual labor—save machine time—put out a product faultless in form and finish.

The Shimer Cutter Heads are as simple as a saw to keep in order. The set of the Bits for point and edge clearance is a permanent "make-ready" which clears away all friction and protects the cutters from burning and excessive wear.

The Cutters are divided into upper and lower series, parting the chip in the middle of the cut, permitting of a most complete expansion or contraction of the tongue and groove proportions by the turning of a single lock nut. This expansion feature regulates the fitting as close as one-third of a sixty-fourth of an inch. If the Bits are a little dull and you wish to finish the day without sharpening, you can turn the spanner ring one notch to enlarge the groove (or reduce the tongue) when the fitting will again be in perfect shape.

If you wish to reduce running expenses it will pay you to study the advantages offered by the Shimer Cutter Heads. There is nohting like them for Strength—for Reliability—for Fast Cutting—for Quick Adjustment—for all-round work and lasting qualities.

A Band Mill Without a Peer

Best balanced and most symmetrical band mill ever designed

The despair of imitators
Built with 6, 7, 8, 9, 10 and 11 foot wheels
Does not overhang its foundation
Is the heaviest band mill built
Also the perfection of simplicity
It holds all the cutting records
Has the greatest range of top wheel
Double spring cushion tension device
Steam straining engine when specified
Quick opening bottom guides
Bottom guide completely buried in husk frame
Safety upper guide
Steam controlled upper guide when wanted
Steel spoke V section bottom wheel
Chain oiling bearings
Hubs are longer than on any other brand
This insures a very rigid wheel
Wheels tilt from front and rear
The standard of excellence
Every feature original with us
We build every machine required in an up to date mill

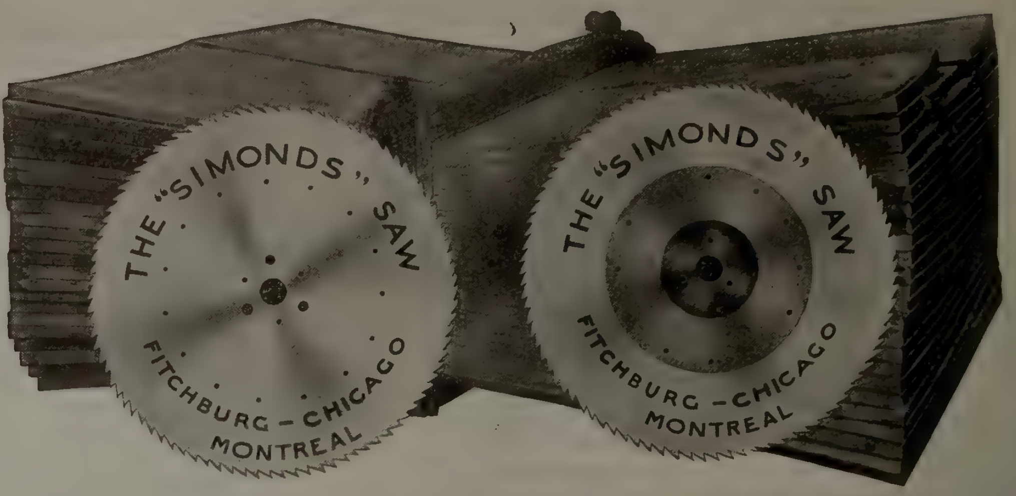
Coaticook, Que.

"I Am Convinced
Simonds Shingle Saws
Have Saved Me Money"



A man bought nine 40-inch Simonds Shingle Saws.
He wanted the best and paid the price.
He knows whether he won or lost on the deal.

A careful record of Shingle Saw cost was kept, with the result that after a few months the record showed, in that mill, the saw cost per thousand shingles cut to be slightly less than one-half of one cent. About 9 cent saw cost for twenty thousand shingles.

That is why this Millman said he was convinced Simonds Saws are **money makers** because they are **cost savers.**

This is a statement of fact. We have the proofs and will gladly show them. If you want low cost use the right saws — Saws made of Simonds Steel, made by Simonds Methods. Dollar for dollar value is given. A saw to sell for less money than the Simonds cannot be as good. It cannot run as economically, and it will not make the same profit for you in the long run.

More shingles mean more money from the same block of wood.

For shingle saw prices and particulars, address our nearest office giving size, number of teeth and guage of saw desired.

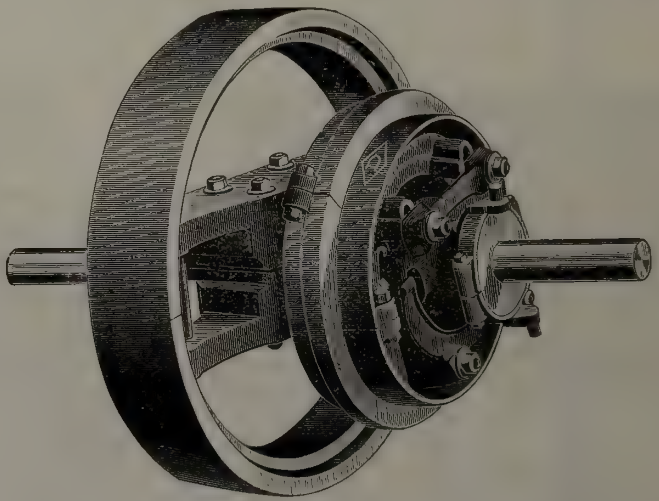
DODGE Split Friction Clutch Pulleys

FOR SAW AND SHINGLE MILLS

POSITIVE - SIMPLE - DURABLE

All parts Interchangeable
Renewable Sleeve
Perfect Balance



Being Split
May be Installed Without
Disturbing Shafting

Made in all Sizes for any Horse Power

Can supply with Wood or Iron Pulleys, and with Babitted or Brass Lined Sleeve.
In successful operation all over Canada. Sold under our fullest guarantee.

Canada, United States and Great Britain, $2.00 per year in advance; other foreign countries embraced in the General Postal Union, $3,00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 **Toronto, August 15, 1911** **No. 16**

The Reciprocity Situation

The passage of the reciprocity bill, by the United States Senate and the approaching elections in Canada, at which the most important subject of discussion will be the reciprocity proposal, brings this question at last into the limelight of public affairs, and makes it the most important political question of the day in Canada. The situation is one which for the lumbermen is full of importance. Although it has been so widely discussed and the features of the proposal have been studied carefully and presented in detail by the press, it will be useful at this stage to present to our readers the exact situation, so far as the duties upon lumber and its products, entering the United States, or Canada, are concerned.

The reciprocity proposals contain four important schedules. Schedule A. includes a list of articles entitled to admission free of duty into either country when imported from the other. Schedule B. states the articles upon which identical rates of duty are to be levied on imports into the United States, or Canada, from the other country. Schedule C. states the articles upon which special rates will be levied by the United States, when these articles are imported from Canada. Schedule D. relates similarly to the duties upon special articles imported from the United States into Canada.

The free list of the two countries according to schedule A., includes the following wood products:—

Timber, hewn, sided or squared otherwise than by sawing, and round timber used for spars or in building wharves.

Sawed boards, planks, deals and other lumber, not further manufactured than sawed.

Paving posts, railroad ties and telephone, trolley, electric light and telegraph poles, of cedar or other woods.

Wooden staves of all kinds not further manufactured than listed or jointed, and stave bolts.

Pickets and palings.

Pulp of wood mechanically ground; pulp of wood, chemical bleached or unbleached; news print paper and other paper, and paper board, manufactured from mechanical wood pulp or from chemical wood pulp, or of which such pulp is the component material of chief value, colored in the pulp, or not colored, and valued at not more than four cents per pound, not including printed or decorated wall paper being the products of Canada, when imported therefrom directly into the United States, shall be admitted free of duty, on the condition precedent that no export duty, export license fee, or other export charge of any kind whatsoever (whether in the form of additional charge or license fee or otherwise) or any prohibition or restriction in any way of the exportation (whether by law, order, regulation, contractual relation or otherwise, directly or indirectly) shall have been imposed upon such paper, board or wood pulp, or the wood used in the manufacture of such paper, board or wood pulp, or the wood pulp used in the manufacture of such paper or board.

In connection with this schedule the removal of all duties will apply immediately upon the acceptance of the pact, by both countries, except in the case of pulpwood, paper board, news print, and other paper. The free interchange of such paper and pulp can only take place under conditions which at present seem practically impossible of realization. In schedule C. the duties on lath, shingles, and finished lumber, when imported into the United States are provided as follows:—Laths 10c a thousand; shingles 30c a thousand; sawed boards, planks, deals, and other lumber, finished one side, 50c per M. ft.; finished one side, tongued and grooved, or finished two sides, 75c per M. ft.; finished three sides, or two sides and tongued and grooved, 1.12½c per M. ft.; finished four sides, 1.50 per M. ft.

The duty upon finished lumber coming into Canada from the United States is not affected by the reciprocity proposals, but remains on an ad valorum basis of 25 per cent. This applies however, only to lumber which has been planed or dressed on one, or both sides, and tongued and grooved, or jointed. Lumber dressed on one side only, and not further manufactured enters Canada free of duty.

Wide spread complaint is made among United States manufacturers of lumber because of the apparent removal of so much of their duty upon lumber, while so little is removed by Canada. The fact remains however, that upon rough lumber which is the most important item of international trade in lumber, there will be no duty in either country if the reciprocity proposal becomes effective. Canada for a long time has admitted United States rough lumber free of duty, so long as it is not dressed on more than one side. It seems unreasonable therefore that so much objection should be made by manufacturers in the United States to free rough lumber from Canada. In regard to the duty upon dressed lumber the advantage apparently is with Canada, inasmuch as the duty is on an ad valorum basis of 25 per cent, on any lumber which is dressed on more than one side. This duty of course would in the great majority of cases be much greater than the specific duty upon Canadian dressed lumber, entering the United States, which varies from 50c to $1.50 a thousand feet. On the other hand however, it must be remembered that under the reciprocity proposals, lumber planed or finished on one side, and not further manufactured is to enter Canada free of duty, whereas it must pay a duty of 50c per thousand feet when entering the United States.

Statistics of the trade in lumber, between Canada and the United States for the fiscal year ending March 31 last, show that the exports of lumber from United States to Canada during this year, increased in value by $5,573,521, which amounted to an increase of over 50 per cent., as compared with the year previous. The exports of deals, planks, and boards, joists and scantling, from the United States to Canada during the year were valued at $8,328,728 and the exports of logs, timber, ties, etc., from the United States to Canada were valued at $1,717,020. On the other hand the exports of lumber from Canada to the United States, for the 11 months ending with May, show a considerable decrease for

1911, as compared with 1910. The total for 1911 was $14,247,615, and for 1910, $17,152,739. These statistics reflected rather forcibly the economic conditions prevailing in the two countries, during recent months. The lumber trade in the United States has been notoriously bad, for a matter of several years, whereas in Canada conditions have improved during the last year or two to such an extent that the lumber trade has felt the benefit materially. It is not surprising therefore, to note that Canada's purchases of lumber have increased and that her sales of lumber to the United States have decreased. The indication is, that Canada's own consuming capacity is taking care of a much greater percentage of the output of Canadian mills. It is a natural outcome moreover, with the conditions prevailing in the United States, that the manufacturers of that country have been enlarging their trade in Canada. They have found it so difficult to dispose of their large overproduction, in their own markets, that they have naturally turned to the Canadian markets, and disposed of large amounts of lumber, sometimes even at a considerable loss.

What are Your Views on Inspection and Grading

The letters which have recently appeared in the Canada Lumberman upon the question of appointing a board of authorized inspectors to handle the disputes which so often occur in the lumber trade about grading, and the question also, of the drawing up of a definite set of grading rules to regulate the trade in certain parts of the country where there are not as yet any such rules in use, have resulted in a general interest being awakened in the possibility of inaugurating such a change. More particularly has this been the case among the trade in Ontario, where the disputes are unfortunately of frequent occurrence and where there is the most remarkable chaos upon these points. It is scarcely credible to those who are not in the trade in Ontario, that such an extensive trade could have got along so long without having put into effect some such solution of the difficulty as the one which has been suggested, and which has met with such general approval on the part of those who have written to the Canada Lumberman upon the subject.

The approval of a few dozen prominent members of the trade is a pretty good indication that the difficulty is one which requires to be removed. It would not be practical however, to conclude on such evidence alone that the whole trade desires the change and a further step will shortly be taken to secure a more wide-spread expression of opinion from the trade at large. With this end in view, those who have been active in promoting the movement so far, will prepare a pamphlet containing a reprint of all that has appeared in the Canada Lumberman upon the subject to date and will address it to a large number of the trade throughout Ontario. Manufacturers, wholesalers and retailers alike will be addressed and it is to be hoped that they will give the matter careful study and be prepared to express their opinions in letters to the Canada Lumberman. If it is found after a careful attempt to sound the lumber trade and industry that there is a strong opinion in favor of a movement of this nature the matter will resolve itself into the holding of a meeting to be attended by all branches of the trade, at which, ways and means of putting it into effect can be discussed and decided upon. The pamphlet which it is proposed to issue will not be prepared until the National Exhibition at Toronto and the Dominion elections have passed. It is believed that by delaying until the end of September a more representative expression of opinion can be secured. In the meantime however, the question will be studied carefully by those who have taken the matter up. It will help in reaching an early settlement of the question if others will write to the Canada Lumberman in the interval, expressing their views.

Those who are seeking to bring about the change, point out first of all that in reality very little change will be necessary. The matter resolves itself very largely into one of getting the members of the trade to stand together and decide that in future they will agree to submit their disputes to an impartial board of inspectors. So far as the grading customs are concerned there will be little or no change necessary. The grading systems which are in use by most of the large manufacturers in Ontario to-day are based generally upon identical principles. These principles will be arranged into definite rules which will specify the sizes of knots to be permitted in various grades and widths. When the manufacturing trade in general realize that there will be nothing serious involved in the matter of submitting to outside inspection, it is felt that they will readily fall in line.

So far as the retailer and the wholesaler are concerned there is everything to be gained by such a plan. It is felt that those who would not fall in with it would not have the interest of the trade at heart, and that among them could be found most of the men who have been so much harm to the trade in the past. The plan has been worked so satisfactorily in the United States and also to some extent in Western Canada that there should not be any difficulty in putting it into operation in other parts of Canada, if the members of the trade will support the movement. Readers of the Canada Lumberman are earnestly requested to send in their views upon the proposal and also to watch for the circulars which will be sent out about the end of next month placing the matter definitely before them. The more expressions of opinion that can be secured upon the subject the more definitely will it be possible to approach the matter intelligently and to make sure of success if it is to be carried into effect.

Factors in the Success of Timber Salesmen

The difference between a travelling man and a salesman is like the difference between a high grade of lumber and a mill cull. On the high grade, the manufacturer will probably make handsome profits. On the mill cull he runs a splendid chance of losing money. So it is with men. The travelling man who is not cut out for a salesman or who does not apply his natural ability effectively is a source of possible loss to his employer. The difficulty of finding good salesmen has ever been prominent in the lumber business. It is the subject of endless discussion in offices and in trade journals. One seldom however, finds such practical advice upon the matter of salesmanship as was given recently by a large lumber jobbing house in a letter to its employees. The letter was published in the "Hardwood Record" and for the advantage of our readers we reproduce it as follows:—

"It is an old adage that success doesn't come from never making mistakes, but it does come from not duplicating them. We would much prefer to support a man who makes strenuous efforts to accomplish what he starts out to undertake and makes some mistakes, and then profits by them, than to support a man who makes little effort, no mistakes and no success.

"Remember that the best fruit tree, planted in the best soil and not cultivated, raises the poorest fruit. Let's watch ourselves carefully and weed out unsatisfactory customers, unsatisfactory orders and unprofitable habits that we may acquire. Impress upon yourselves and your customers that there is an unwritten law in our business that if our loading crews do not load according to instructions and contract, through error or carelessness, and our lumber cannot make good, when the facts are called to our attention, we do make good.

"Let us see if we cannot improve our efficiency. Let us keep in mind that many of our duties are of a persuasive and executive character, and it is the man with the spurt at the right moment (based on his knowing his business every inch of the way) that wins the race. We are not complaining of the work done by any of our employees, but ask you to keep in mind the idea of increasing your efficiency. There is no patent on lumber buying and selling, save hard, intelligent and efficient work, and the success of our big winners in the business has been brought about by close and thoughtful application to duty. However, it is well to remember that the man who does not stop to rest his brain occasionally from grinding duty is like the carpenter who never interrupts his work long enough to grind his tools. Such a carpenter is a poor workman, and such a salesman is not of the best kind.

"An analysis of competent salesmanship would show perhaps that sixty-five per cent. of effort should be devoted to the handling of human nature, twenty per cent. to the actual handling of material and fifteen per cent. to mechanical ends. It should also be recalled that no two customers can be handled in exactly the same way. Consult their various tastes, notions and idiosyncrasies. Defer to the individual customer's likes and dislikes, notwithstanding the fact that they may vary as much as the style of women's hats in a millinery store. Especially bear in mind that in handling human nature, sugar catches more flies than vinegar.

"Let's get down to some brass-tack facts about our own business; In the district in which we operate the forest shows fifty per cent. of oak, twenty-five per cent. poplar and twenty-five per cent. of other hardwoods. These woods produce on the average of about fifteen per cent. firsts and seconds, twenty-five per cent. No. 1 common and sixty per cent. No. 2 common and poorer. Our order book shows that we are selling about sixty-five per cent. of other woods than poplar and oak. In our oak transactions we are selling largely firsts and seconds, construction oak and mill culls. In poplar we are selling special grade like box boards, panel and No. 1—then No. 3 common. We should sell lumber more proportionate to actual production. We should sell more No. 1 and No. 2 common in regular standard grades.

"We are going to venture a suggestion to our employees that if lived up to, we think will be beneficial to our business; If employees will direct and confine their main energies, thoughts and arguments towards the buying of good lumber at a minimum price, and selling it at the maximum price consistent with quality, and towards the handling of people and materials, and the careful correction of mistakes, they will increase their earning powers and the earning power of the company, without any extra work whatsoever. Therefore if employees will keep thmselves in such spirits that when cars or customers go wrong—when they get stuck in the mud—they will put their shoulders to the wheel and pull themselves out, instead of spending nerve and brain force fussing and complaining, they will accomplish more and add to their earning capacity. Take out of your dictionary the word 'can't,' and resolve than when you come to a hard piece of road you will pull harder and steadier until you again get on to a good turnpike.

"Remember there is absolutely no money in not making any mistakes. The making of a mistake is a good investment, provided you take to yourself the benefit of the blunder and never repeat it. Simply see that your good transactions overbalance those caused by mistakes. Therefore bear in mind that tactful and honest statements of facts accomplish more than nagging criticism and misstatements.

"We are ambitious to build up a reputation of knowing our business in every detail, and of being competent to handle the total hardwood requirements of our customers, and living up to our contracts, and dealing on a fair and square basis with the people with whom we trade. Therefore we are not only willing but anxious, when things go wrong, to put our energies to setting them straight. We want the confidence of both the people from whom we buy and to whom we sell, and the only way to gain this end is to be worthy of it."

Editorial Short Lengths for Busy Readers

The unlimited use of water is indulged in at the Canadian Western Lumber Company's plant at New Westminster, B.C., for several peculiar purposes. The tug Senator Jansen, which is equipped with powerful hydrants, has lately been use to drench the mills, wharf and timber. The principal object is to reduce the risk of fire during the hot weather. The second is to make it cooler for those who are at work at the mill, and the third, though by no means least important object, is to wipe out the army of mosquitoes which sometimes make it almost impossible to work.

The first gangs of the season were sent to the shanties from Ottawa late in July. Labor is the scarcest for many years. The call for 50,000 harvesters for the West has taken a large number of unemployed from the district. Local farmers are also scouring the city for help, and offering $1.75 a day and board. Railway contractors offer $2.25 per day, and the civic corporation of Ottawa cannot secure enough help at $2 a day of nine hours. Now that employment agents have received the first orders for bush hands the outlook is perplexing. The lumber and pulp industry will be favored by the fact that a great proportion of the common labor available have a preference for shanty work.

A Montreal weekly publication points out that during the month of July six new paper manufacturing companies were incorporated in Canada with a capital of more than $11,500,000, while eleven other companies with a total capital of three and a half millions vastly increased their stock. According to recent statistics our exports of manufactured news print show a decided increase of late, while our imports of pulpwood are considerably less. This means that more raw pulp wood is being manufactured in Canada and less exported. Another interesting feature is that the cost of pulpwood has increased at the point of shipment from $5.98 per cord in 1909 to $6.34 in 1910 and is still a few cents higher this year. Canada is becoming more and more a manufacturing centre in this line, and, if she has sense enough not to hand over her raw materials to the United States, there is no reason why her mills should not compete seriously with those in the States, and eventually capture most of the paper trade on this continent. She has the wood, the water power and the labor necessary to make her the leading manufacturing country.

The futility of trying to regulate by tariff restrictions, the trade in any article which is essential to the commercial progress of a country, and of which they have not a sufficient natural supply, is forcibly shown by a fact which has been brought to light in connection with the removal of the duty on cheap news print paper entering the United States, when it has been manufactured from pulp wood grown on private lands in Canada. Formerly this paper or the pulp from which it would be manufactured, had to pay a duty when entering the United States. The duty would have prevented any trade had other things been equal, but this was not the case. The freight on paper from Windsor Mills, Que., to Cincinnati was 16 cents, and the freight rate to Toronto was 18 cents, in spite of the fact that the paper going to Cincinnati passed through Toronto. They need our products so badly in the United States that it is only a matter of a little while before their enterprising merchants and industrial captains will insist upon the removal of unnatural restrictions and will be doing their best to stimulate international trade.

White Pine Lumber Company—Dumping Logs into Pond.

White Pine Lumber Company—View of Mill and Log Convevor.

Important Sawmills of Northern Shore

No. 4.—The White Pine Lumber Company's Well Equipped Plant at Blind River—Description of Its Mill and Operations

BLIND River, Ont., is one of the numerous thriving towns dotted along the North Shore of Lake Huron, which owe so much to the lumber industry for their growth and activity. Two important lumber companies have their mills at Blind River. One of these, the White Pine Lumber Company, is the subject of the present article. The other company, Eddy Brothers and Company, Limited, will be described in a later issue.

The site of the White Pine Lumber Company's plant is one upon which there has been a mill for nearly three quarters of a century. In the early days, the lumber which the mill cut, was all secured from the country bordering upon the Blind River. This has been changed, however, and a large percentage of the lumber which is now sawed at the mill of the White Pine Lumber Company comes from the township of Gough, and back of Webbwood and has to be brought to Blind River by way of Georgian Bay. This has rendered necessary the construction of a long mechanical conveyor which is a unique feature of the company's plant. Formerly the logs were taken direct out of the river as they came down it. Now many of the logs have to be conveyed over a hundred and seventy-five yards by the mechanical conveyor which takes them also over the dam from which the water power was formerly secured for the mill. The conveyor consists of an endless chain running in a trough somewhat similar in construction to that of an ordinary jack ladder. A great many logs have also to be driven out of the Blind River each year. In order to run the mill while they are sluicing through the dam, the White Pine Lumber Company's logs are carried over the main channel of the river into their own boom. The logs as they reach the end of the mechanical conveyor are dumped upon an inclined platform from which they roll one at a time into the company's log pond, which is situated in the Blind River above the dam. The Blind River itself runs between the mill and the boiler house, a feature which commends itself highly to insurance companies.

The officers of the White Pine Lumber Company are as follows:—J. W. Wells, Menominee, Mich., president; Daniel Wells, Detroit, Mich., vice-president; A. C. Wells, Menominee, Mich., secretary, and R. W. Wells, Blind River, treasurer and general manager.

Originally the mill was constructed as a shingle mill. Subsequently it was decided to cut lumber, and a circular saw was installed. The Michigan Land and Lumber Company took over the mill in 1905 and increased its capacity by putting in a band saw opposite the circular and also by installing a vertical resaw. Between 1905 and 1907 the mill passed through different hands and finally came into the possession of the present owners in 1907. They took out the vertical resaw and put in a gang saw and a horizontal slab resaw. In place of the water power which formerly operated the mill it is now driven by a 500 horse power engine, six feet in diameter by 16 feet long, which is furnished with steam by a battery of 7 boilers, equipped with hot blast grates, manufactured by the E. Long Co., Orillia, Ont. The water power is still utilized for several purposes. It supplies energy for a motor which runs the fans for the hot blast grates. A second motor, run by water power, is used for hauling in the logs from the foot of the jack ladder and a similar power is used for propelling the conveyor running to the fire room. All the cutting machinery is propelled by steam power.

White Pine Lumber Company—A scene at the Shipping Docks.

The piling and shipping capacity of the White Pine Lumber Co. is exceptionally good. What with their splendid docks and their railroad yard they can accommodate 17,000,000 feet of lumber. At their docks they have a depth of water, which enables them to load practically any boat engaged in the lumber trade. Nearly all of the company's cut is disposed of in the markets of the United States. They are making plans however, for developing a Canadian trade during the coming winter, when they expect to dispose of about 2,000,000 feet of lumber by rail shipments, in Southern Ontario and United States points to the south of Southern Ontario. In addition to their large output of lumber the White Pine Lumber Company are also in a position to furnish moulding, flooring, etc.

White Pine Lumber Company—Logging Engine with Train.

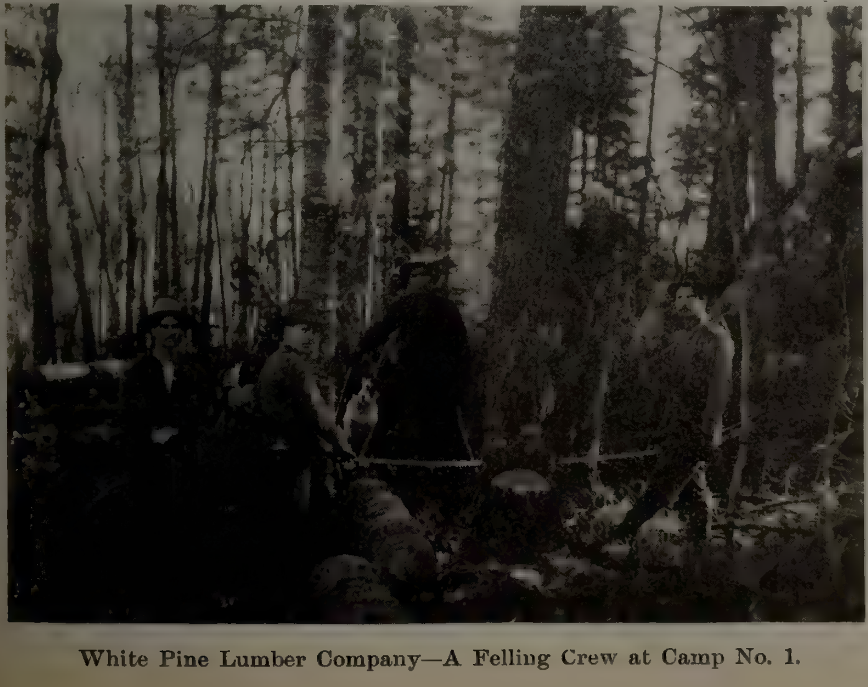
White Pine Lumber Company—Loading Logs on to Cars.

for the general trade, as they operate in addition to the mill, a small planing mill which turns out a splendid class of product.

The same energetic management and development of the capabilities of the business which have characterized the work of the company in connection with the saw mill have been strongly in evidence in the woods operations. They have adopted modern methods of logging, more completely perhaps, than most of the other companies in their district. One of the features of their logging work has been the construction of a logging railroad in the woods. They have seven miles of steel rails and the equipment of the road includes two locomotives, (one Shay type and one Porter type), and twenty-five logging cars. The railway runs from one of the company's camps to the river and also hauls logs into a large lake where they are dumped and from which there is a drive of only three miles to the Spanish River. Out of this creek the company have already driven twenty-five million feet of lumber. This useful little line of railway is located on limit 117. By its means the company are able to continue their logging operations throughout the summer, thus keeping their outfit working all the year round and avoiding the keeping of idle horses during the summer months. They are thus enabled to get their logs to the mills and saw them and get their money out of them during the summer, a consideration of the greatest importance in the conduct of a lumbering business. The railway is, in fact, operating very satisfactorily and in addition to the advantages already mentioned for it, it saves the company a large amount of money on long hauls. Last winter, when being operated on a six or seven mile haul, it did the work of about thirty teams. During the summer of 1910 the company built six miles of railroad grade at an average cost of $800 a mile, which is very little in excess of what a good sleighing road would cost. Some sleigh roads in fact cost more than this. Another feature of the railroad, as a logging factor, is the fact that it enables the company to get out a much greater quantity of logs per camp than would be possible under other conditions. With no more than three camps the company take out each year from 15,000,000 to 16,000,000 feet of logs. Railroading in a timber limit would not of course be feasible under all conditions. It requires especially, that the country should be fairly level. This condition is fulfilled in the limit of the White Pine Lumber Company upon which they log by railroad. In a distance of 15 miles of road there is no grade over 4 per cent.

One of the illustrations accompanying this article shows one of the improvements which facilitate the logging operation of the White Pine Lumber Company. The log chute shown is 400 feet long and has a drop of 63 feet. Another similar improvement which is located higher up the river has a length of 500 feet and a drop of 62 feet.

The mill operations and the woods end of the work are looked after by Mr. R. W. Wells from Blind River. The United States end of the company is known as the J. W. Wells Lumber Company of Menominee, Mich. The mill operated by the company at Menominee was destroyed by fire a couple of years ago and they are now building a large new mill of steel and concrete which is to be equipped with about the same variety of machinery as that at the Blind River mill, with the exception that instead of a circular a band saw will be installed. It will also include a shingle and a cordwood mill. The equipment of the Blind River mill consists of one single cutting Waterous band, one circular, a 52-inch Wickes gang, and horizontal resaws manufactured by the Diamond Iron Works of Minneapolis. The output of the mill is 135,000 feet in a ten-hour day. The lath mill which is run in connection with the saw mill cuts about 40,000 pieces a day. The company is at present operating on two limits; No. 117 in the township of Gough, back of Webbwood, and No. 167, which is



White Pine Lumber Company—A Felling Crew at Camp No. 1.

White Pine Lumber Company—Log Chute 400 ft. long with 63 ft. drop.

tributary to the mill on the Blind River. Upon these limits they have over 100,000,000 feet of timber still left standing.

Mr. J. W. Wells of Menominee, Mich., is also interested in the Girard Lumber Company at Dunbar, Wis., which cuts some 70,000,000 feet of lumber per year. Another company in which Mr. J. W. Wells is interested is the Bird and Wells Lumber Company of Wausaukee, Wis., which cuts about 40,000,000 feet per year. Both these mills are operated night and day the year round. At the Menominee mill the company operate a large hardwood flooring factory where they manufacture the celebrated Wells Diamond Hard Maple flooring. The new mill which is being erected at this place will supply the flooring factory with lumber.

Since the above description of the company's operations was written the White Pine Lumber Company have decided not to operate any logging camps during the coming winter. They will, however, haul some logs for another company with their railway.

Cost of Cooperage Manufacturing

Description of Accurate Inventory and Cost Accounting System—Analysis of Factors Contributing to the Expense

At the recent meeting of the National Coopers Association at Chicago, an interesting feature of the programme was the reading of a couple of letters upon the costs of cooperage manufacturing. One of these letters was from Frederick J. Koster, President of the California Barrel Company, and read as follows:—

"We have developed, as a result of much study, and with the assistance of experts at considerable expense, a very accurate inventory and cost accounting system.

"The aggregate of our business comprises a great variety of packages, necessitating the creation of certain departments, namely, tight barrel department, keg department, slack cooperage department, pail and kit department.

"In conjunction with the International Time Recorder system of keeping the total daily time of each of our employees, daily crew work cards report the operations at each distinctive crew, as for instance, the raw material receiving and supplying crew, the manufacturing crew in each department, the testing crew, and so on, showing the exact time of each item of work engaged upon during the day.

The overhead expense applicable to each item of material received, and to each item of production, is divided into two separate heads; namely, 'Direct Department Expense,' under which is charged a proper proportion of the items of rent, insurance, taxes, depreciation, maintenance and repairs, supplies and miscellaneous, and 'Factory General Expenses,' under which is charged the proper proportion of those items already enumerated under the heading of 'Direct Department Expense,' and in addition thereto, a proportion of administrative and office salaries, wages of mechanics, engineers and watchmen, telephone and telegrams, stationery and office supplies, fuel, oil, light and water.

"The apportionment is made to the departments in accordance with the amount of floor space each occupies, and the investment that each must carry in machinery and all appliances, as well as in stocks of raw and manufactured material, etc. The apportionment to "Factory General' being that which cannot reasonably be considered as applicable to any of the departments solely, but which is a burden upon them all.

"With this preliminary outline of our general scheme we proceed to indicate as nearly as possible in proper order, our method of finding the actual cost of our products. We begin with raw material, which includes cost, freight, plus carload switching, or drayage, receiving, namely, the actual cost of placing goods into our warehouses, plus a proportion (on a work hour basis) of factory general expense. This gives us the actual cost of each item of the raw material laid down in our warehouses.

"Production of manufactured ware includes actual labor supplying raw material to each department; manufacturing throughout the various processes in each department; warehousing—namely, placing manufactured goods into warehouses; direct department and factory general expense. The actual material consumed and labor applied in the production of each article is accurately recorded.

"We are about to make a run, for instance, on a certain size package. A work order is made out by the superintendent showing the kind of package to be manufactured; in which department to be produced; the size and kind of stock (namely, staves, heading, hoops, etc.) to be used, and from then on a daily report is rendered on the crew card of the number manufactured, the actual breakage of staves, heads and hoops, and the actual number of hours applied by each of the various employees engaged upon the work.

"At the completion of the work order there are shown the following actual items of cost: Staves, heads, hoops, sundries (which include rivets, or whatever the minor items might be, depending upon the character of the package made); actual labor cost, and in addition to these items, direct department expense and factory general expenses, based upon the number of work hours applied in the manufacture of this particular run of packages.

"Thus we arrive at the actual cost of our manufactured ware, ready for sale and delivery, subject, however, to such further special preparation as may be indicated by the customers when ordering, viz.: varnishing, giving an interior coat of paraffine or glue, or such other requirements with which the cooperage trade generally is familiar.

"This brings us down to an accurate cost of each item we sell, right up to the point of readiness for delivery to cars or drays, and this we consider cost, affected only by overhead, distributive over the entire volume of business transacted, and which comes under the following general headings: 'Selling expenses,' embodying such items as delivery labor; cartage; salesmen's salaries; salesmen's expenses; commission, and advertising.

"'Administrative expenses,' covering such administrative salaries, as not already charged under 'factory general;' director's fees; travelling expenses, and entertainment.

"'General expenses,' comprising collection and exchange; estimated losses; legal expense; postage; sundry office expenses; office salaries; stationery and office supplies; subscriptions and donations; telephone and telegraph, etc.

"Under the headings of 'Sundry Gains' and "Sundry Losses' occur the following: Under the former, discounts on purchases, commissions earned, and sales of goods not manufactured by us; under the latter, discounts allowed; allowances to customers, etc.

"This gives you a general outline; in fact, it is possible that I have gone somewhat too minutely into the details of our method of ascertaining costs.

"We permit no guesswork. We have long ago learned that it is unsafe to attempt to do business on guesswork.

"To summarize, we ascertain accurately the cost of our raw material laid down in warehouse; then we ascertain accurately the material (including waste and breakage), and all labor entering into the cost of manufacture, and handling at every point; and finally, as nearly accurately as such a thing is possible, the proportion of all overhead that east item should bear.

Another letter upon the same subject, from M. D. Welsh, of the Omaha Cooperage Company, was also read to the members. It read as follows:—

"Many manufacturers cheat themselves into the belief that their cooperage costs less than it actually does. I have seen men figure out their cost about as follows:

One set oil staves	$ .54
One set heads	.22
Nine-pound steel	.18
Shop pay-roll per barrel	.16
Total cost	$1.10

"The above four items constitute only the base cost of a barrel. To the above should be added proportionately twenty-five more items.

The 25 items consist of the following:
Salary of owner or owners, or officers if incorporated.
Salaries of office employees.
Fire insurance.
Taxes of all kinds.
Rents, if any.
Blank books.
Stationery.
Postage stamps.
Telegraph tolls.
Telephone rental and tolls.
Interest and exchange.
Charity.
Travelling expenses.
Social expenses at meeting and conventions.
Coke.
Water.
Oil
Waste.
Repairs.
Attorney fees.
Benevolence.
Coal.
Depreciation on machinery and building from wear and tear.
Cost of delivery of barrels to purchaser. If done by team the cost of feed for horses, repairs to wagons, harness and shoeing horses added.
Interest at 6 per cent. actual cash invested over all liabilities.

"If a manufacturer will foot up his cost for the last twelve months of the above items and divide into that sum the number of barrels he has made during that period he will find from 12 to 16 cents must be added to the base cost of $1.10 for raw material and shop pay-roll.

"I am unable to understand how a person can deceive himself as to the cost of his product by not adding all of his overhead charges. Yet it is being done by large as well as small concerns, and so long as cooperage manufacturers will not get together and discuss this cost problem and other items of practical and vital importance to each other I do not see any immediate or lasting prosperity in the cooperage business."

Canadian Lumber in South Africa

Increasing Demand for White Pine and Spruce—Comparative Statement of Trade in 1910 and 1909

The trade returns recently issued by the Department of Commerce and Industries, indicate an appreciable advance in the volume and value of the importations of lumber into British South Africa, during the fiscal year 1910.

The imports of unmanufactured wood and timber totalled 15,680,147 cubic feet, valued at £962,180, as compared with 9,168,416 cubic feet, valued at £499,302 for the corresponding period of the previous year, or an increase of 6,511,731 cubic feet, valued at £462,878.

There were in addition importations of manufactured wood valued at £219,986, as against £158,936 for the similar period of 1909, or an increase of £61,050, showing an expansion of £523,928 in the value of imported wood goods, exclusive of furniture, during the year 1910.

The totals for the two years are given for comparison as follows:

	Wood Unmanufactured Value	Wood Manufactured Value	Total Value
1909...	£499,302	£158,936	£ 658,238
1910	962,180	219,986	1,182,166

	1910	1909	1910 Increase	1910 Decrease
Wood, unmanfactured—				
Hickory	42		42	
Oak	52		52	
Spruce and pine	74,366	21,778	52,588	
Poplar	146		146	
All other n.o.d.	4,503		4,503	
Flooring and ceiling	1,741	2,410		669
Wood, planed and grooved	14,603	6,442	8,161	
Wood, manufactured—				
Casks, empty	4	5		1
Wooden boxes, empty	392	359	33	
Handles for picks, etc. ...	450	828		378
Houses and frames of houses	103	407		304
Staves	1,516		1,516	
All other, n.o.d.	2,249	1,909	340	
Wood pulp or wool	195		195	
	£100,362	£34,138	£67,576	1,352
	34,138		1,352	
Increase	£ 66,224		£66,224	

Value of South African Imports of Canadian Lumber

The following is a comparative statement of the value of unmanufactured wood and timber, and manufactured wood, imported from Canada during the fiscal years 1909 and 1910, showing increase or decrease:

Marked Increase in Several Items

The foregoing statement shows a substantial increase of £66,224 ($331,120) in the value of the lumber imported from Canada during the year 1910, as compared with the previous year. The imports of spruce and pine were larger by £52,588 ($262,940); hickory £42 ($210); oak £52 ($260); poplar £146 ($730): All other n.o.d. £4,503 ($22,515); wood, planed and grooved £8,161 ($40,805); wooden boxes empty, £33 ($165); staves £1,516 ($7,580); wood pulp or wood, £195 ($975); all other n.o.d. £340 ($1,700). The imports of casks, empty, were smaller by £1 ($5); flooring and ceiling £669 ($3,345); houses and frames of houses £304 ($1,520); and handles for picks, etc., £378 ($1,890).

Inadequate Statistics

The trade returns do not show separately the quantity or value of the imports either of spruce or pine, both being included in the returns under the heading of pine. It is therefore impossible to accurately determine the quantity or value of the imports of either of these woods. The figures, however, indicate that the importations of spruce and pine together totalled 11,166,556 cubic feet, valued at £621,666 ($3,108,330), about fifty per cent. of the whole quantity being imported from Sweden.

Increased Imports of Canadian Spruce and Pine

The importations of lumber from Canada, especially spruce deals, spruce deal ends, pine deals, planks, boards and timber, have been steadily increasing during the past three years, and the possibilities for further expansion are favorable. This will to some extent depend upon the ability of Canadian manufacturers and exporters to fully meet the requirements of the market at competitive prices, and also upon the care that is taken to ensure that all orders are properly executed, as it is absolutely necessary that the quality and dimensions of the material should strictly comply with the specifications.

Large and Important Market for Lumber

The market in South Africa for the various classes of wood and timber in question is large and important, and is wholly supplied by importations from oversea countries.

The quantity of spruce and pine imported from Canada during the year 1910 was 1,369,714 cubic feet, valued at £74,366 ($371,830), or about twelve per cent. of the total imports.

Sweden, Norway, and the United States, are Canada's chief competitors in the timber market of South Africa. These, however, being foreign nations, their exports of wood and timber to this country are subject to an ad valorem duty of three per cent., while the imports of lumber from Canada enter South Africa under the preferential tariff free of duty. This advantage in the tariff should be a great stimulus to the lumber trade of the Dominion and a strong inducement to Canadian exporters to carefully consider the requirements of the market and assiduously cultivate South African business, as there is no reason why Canada should not have a very large share of the wood and timber trade of this country.

Imports of Spruce Deal Ends from Canada

The spruce deal ends are chiefly used in the manufacture of boxes and cases of various kinds and sizes, for the South African market. This material evidently meets the requirements of the trade as the demand for it is constantly growing. The manufacture of boxes is now an important industry in Cape Town. Two large planing mills, well equipped with modern plant for box making, have been successfully operated during the past three or four years, a considerable number of hands being steadily employed throughout the year manufacturing boxes for fresh and dried fruit, candles, soap, biscuits, jams, sweets, fish, explosives, and various other commodities for which wooden boxes and cases are required.

The proprietors of these mills imported from Canada, during the year 1910, about two thousand standards of spruce deal ends for boxmaking and other uses in their business.

Imports of Spruce Deals

The Canadian spruce deals imported into South Africa are largely used in buildings for joists, studding, and scantling. The sizes required are 3 in. x 9 in., 3 in. x 10 in., 3 in. x 11 in., 3 in. x 12 in., and from 10 feet to 30 feet in length, 3 in. x 9 in. being the size in most demand. The grades are known as Nos. 1, 2, 3 and 4. Grade No. 1 would be called merchantable in Canada.

Several timber merchants own and operate mills where deals are cut into sizes suitable for scantling, studding, and roofing timbers. Enquiry has recently been made for a good quality of spruce boards, 1 in. thick and 12 in. wide and up, and from 12 feet long to 18 ft. long for shelving. Hitherto pine has been exclusively used for this purpose.

Douglas Fir or Oregon Pine

There is a good market in South Africa for Douglas Fir, known here as Oregon Pine. It is rough sawn and graded as first, second, third and fourth quality; as far as can be ascertained very little, if any, of the fourth grade is brought into the country. This timber is imported in various sizes as follows:—3 in. x 9 in., 3 in. x 12 in., 4 in. x 6 in., 4 in. x 9 in., 4 in. x 12 in., 6 in. x 6 in., 6 in. x 9 in., 6 in. x 12 in., 9 in. x 12 in., 12 in. x 12 in., (of any lengths varying from 10 to 30 feet.) It is however stated by Timber Merchants that the greater part of the import is 3 in. x 9 in.

The better quality of this lumber is used for the inside finish of dwelling houses. The second grade is planed, tongued and grooved, and used for ceilings, walls and flooring of buildings generally. Shelving and other fittings for stores and shops, joists, scantlings, and roofing timber are also made of this wood and it is very largely used in building and general carpentry.

Southern Hard Pine

The Southern hard pine timber (pitch pine) imported from the United States is largely used by the various mining companies in the construction of the requisite framework of timber to carry the machinery on the pit heads and the conveyors connected therewith. It is also manufactured into tongued and grooved flooring and is much used in general carpentry. This timber is sawn in various sizes from 3 in. x 9 in., to 18 in. x 18 in., (of any lengths varying from 40 to 60 feet). Hewn timber is not imported into South Africa. Wooden poles for telegraph, telephone, and other uses are not imported into South Africa. The white ants are so destructive to wood, that all poles for these services throughout are tubular iron.

Adequate Facilities for Handling Cargo

The facilities for handling merchandise of all kinds at the different South African ports are well adapted to meet the requirements of the import and export trade of the country. Cargoes are invariably landed on the docks at Cape Town, East London and Durban; but at Port Elizabeth and Mossel Bay lighters are used for landing goods of all kinds. The charge for the lighterage is 1s. 3d. per ton, which is paid by the ship.

The dock dues at the ports of Cape Colony are one shilling per ton (cubic measurement) and ⅝ per cent. ad valorem.

The wharfage dues at the port of Durban on all goods for Natal are one per cent. on the value of the commodities in the country when and where purchased. On goods entered at Durban for points in the Transvaal a rebate of ¾ per cent. is allowed.

In every South African port there are telegraph and cable offices which offer the same facilities as similar offices in Canada and elsewhere. The cable rate to Ontario, Quebec, Nova Scotia, New Brunswick, and Prince Edward Island, is 3s. 6d., (85 cents) per word. The rate to the North West Territories is from 4s. (97 cents) to 5s. 6d., ($1.45) and the rate to Vancouver Island, British Columbia, is 5s. 6d. ($1.34). All the ports at which timber is discharged have railway connection whereby timber can be despatched to points in the interior of the country.

Defoliation of Forests by the Spruce Budworm

Considerable uneasiness and even alarm has been felt by lumbermen and others interested in forest products, over the depredations in different parts of Canada, of the spruce budworm (Tortrix fumiferana). It was feared that the spruce might suffer a fate similar to that of the tamarack which was killed by the larch sawfly about twenty-five years ago. As a result, however, of careful investigations begun by the Division of Entomology of the Dominion Department of Agriculture during 1909 and still in progress, the situation appears to be much more satisfactory and reassuring than was at first considered possible.

The destructive work of the budworm was first reported two years ago from Vancouver Island, where the Douglas fir was attacked; and from Quebec, where the spruce and the balsam suffered chiefly. In the case of Quebec, the pests were at first confined to the west-central portion of the province, but during 1910 areas on the east of the St. Lawrence were also attacked. It was this latter circumstance that roused timber owners to a sense of the possible extent of the danger.

While in the caterpillar stage these insects destroy the buds of the spruce and balsam, especially at the tops of the trees. They also bite off the leaves, which, together with the excrement of the caterpillars, cause the tops of the trees to assume a reddish brown appearance. When a large area is attacked it appears as if it had been swept by fire.

As such plagues of air insects can only be controlled by natural means, the Dominion Entomologist visited a number of the infected districts for the purpose of discovering a natural remedy that would meet the situation. Various insect enemies or parasites were found, that prey upon the budworm, and these are being used to destroy the pest. As the percentage of important parasites, especially of the minute species which attack the eggs of the budworm, is unusually large, there is abundant reason for hoping for the extermination of the latter. Judging by previous experiences in studies of this nature, it is not improbable that the insect will be controlled by its natural parasites in the course of a year or two, that is, before it has inflicted any serious damage to the spruce and balsam by repeated defoliation.

The Hardwood Trade in Michigan

At the annual meeting of the Michigan Hardwood Manufacturers' Association held recently in Detroit, the following report was presented by the chairman of the committee on "Market Conditions."

We are particularly fortunate in having reports from practically every member of the association and that the reports of July, 1911, are identical in number and from nearly identically the same members as reported for July, 1910. This gives nearly an absolute comparison for the two years.

While the reports show a slight increase in the amount of stock at the mills, there is less unsold stock than at any time since 1907. Of the total stock on hand there is less of ash, beech, rock elm, soft elm, nearly identically the same amount of basswood and a slight increase in the amount of birch and maple.

Of the stocks unsold there is less of ash, beech, rock elm, soft elm and slightly more of basswood and birch, with maple comparatively the same. Of the total stock there is approximately 10,000,000 feet less July 1, 1911, than for the corresponding period for 1910, and approximately 20,000,000 feet less than for July, 1909, or July, 1908.

The greatest increase in stocks at the mills and practically the only increase of consequence is in the item of No. 2 common and better maple, but as an offset against this there is the fact that there is less No. 2 common and better maple unsold now than a year ago, which would indicate that there is not the real increase, as may appear, but that parties who have purchased the stock are slower to move it this year than usual.

Hardwood Lumber Stocks

There seems to be a growing tendency among consuming manufacturers toward making the lumber manufacturers the holders of stock until such time as it is actually required for consumption. This tendency also helps the appearance of there being an increased supply of some items, while as a matter of fact the total available supply probably is less.

Of the items notably less in supply than a year ago, beech shows a total stock of 37,000,000 feet as against 46,000,000 feet for July, 1910, and of the total beech sold there is 11,000,000 feet for July 1, 1911, as against 22,000,000 feet for July 1, 1910, and No. 3 common hardwood, the item probably of most concern to manufacturers, shows a remarkable reversal of form from one year ago, the total stock at mills being 36,000,000 feet as against 80,000,000 feet July 1, 1910, and of stock unsold there is but 34,000,000 feet as against 43,000,000 feet July 1, 1910.

When we consider that we started the year July 1, 1910, with 30,000,000 feet more of No. 3 common hardwood than the previous year, and that we are starting the year July 1, 1911, with 14,000,000 feet less of No. 3 common hardwood than the previous year, this item should not occupy the weak position that it has for two years or more.

Taking into consideration the fact that general business has been sluggish for two years and especially so during this last year, it seems remarkable that northern hardwood lumber stocks have not increased materially and in this respect we believe this product has been more fortunate than many others.

We believe the general situation to be good and would not think best to recommend any changes from the recommendations submitted at our April, 1911, meeting.

Hemlock

As regards the hemlock situation, we note a very marked improvement in both price and stock conditions, there being a total stock at the mills of 161,000,000 feet as against 193,000,000 feet for July 1, 1910, with both price and demand much better than a year ago. Hemlock lath shows 11,000,000 as against 27,000,000 July 1, 1910, a remarkable reduction in stock.

Owing to the diversity in the quality of hemlock in different localities, the different methods of manufacture and marketing, and the diversity in the methods of grading, your committee feels unable to recommend a price for the different grades, but we believe that much better prices can be obtained for hemlock than a year ago and better prices than obtained last spring and early summer.

Practical Sympathy from Hoo-Hoo

The cordial sympathy of members of the Concatenated Order of Hoo-Hoo for the sufferes in the Porcupine fire was kindly recognized recently by a generous gift of $50, which was received by W. A. Hadley, of Chatham, Ont, former Snark of the Universe, and forwarded by him to the proper authorities.

Under date of July 28, Scrivenoter J. H. Baird wrote from Nashville, Tenn., to Mr. Hadley, as follows: "Referring to your letter of recent date, which I referred to Snark Miller: I am pleased to advise that I have been instructed by Snark Miller to send you cheque for $50 to be applied to the needs of the sufferers from forest fires in Ontario. I am further directed by Snark Miller to say that he only regrets that we are unable to make the cheque larger and that his sympathy goes out to your stricken people.

"Please acknowledge receipt of cheque and pardon me for not writing more fully, I am very busy and will have a lot of things to tell you by word of mouth when I see you at Detroit, to which meeting I am looking forward with much pleasure.

Fraternally yours,
(Signed) J. H. BAIRD, Scrivenoter.

St. John River Storage Reservoirs

Engineers of International Waterways Commission Report that Scheme is Feasible and Desirable

St. John, N. B., Aug. 3.—That the improvements of the St. John river for the benefit of the lumbering industry and whatever water powers may be developed in the future on that waterway is both feasible and desirable, a question that has been under investigation by the International St. John River commission, a commission appointed by the United States and the Dominion of Canada, is now assured through a recent report to the commission from its board of consulting engineers—Hardy S. Ferguson of New York city, and S. J. Chapleau of the Department of Public Works of Canada.

In their report the engineers, who represent the best trained and most skillful hydraulic engineers of the two countries state:—

"We have no hesitation in stating that what we have already learned makes it apparent to us that it is both feasible and desirable to devop a system of storage reservoirs and to improve the river channels in many places, and that much can be accomplished towards making the driving of logs safer and less expensive, and toward increasing the low water flows for the benefit of any water powers which may be developed along the river in the future."

To those who are interested in the work of the commission and those who have their interests along the St. John river the report of the consulting engineers is most significant, and means if adopted by the commission, that eventually the two governments may take steps to carry out some comprehensive scheme for conserving the water of the St. John and improving the river, to the benefit of both the lumber industry for which it is chiefly used at present and whatever other development may take place in the future.

Canada is said to be anxious that the United States join with her in carrying out some plan for the improvement of the river, which will put an end to the difficulties, which have occurred in the past, and led up to the bloodless "Van Burean War" of 1905.

Most of the field work which has been done by engineers at the direction of the commissioners has been completed and the larger part of the data has been put in shape for the consulting engineers to study in connection with their final report. Briefly the work covers a comprehensive examination of the St. John river between Grand Falls and Seven Islands and of the lakes and main branches tributary to the river between these limits. Profiles, discharge measurements and gauge readings have been made, areas of important lakes determined, surveys of sites for dams at the outlets of these lakes have been completed and other necessary information secured from which to estimate the reservoir capacity available, cost of constructing reservoir dams and manner of treating river channels for improving log driving conditions.

The work of plotting the Black river surveys, plotting Seven Islands surveys, completing a general map of the St. John river, plotting, rating curves and gauge readings and computing discharge measurement is now done. A small office force has been engaged on this work, and the work that remains to be done is being hurried along as fast as possible under the direction of M. H. Ranney, chief engineer in charge of the field work. It is expected that the engineering work will be completed within the next four months.

A party has been in the field making a survey for a reservoir site on the main river at Seven Islands.

In addition to field and office work which is in progress, there has been some work done on the St. John and its branches above Seven Islands. This section of the river is very important regarding lumber operations and log driving conditions, and the engineers are securing definite information as to the possibility of creating reservoirs and improving the river channels above Seven Islands.

The surveys of the St. John river made under the direction of the commission extend down as far as Hartland, and some of the finest maps in existence of this important waterway and the section through which it passes will be one of the results of the commission work. In fact these maps will be the first complete and authentic maps ever made of that section.

The Canadian government has made a map of the river from Fredericton to Woodstock and by making a map of the section between Hartland and Woodstock the commission will have a comulete map and survey of the river between Fredericton and Seven Islands.

Up to the present time the consulting engineers have confined their work to securing such data as they considered necessary for developing a comprehensive improvement scheme. Enough of the data and information has been secured to justify the consulting engineers in beginning their studies of the problems which will form the basis of their final report to the commission which they plan to have ready some time this fall.

Mr. Joseph F. Merritt, of St. John, N. B., a member of Merritt Bros. & Co., met with a serious accident recently at their mill at Black River. While showing a workman how to make repairs on a saw, the machinery was inadvertently started. The saw cut deeply into Mr. Merritt's wrist almost severing the hand. The doctors believe the hand can be saved.

Why U.S. Lumber is Selling in Canada

The increased shipment of lumber from the North Western States to the Canadian prairies is the subject of an interesting letter and editorial reference in a recent issue of the Mississippi Valley Lumberman. The letter is as follows: "Editor Lumberman—I notice on your editorial page in the July 14 issue a query as to why the lumber trade of the west coast is going to Canada instead of the central states. The same question appealed to me a few days ago when I received a letter from a friend who is located in a lumber town in Washington. In mentioning the condition of business in his town he stated that conditions were slow, giving as a reason that they had always shipped to the Dakotas and Nebraska, whereas they were now shipping to Canada, and not realizing as much for their products as formerly. From all reports this is not the exception, but the rule. Why is it? Is it because of a desire on the part of the manufacturers to keep their plants running and their employees busy, or a result of the proposed reciprocity treaty? I would rather think it was a lack of demand on the part of the aforesaid states. Surely no manufacturer would ship to Canada at a less margin than to the United States, without a good and sufficient reason."

Editorially the following reference is made to the subject:—"Briefly, the manufacturers of the Pacific states are shipping lumber to Canada because they find there a market for their products. To go further, it is probable that they are shipping there at a smaller margin of profit (if they are getting less than they ordinarily get in the United States) because there is practically no market for their stock on this side of the line under the present conditions. Why the demand is so light on this side of the line is due to a number of causes. Indirectly the agitation caused by the probability that the reciprocity treaty will become a law has resulted in unsettled conditions in the United States from which the lumber trade is suffering. The treaty reduces the tariff on lumber $1.25 per thousand, and it is quite likely that the farmers, and other buyers of lumber as well, believe that after it is enacted the price of lumber will be less by that amount. But there are other reasons why the farmers are awaiting the passage of the treaty.

"The treaty also removes the protective duty on most of the products of the farm, and whether they are right or not, the farmers have the idea that the free admittance of Canadian farm products will lower the price for farm products by the amount of the present duty. If they are right in this, it will not only lower the price of their products, but will also lower the value of their farms. Under the circumstances, they can hardly be blamed for hesitating about spending money for improvements.

"Present crop prospects also undoubtedly have some effect on trade. While the year started out all right, the dry weather in many sections has undoubtedly lessened the prospects for a large crop, and the retail lumbermen are not buying stock as heavily as they would if the outlook were better. On the whole, it is probable that the winter and spring wheat crop together will be larger than it was last year, and the corn crop will also be large. Nevertheless, the farmers are waiting for the harvests and the retailers are waiting for the farmers.

"The manufacturers of the Pacific northwest have always enjoyed a good demand from the Dakotas and Nebraska. Since the partial crop failure of last fall, the demand from those states has been exceedingly light, and if they are shipping lumber to Canada in larger quantities than usual it is because of the light demand in their usual markets. If they could sell at better prices in the United States, they would not ship to Canada. And they are manufacturing lumber and shipping it to whatever market will take it, because it is better to manufacture and ship at a small margin, than to close down their plants altogether. There are certain fixed charges that must be met whether or not a saw mill plant is operating, and if the mill shuts down altogether the crew will become scattered, making the resumption of operations exceedingly costly. It is probable, too, that the manufacturers find it more profitable to operate even at a small margin than to close down and throw a large number of men out of employment."

The Retail Dealer and His Problems

An Ideal Shed—Stock and Investment

A Well Planned Shed

Economy, utility and convenience are the three essentials in shed designing. They are all well obtained in a shed built by the Fred. A. Smith Lumber Company at Paxton, Ill., which is described by Met. L. Saley in a recent issue of the American Lumberman.

The shed is 85 x 200 feet. The foundation is of concrete, the outside wall, and that at each side of the main alley, being solid concrete, with the exception that the outer wall along the side of the shed shown has hollow building tile inserted every four feet for ventilation. The balance of the shed foundation, and also that for the lumber piles, is concrete piers. The roof, which is of the ready variety, is white, which the builders do not believe will permit the heat to penetrate as it would were it black. This is a point which I had not heard discussed before, and no doubt the idea was gathered from the well known fact that in hot weather light colored clothes are cooler than black ones.

FRED A SMITH LUMBER C

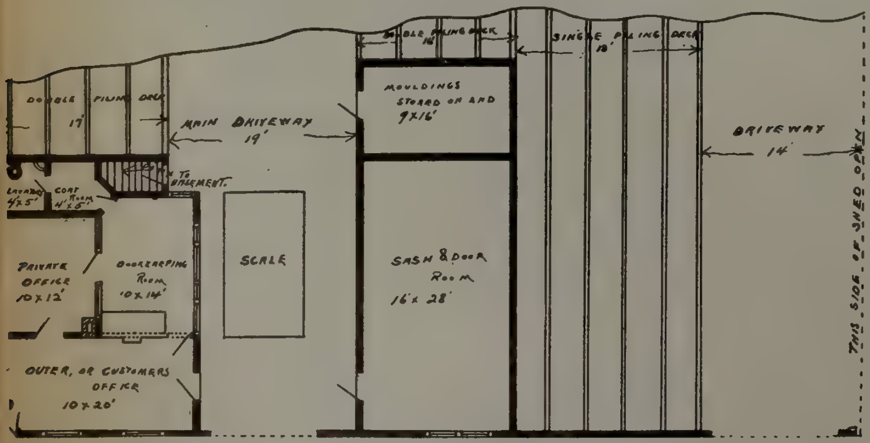
An Ideal Retail Shed

The side of the shed shown is fourteen feet to the eaves, and is sided with yellow pine drop siding, No. 116, put on up and down. This siding is also used on the front of the shed, with the exception of the office, where 4-inch drop siding is used. The rear end is sided ten feet high with 6-inch straps, laid one inch apart, with drop siding above. The opposite side of the shed is open, and the hood extends over the driveway fourteen feet. This is unlike the ordinary hood, however, as the ends of the shed are enclosed full width, and the eaves of the hood are supported by posts.

The bins are eight and one-half feet in the clear, those of the lower deck seven and one-half feet high, and the platforms are three feet wide.

The main alley is nineteen feet wide, and is paved with concrete for eighteen feet from the shed entrance. The balance of the alley is filled with cinders, which occasionally are wet with a hose to lay the dust.

The cupola windows are arranged with a latch and cord to admit of opening, but as yet, owing to the open side of the shed, and the slatted end, there has been sufficient ventilation with the windows closed.



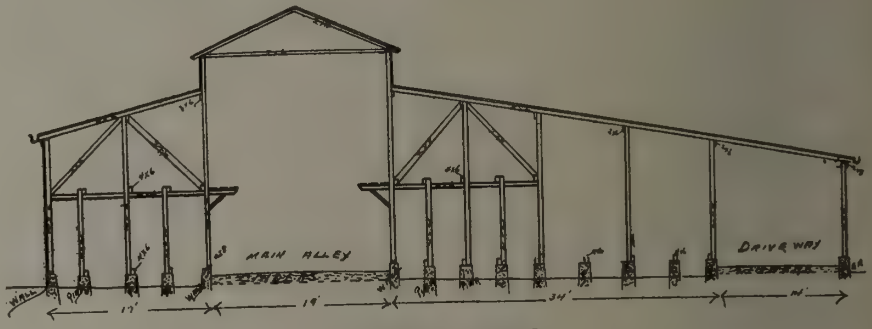
Floor Plan of Shed.

The scales are in the main alley, with the bar in the room of the bookkeeper, and the side of this room extending into the alley is practically all windows, thus affording a view of the entire length of the alley. As shown by the sketch of the floor plan, the wareroom is directly across the alley from the office, and back of this is the molding room, 9 x 16, and twenty feet high, extending into the cupola, in which molding is carried on end. This room is sided with 6-inch flooring, which renders it practicaly dust-proof. This method of storing molding has been found so satisfactory that it is employed at all the sheds of the company.

Extending from the open side of the shed, and enclosed with a picket fence, is a lot forty feet wide and the length of the shed, in which tile and sundry items are stored. The barn is located on the rear of the lot, and the cement, lime and salt house is alongside the track, convenient to the yard, and so constructed that the material may be unloaded from the car with trucks.

The office arrangement has been found both convenient and practical. The outside office has a door opening into the alley, and has a table for the convenience of customers. The bookkeeper's room is separated from the outer office by a standing desk built in the partition, which is plastered from the desk to the floor. Above the desk, extending to the cap trim, which is set on a line with the door and window trim, is an opening filled with a grill of flat wirework, with a cashier's window in the centre of it. The door opening from the outer office into this room has above it a wire mesh panel to match the grill over the desk. The coat room is also used as a telephone booth. The office is heated by a small steam furnace, which, to say nothing of the comfort and convenience, has been found more economical than stoves.

The company has just completed a shed at Rossville, 86 x 145, similar in arrangements to the one described above.



Plan of Side of Shed

The company has eight yards, all in Illinois, and at each the buildings are painted a golden rod yellow, with white trimmings. The delivery wagons are yellow, and with a single exception the horses of the company are black.

Shedding the Piles

For 100 feet or more there was a string of piles of lumber in the yard, and the dealer said it was his intention to build a shed on the ground occupied by the lumber, but he was getting no nearer to it than he was two years ago when he determined to build. It is the only outside piling room he has, and as he replenishes his stock about as fast as it is sold, the piles remain of about the same size.

"Shed the lumber without removing it," I suggested.

"Never heard of such a thing," he replied.

I told him that M. H. Hand, of Plymouth, Wis., had just such a problem to solve as confronted him. His lumber was in a pile on the ground he wanted to build a shed; he wanted to save the work of handling the lumber twice in order to do so, and he built the shed without removing it.

The shed of Mr. Hand was made possible by the use of poles for support. Of these poles, twelve 6-inch, twenty-five feet long, and twenty-four 6-inch, sixteen feet long, were used. The foundation of the piles were not disturbed. If Mr. Hand had wanted a frame shed that would require bracing in every direction, and sills, the work of removing all the lumber would have been a necessity.

This shed is 38 x 198 feet, the width permitting of easy piling inside of the poles. It took 90,000 shingles, which were of a cheap grade, to cover the roof. The shed is minus a hood, but this could have been easily added had it been to Mr. Hand's taste.

The dealer was interested. "By gracious!" he exclaimed, "that is an idea." Whether he will follow the example set by Mr. Hand I don't know. At any rate he has been shown the way.

I have seen lumber piles roughly covered, but I had not before seen a permanent shed built over any great amount of lumber without removing it. But to do so, provided poles are used, is as easy as falling off a log.

Dissatisfied with the Results

The shed that was completed late last fall cost, in round numbers, $3,000.

"What do you think of the yard?" the proprietor asked, after we had been through it.

"Pretty good outfit."

"Yes, but what do you think of it? I can see where I have made a mistake, and I should like to know how we tally."

I told him there was little to be gained by criticizing a shed to a man's face. Little Dutchie might criticize it in the fastness of my room at the hotel, but that was different; and that it was my aim to be more of a gentleman than Little Dutchie is, anyhow. Once a shed is built it is built; the chances are it is the only one that will be built by the dealer, and it is not my business to go around the country passing my opinion on the demerits of a shed unless I am particularly asked to do so. Moreover, there is such a variety of tastes that the opinions of any one man do not constitute law. It appears to be the taste of some dealers to shove lumber into the air, to the second deck, sometimes to the third deck. But as for me, I don't like to work well enough to do it. Further, I should not call it economical to do it.

"In this instance you are particularly asked," he said.

"To start with, then, I would spike the gate shut in the rear end of the yard."

"For why?"

"For two reasons. I should want to see from the office every team that entered the yard, as such an arrangement might assist at times to refresh the memory of a careless foreman. My No. 2 reason would be on advertising grounds. You front on the main street, and I should want every load that left the yard to be seen on this street. I wouldn't permit a wagon to sneak out the back way and go to its destination on a back street. I should want my teams seen on the street as often as the other fellow's."

"Two other fellows," he corrected.

"To my mind it would have been an improvement to have located the office between the two alleys, instead of in the corner, in which case, with a slightly projecting window on each side of the office, everything that was going on in both alleys could be seen. Any team that was going in or out could be seen from the office."

"I accept the amendment," he said.

"As you have plenty of ground room I would have extended the shed, and as far as possible eliminated the upped deck."

"Objection overruled," he said. "I never have seen any disadvantage of a second deck. Build as many sheds as I might I would put it in."

"I would have provided more space under the piles for ventilation."

"Which would no doubt have been wise," he remarked.

"I would have left the east side of the shed open, with a 12-foot hood over the driveway. With these changes, and with the alleys planked, you would have a shed that was a shed, in my opinion. Now let's see how we dovetail."

"I am not pleased with the d—— shed, nohow," he said. "I wouldn't duplicate it if I had as much money as I could lift. The next time I would build an open shed, with an alley and double piling spaces on each side of it, and with a wide hood over each driveway along the outside. I would put the office in front, and between the office and shed rooms for finish, molding and mill work."

"Why didn't you build such a shed?" he was asked.

"Because I didn't know enough; I hadn't learned," he answered. "Last month I took a little trip west, and with some modifications I saw a shed that was to my liking. I built this shed—simply built it without being fully posted as to what there was in the shed line."

Here was frankness and confession that I never had met with before. I have seen hundreds of sheds with glaring faults in the way of construction, but it is human nature, I suppose, that these faults are not generally pointed out to a stranger, or acknowledged even, if they are pointed out by the stranger.

All this talk was about a shed, but no doubt many times the experience of regretting the way we had built has been ours in matters outside of lumber sheds. If the results of the efforts of any man has been wholly satisfactory that man is not myself. As a rule Little Dutchie performs so badly that after reading the stuff he grinds out I am provoked enough to turn him out doors.

Then I don't know but the dissatisfaction with the work we do is a good symptom, for if all were satisfied the world would come to a standstill. If all had been content with railroad and automobile travel there would have been no flying machines. Fatalities have been associated with these machines, but thousands of inventors are at work in an endeavor to make them more efficient. If prophecy does not fail, the time will come when I visit you that I will alight at your office door in a little individual flying machine. Great idea it would be if the birds are always permitted to outdo us.

I do not understand how the shed that could be built to-day could be improved, but to say it will not be would be reckless. Not one knows but the shed that will be built twenty years hence will look as much unlike the shed of to-day as the modern shed of the present is unlike the one that was erected a score of years ago. Certainly improvements have been made right along, and possibly our foresight is not penetrating enough to see those that will be made in the future. At any rate we will keep right on doing the best we know how, and maybe such a determination will land us still higher.

Fallacy of First-Sight Impressions

There are those who claim they can tell a good man at sight, but when they tell me that, immediately I am from Missouri. A man who has made a study of phrenology, physiognomy etc. may read character to an extent, but not one in thousands of us has paid any attention to these branches. I have visited the penitentiaries of many of the states, and I must confess that I have seen scores of inmates which, were they not in convicts' stripes, I would trust offhand as soon as I would an equal number met on the streets. I once said this to a man, and he replied that there was good reason for it; that there were men on the inside of the walls who were no worse than those on the outside, the only difference being that those on the inside had been caught.

A lineyard proprietor who has thirty yards or more had this to say: "I never pretend to tell whether an employee will make a good man until he is tried out. None of us meets a man without having an impression of some kind or another, but such an impression is a result of our tastes. I can remember when foolishly I had an objection to red hair, especially red-headed girls, but if you were to go to my house you would know I rid myself of the silly idea, as the hair of my wife is golden. You see I don't call it red now.

"I know well enough that at first sight you would not fall in love with our man at ——, but he is one of our best. He is as steady as a clock, competent 'way beyond the average, and is liked by our customers, once they know him. I hired one young man because he was so prepossessing in appearance, and before we got onto him be beat us out of several hundred dollars. I want to know as much about the career of a man as I can; something of the family he is out of if I can, as I am one that believes that blood tells. Don't care much about any recommend he may bring, as I have known employers to give a man 'a good character' when they would no longer have him in their employ. That isn't the thing to do, but it is a thing that has been done to me twice that I know of. If a man handles himself well in the yard he recommends himself."

"Married or single men, which?" I asked a lineyard proprietor.

"Married, every time," was his answer.

Just then he looked at his watch; it was 3.30; he had an engagement at the bank at 3.45; he would have to ask to be excused; and he was obliged to leave before he explained the connection of married life with a good business policy. "Go in and talk with John," he said. John talked, but he said nothing that I thought would illumine the lumber industry.

What Was Not Done in a Week of Sundays

There is a gerat deal in taking time by the forelock. If we do not it is liable to get the same hold on us and give us a shaking. We often hear it remarked by a man that he has not the time to do this or that, but rarely does he create the impression that he is that busy. We have to carry ourselves straight if we do not get set down as four-flushers. All told there is a lot of time, and if one takes advantage of it there is no telling how much can be accomplished.

Not all of us have had all the business we could lay to this season. We have had time on our hands; actually, in some instances, time to burn so far as taking care of our regular run of trade was concerned.

A light trade is what a dealer told me the last week he had been having for a month. "It started in pretty well, and I thought that when the farmers laid by their corn it might pick up again, but it hasn't. The last week has been one of seven Sundays," he said.

I could not see many indications around the premises that the days of the week had been treated other than Sundays, so far as the work was concerned. Along the side of the yard there were weeds as high as your chest, and in the portion of the yard beyond the piles the grass had not been mowed this year. It was decidedly scraggy. But that didn't affect the quality of the lumber in the piles, did it? Sure not. If the weeds had overrun the whole yard, and had grown as high as the piles the quality of the lumber would have remained the same, except that the weeds might have shaded t so it would have rotted. If there was a scythe on the premises there was no man who was anxious to exercise his muscle in swing-ng it. The foreman had his sleeves rolled up to his elbows, look-ng as if he was ready for a job, but probably the boss didn't sic him on.

A couple of years ago, in a yard planned similarly to this one, a yardman was seen running a lawn mower, and it looked as silck as any man's lawn on the street. The front fence of the yard was wire, hence there was nothing to hinder those who passed along the walk or street to see what kind of a yard keeper the dealer was. The piles, with the smooth, green carpeting in the rear of them, was a pretty sight.

In this yard of weeds and grass there are several piles the ends of which are so near the ground that in a rainy spell the mud from the driveway couldn't help splashing up against the lower courses if it should try. During that week of Sundays the foundation under these piles could have been raised had there been enough gumption around the yard to have done it. There was other work that, had it been done, would have improved the appearance of the place. The advantage that could have been taken of the week of Sundays went by default.

If you are a right-up-to-the-minute lumberman I don't believe you will say that notwithstanding trade may be light time hangs heavily on your hands. You require some of this time when you are not piling lumber in, or loading it out, to put your place in condition that will help to sell lumber.

Selling lumber and trying to collect pay for it is not all that constitutes running a yard successfully. Aside from this there is as much work as a dealer can lay his hands to, provided he sees it.

The Dry Season

In many sections to handle material in the yards such a season as we have had up to the date of this writing has been done much pleasantly by many than during former rainy periods. The great majority of retail lumbermen do not carry all their stock under cover, and in the outlying yards, particularly in the prairie states, where rain makes mud, there is much unpleasantness in handling material. In many of these yards following hard rains ducks would think they were in their habitat, and to wade the mud their legs would have to be as long as those of storks. There are several million people living outside these states who never have learned what mud really is. Maybe I have told you that in the streets of the little burg in which I live I have seen the mud so deep that delivery of goods from the stores was made by hand. If horses were used the people of China might be able to get horses without price, as they might drop through.

If all seasons had been as dry as this one the prevailing type of shed would have been different. The original inclosed shed was built when lumber was received at the retail yards in a well seasoned condition. It was not thought to be good "ethics" to ship so quick from the saw as has been done of late years. The owners of these sheds say that at the time they were built there was little trouble with moldy lumber, but that there came a time when a good husky washerwoman could wring water from the lumber, and a new type of shed was required to care for it. And many a umberman has not the shed now that will care for it properly, as I expect there is enough lumber to load ships that is piled in the yards for a while before the dealers will risk putting it in the shed.

Many of the old sheds would not be duplicated these days, except it might be by some dealer who was entirely ignorant of the correct principles of shed construction, and at that he would have o be fresh in the business, as any man who had been through the mill would know better. In many of these old sheds there was not a single provision for ventilation, evidently the idea of ventilation being as far from the builder's mind as the sky is from the earth. When the alley doors were open the breeze would go through, but as these doors were closed about twelve hours every week day, and all day Sunday, the lumber during the time the sheds were closed was in dead air. It is also well enough to bear in mind that open alley doors of themselves do not properly ventilate a shed. The front end of the piles, in this event, catch the stirring air, but ventilation should be such that the air is admitted in the rear of the piles and under them. When air does not circulate it becomes dead, and it does not circulate unless there is both egress and ingress. What is commonly known as a "draft" is necessary.

I have seen many of these old sheds in which ventilation has been provided for by cutting openings through the walls in the rear of the piles. Neither in these sheds of an earlier type could the air get under the piles, the sills on which the lumber rested occupy-ng all the space between the lumber and the ground—a defect in construction that has been observed in many new sheds.

A dealer who has an unloading deck that is under roof remarked that thus far this season the roof on the deck had been of little consequence, as the few cars of lumber he had received might have laid out doors with impunity for days, as far as moisture was concerned.

Another dealer said he couldn't recall to mind another season when any hour of nearly every day he could send out a load of material without an eye on the weather. "These days the thunder may roll, and sky may be covered with clouds, but we have got past thinking it will rain," he said. "The carpenters have been able to work as steady as a clock this summer, and when lumber was drawn to a job there has been no necessity for hustling it under cover, as in case it is when a shower is liable to come up any hour."

Thus the law of compensation is always working.

It follows that dryer the weather the more dust there will be to contend with. The dirtiest lumber I have seen was in a Connecticut town. At this place the lumber was in an open shed over open coal bins. I didn't learn whether the dealer was crazy or not. Pretty sure he was out of his head to some extent. I saw a dealer (now dead) who brushed the dust from his piles whenever he thought it would improve their appearance, and heard of another who uses a duster on his lumber. Get as little as we may, we get enough of it.

Not long ago I was in a shed, there was a good healthy breeze, the wind took a quick shift, and a cloud of dust came into the shed. It was not kind enough to go on through, but settled on the piles on either side. Possibly a portion of it alighted in the alley, but as to that I could not affirm, as already there was so much dust there that even a fair sized cartload would not materially add to it.

We are not very particular as to dust. I once heard a dealer remark that if when loading a team the dust should fall from a board taken from the top of a pile he should be slightly ashamed of himself. Asked how he prevented it, he said he kept a tab on the dust and when he saw it was perceptibly gathering on the top courses of a pile he pulled the boards down, rattled the dust from them, and replaced them the other side up. Few of us, however, are to that pains.

Stock Handling and Investments

"Better methods of handling stock to keep down investments," was the subject of an excellent address by H. A. Templeton at the recent annual meeting of the Montana Retail Lumbermen's Association. Mr. Templeton's remarks were as follows:—

This paper has been prepared from the view point of one who is in business for profit; to which class it is assumed we all belong. If there be among us a man who admires more than profit fine large piles and extensive sheds well filled with good grades of lumber, and one who is willing to pay for the gratification of his whim, this is not for him.

Whenever the investment in business pays us less or even as little as the current interest rate on farm mortgages, we will get out of business.

We all know that the margin between buying price and selling price has been on the decrease in the past several years. The volume of business done per yard has certainly decreased, owing to the largely increased number of yards and the consequent cutting up of former territories. These two forces have acted concertedly toward reduction of net returns on investment, and for many of us the effect has been very nearly disastrous.

Therefore, the method by which we are to maintain the proper ratio between investment and net profit is of the greatest importance.

Probably the first thing to be done is the installation of modern and economical methods—a reduction in operating expenses. The next thing is to reduce the investment to a point where the yearly profit possible will be a reasonable return on that investment.

We younger men listen with mouths open to the reminiscences of you who sold lumber in Montana fifteen or twenty years ago. You tell us of the days when there was one yard in a town of a thousand to five hundred people, with a territory fifty to one hundred miles in radius, and sales ran up to what now seems fabulous amounts.

Investment Proportionate to Demand

To-day these same towns have three to five yards each, with a territory having a radius of possibly ten to fifteen miles. The sales and net profit you tell us are possibly one-quarter what they were in the old days. But the investment? Just as large as it ever was, and possibly larger. Successful continuation of a business in this plight certainly demands a reduction of investment in the same ratio as the sales and net profit have been reduced. It makes the difference between a good business and a poor one—success and failure.

For example: A and B each own a yard in a town of five hundred to a thousand people, where there is forty to fifty thousand dollars of business annually. Both are buisness getters and aggressive with the result that the business is about equally divided. The margin of profit is approximately the same, and consequently the end of the year finds each with about the same amount of net profit, say a thousand dollars.

Certainly, one would suggest, there is very little to choose between these two men and the condition of their businesses. But, whereas A has a total investment in stock, real estate, buildings, and outstanding accounts of ten thousand dollars, B's total investment foots up to twenty thousand dollars.

With this added information it is easy enough to choose between the two yards. A makes ten per cent. on his investment; B makes five per cent. on his. A's business is prosperous and successful; B's business could not be called good according to any definition.

There is only one thing for B to do, that is to reduce his investment to ten thousand dollars, and only when he has done this will his business be profitable and will he be able to meet his competitor on even ground.

I would say that a reduction of outstanding accounts and a shortening of the terms of sales, is the first step to be taken. A reduction of stock the second, and with that reduction this paper is to deal especially.

We all know the difficulty of selling something we haven't got, and agree that it is absolutely essential to have what the customer needs when he needs it. It is largely in our power, however, to educate our trade as to what items of lumber they need and use.

A Personal Illustration

Pardon reference to personal interests, but to illustrate. Some time ago we established a yard in a new town out in the homestead country. The business in sight was not large and we could not see justification for a large investment. Our stock was bought accordingly, and was made up of the regular items of dimension, ten to twenty feet long. Twelve inch number three board; mixed widths number three boards; mixed widths number four boards; eight inch number two shiplap; six inch number two pine flooring; four inch vertical grain fir flooring; six inch number two drop siding. A small amount of C finish of each width. Extra Star A Star shingles, two sizes of two-light windows; two sizes of four-light windows. Some stock doors; threaded felt; thirty pound building paper; two ply roofing, and only a few items of regular stock.

Our customers came in for their little shack and barn bills, and were supplied from this stock to their entire satisfaction. They never thought of or mentioned number two shiplap, or number three shiplap; four inch pine flooring or six inch pine flooring; Extra Star A Star Shingles, or Standard Shingles; one ply roofing or three ply roofing.

Shiplap was shiplap; pine flooring was pine flooring; shingles were shingles, and so on down the line.

A year later a competitor came in. Not a bad mean competitor, but a good one, a nice fellow and a good lumberman. He went right at it, though, to get in a "complete stock," as his ads. read. Before long he had Number 1 drop siding, Number 2 drop siding, Number 3 drop siding; four inch flooring and six inch flooring; Number 2 shiplap and Number 3 shiplap; Red Cedar bevel and pine bevel siding.

Our yard looked like a vanishing shadow compared to his. The trade began to specify grades and call for long lengths. We simply had to come to it. Then they wanted three ply roofing and half ply roofing, as well as all weights between, and were ever fearful, at that, lest they should not be given the grades and weights wanted, since they had found out there were such differences.

To make a long story short, our investment doubled at that point inside of six months; and did our volume of business or the net profits increase? Not a cent. Was our trade better cared for or better satisfied? Not a bit of it.

This incident was one in the experience of a very small yard I know, but the same experience also comes to the large yards in the large towns. Why introduce southern yellow pine to a trade already educated to and satisfied with fir and Montana larch finish? Why duplicate a stock of cedar with California red wood? Why carry every weight of red rosin paper on the list and some special weights besides?

You can't give your trade any more for their money by so doing. You can't gain a reputation for having a more complete stock than your competitor, for he will add these items as rapidly as you do in self defence. So, I say, the first thing is to educate your trade to a stock which the business will justify. Do not try to carry every item found on the list. If you already have your stock duplicated in all kinds of woods available and all weights of paper and roofing, start right in and cut some of them out. It is a hard job, but it can be done. A man does not have to injure his conscience to argue convincingly with a customer that a standard shingle is not as good a buy for the money as the stars. You know as well as I do that fir flooring is as good as yellow pine. Educate your trade to that point of view and cut out the silvery stuff from the southland.

No man ought to use twenty pound red rosin paper. It is no good. Then don't carry it. Half ply roofing is but little better than tar felt. Then don't do your trade the injustice of tempting them with it. Two ply or tar felt is better for the customer and better for you.

Then, as to the quantity of each item necessary. A customer wanting a thousand feet of boards is as well satisfied to take them from a pile containing four thousand feet as from one containing ten thousand feet. The only problem is to keep from reaching the bottom. Try always to have some left, for it is disastrous to any business to be forever out of stock.

To one who has never made a special effort in that direction, however, it is surprising to know how small an amount of stock will serve the purpose, if it is carefully watched, and studied with a view to having future needs constantly provided for by ordering mixed cars made up of small amounts of many items. Two by four should be ordered in lots of one hundred each, instead of thousands. Sheeting in lots of five thousand feet instead of car loads.

Concentrate Your Stock.

Make it a point to keep all of each item of stock in one place. Do not scatter your six inch sixteen foot flooring all over the shed in three or four different piles. Some day you will forget where one pile is, think you are out and order a lot more, which is not needed. Always keep copies of orders filed in an orderly way. Look them over carefully when placing further specifications, and be sure you are not duplicating some item. To paraphrase Patrick Henry, "Eternal vigilance is the price of doing business with a small stock."

For line yard companies or others where the buyer is not right on the ground and familiar with the yard day by day, a piece stock sheet record is all but essential. Such a record when properly kept shows exactly how many pieces of two inch dimension of each size and length is in the yard, and how many feet of each item of boards and products.

Never buy anything which you do not need, or stuff which is not regular stock in your yard, simply because it is cheap. It may look like easy money, but the tail-end left over from an odd lot will eat up the profit, as well as clutter up your yard; or if all the lot is sold some of your customers will have taken a fancy to it and will demand more after the special lot is gone. There you are—either add it as a regular item of stock or have a dissatisfied customer.

But in spite of every precaution the time frequently comes when a yard is long on one or two items of stock, and short on others. It is then that the art of salesmanship is called into action. Not a man should come to the yard and get away without being tried out as a prospective buyer for some of that over stocked item, while the short stock item should be held back by substituting and other means when that can be done without injustice to the customer.

Get Rid of Old Stock

Referring again to the long stock item, nothing gives the yard such a bad appearance as an old black pile. When a pile of boards get black they are twice as hard to move as when they were bright and new. Old dull looking stock should be gotten rid of as quickly as possible at whatever price it will bring. It cumbers a yard and gives it a dismal appearance as well as tying up investment which it does not deserve.

Study the demands of your trade constantly. Find out which length of each dimension goes out most rapidly and plan your stock accordingly.

Your country yard owners; be long on bridge plank in June when the rains and consequent high water wash-outs come. Be sure your shiplap piles are well up at harvest time. The farmers will be building granaries soon. Avoid ordering plaster, lime or cement in the fall. Have your post pile low when the snow comes. In short, be always vigilant and keep in touch with the demands of the season and the peculiar needs of your trade. Learn to know your people and their needs, the way a musician knows the keys of a piano. Provide what they need when they need it and for ever avoid providing what they do not need and can't use.

It is something of a tragedy to see a fine big lot of B. & B. finish stored away in the shed of a little country yard where the farmers only want to pay for Number 1 common, with which to trim up their modest buildings. A big pile of Number 1 clear flooring in the shed and not a 2 x 4-16 in the yard. A tragedy indeed, and one how often enacted. Within the past month I have been in a little country yard where there is three thousand feet of as fine 1¼ inch white pine finish in the shed as you can find any place. Three hundred feet would fill every order that yard will have for thick finish in a year.

The consumer might offer his criticism that we are striving to get as much from him in the way of business and profits as possible with as little outlay and investment as possible. When he makes this criticism he is short-sighted, indeed. Can any man stay in business without making interest on his investment? Certainly not.

(Concluded on page 41)

Sanding Fine Furniture Stock

Requires a sander with adjustments easily and quickly made, and with all operating parts so simple in construction that keeping them in perfect alignment does not require expert attention. Every working part has been simplified for this reason on

Berlin Triple Drum Sanders

No other sander has carried this idea so far as the Berlin, because no other builder recognizes that simple adjustments increase the efficiency of a machine.

Ask for Sander Booklet

TAKE the Drum Adjustment for instance. Each Berlin Sander Drum may be adjusted separately or all of them simultaneously by means of the same hand wheel. Thus drum adjustment is made far more accurately and in less time, than where there are three handwheels necessary.

With the one handwheel all drums may be raised equally at the same time, then the separate drums properly adjust for correct proportion of the cutting. With three separate handwheels all adjustment is a matter of guess work until several pieces are run through to test the setting of the drums.

Even if a new operator were to make poor adjustments of the drums, good stock need not be ruined by taking too deep a cut. He has the reverse at hand to back out the stock. This same lever starts and stops the feed instantly. No other sander built has this feature.

Another exclusive feature of the Berlin is the feed control lever. With this lever three changes of feed speed are obtained as well as starting and stopping. Feed changes on other sanders are made by changing pulley sizes for the different speeds.

Adjustment of feed rolls, press rolls and drums for aligning are simple and quick. It requires only the loosening of set screws and turning up or down the bearing screws to secure perfect alignment. Moreover once aligned they remain so.

No sander part receives harder wear than the oscillators; but this is easily taken care of on the Berlin. The adjustment collars are kept in place by set screws. If any wear occurs in the oscillator box a set screw is loosened and the collar turned so that all lost motion is taken up. No other oscillator part requires adjustment. The oscillator box is cup shaped and will retain oil up to the shaft bottom. Better investigate further.

Operators Should Choose Sanders

Given the chance, operators will choose the most efficient sander, because an operator prefers the machine simplest to operate with drums easiest to cover. After thorough investigation he would like and recommend

Berlin Triple Drum Sanders

One operator may prefer the **spiral** type of drum, another the automatic take-up. He may choose either on the Berlin.

SEND FOR SANDER BOOK

The Berlin spiral drum is well known for its very effective sanding and polishing abilities. Paper is wound about it spirally with edges lapping so that there is no break in the cutting surface. A groove is made in the drum shell and covering to allow of lapping edges without a ridge. Under average conditions this drum is the most efficient built.

The spiral drum does not depend upon automatic means to tighten the paper and keep all slack out of it. Many operators prefer to know just how tight their paper is. These men get better results with the spiral because they tighten the paper to suit themselves, after which no slack occurs.

The Berlin automatic take-up straight opening drum has no competitor in its own type, because of the flexibility of the take-up device. All other drums of this type use straight bars across the drum to clutch the paper, so that in order to take up slack in the paper it must be loose all over. The Berlin flexible device takes up slack wherever it occurs in the length of the drum. No danger of paper folding over, creasing and tearing on this drum.

Paper may be put on either of these Berlin drums as quick if not quicker than the less efficient drums offered by would-be imitators. Another thing—Berlin drums are balanced perfectly. The straight opening drum as well as the spiral is balanced in running condition and cannot be thrown out of balance.

There's a 32-page booklet on Berlin Sanders that all operators and superintendents should have. Send for it at once. It's free and full of information.

CAMP DEPARTMENT

Logging in British Columbia

At the recent meeting of the Pacific Coast Loggers Association, in Vancouver, B. C., Mr. F. H. Parks, of the International Timber Company, delivered an interesting address upon "Logging in British Columbia." Mr. Park's remarks were as follows:—

It is beyond question that logging, as practiced in British Columbia, has passed beyond the old haphazard rule of thumb stage. The business has in reality achieved the honorable position of a profession, requiring skilful management and a high degree of technique to carry any undertaking to a successful conclusion. The old-time logger with his oxen and jack-screws, has almost, if not quite, passed out of sight. Where once was his single camp on the shore, with few men and primitive equipment, one now finds the highly organized community with railroads, donkey engines, well stocked stores and hospitals. Large capital and effective organization are not only necessary, but fundamental. In addition, conditions would seem to warrant the assumption that this is only a beginning and that future logging operations, as the timber areas become further diminished and distances from tidewater increase, must of necessity become more complex, demanding increasing skill and capital.

Acquisition of British Columbia Lumber Land

Timber lands in British Columbia are held and are to be acquired in the following ways:

1. By grant from the Crown, which is naturally in fee simple, i.e., timber land has been obtainable in this way, but in 1896 the Provincial Government discontinued this method of handling its timber lands so that now such timber is obtainable only by purchase from the owners.

2. By absolute deed from some railroad company which has obtained a grant of lands in aid of construction of its line.

3. By timber lease or license granted by the Province of British Columbia. Present leases or licenses are in effect, but the Provincial Government by an act in 1908 discontinued the practice and no more leases are to be obtained except by purchase from lease or license holders.

4. By lease from the Government of Canada of lands within the railway belt, the holder of the lease having the right to cut and remove timber subject to the Dominion Government regulations, but has no vested right in the land.

5. By pulp lease granted by the Province of British Columbia. In 1901, to encourage the construction of plants for the manufacture of pulp and paper, the Provincial Government issued leases of pulp wood lands to companies who agreed to enter upon the construction of a pulp mill of the capacity as provided for by the government. The lessee has the right to remove timber to be used for the manufacture of pulp, and it has been suggested by the Forestry Commission that the pulp lease holders, by complying with all the regulations of the land act and after he has completed the construction of a plant for the manufacture of pulp, be allowed to secure a timber license on such timber as he may wish to remove for the manufacture of lumber. The reserve placed on all unalienated lands by the Government practically precludes the securing of further pulp leases.

6. By tanbark lease granted by the Province of British Columbia. The Government, to encourage tanneries, issued leases on timber to be used for tanbark upon the lessee complying with certain conditions. The Forestry Commission has made the same suggestions to the Government allowing and requiring lessees to take out licenses to cut timber from the leaseholds where they intend to use this timber for the manufacture of lumber. The Government reservation applying to leases or pulp leases also affects the securing of further tanbark leases.

7. By hand logger's license granted by the Province of British Columbia. The provision is made by the Provincial Government restricting the issuing of hand loggers' licenses to persons on the voter's list or Indians. It is further provided that no steam power be used in removing timber. The holder of the license has the right to cut and remove timber from unalienated lands in such places as they may designate upon the approval of the Government Timber Inspector being given. These licenses are non-transferable. This tenure, however, is almost negligible, as the number of licenses issued in 1907, 572; in 1908, 30, and 1909, 65, will show. The report of the Royal Commission of Inquiry on Timber and Forestry of 1909 and 1910 recommends that the issuing of such licenses be discontinued.

In addition to the above, the Government has provided that timber owners or the owners of a lease or license can obtain an easement for a right of way 40 feet in width through another lease or license, or through lands held in fee simple by paying the actual damage done to the holder, and failing an amicable arrangement, the damage may be assessed by arbitration as arranged for under the arbitration act.

Timber land in the province and outside the railway belt, and Government reserves which have not already been crown granted or covered by leases or licenses the Government has placed in reserve, and until some new plan is adopted it is not possible to secure any timber from the Government.

With regard to foreshore rights which have not been heretofore disposed of by the Dominion or Provincial Governments, these are now on reserve to the Government of British Columbia, and all rights therein. A lease to the foreshore may be obtained by application being made to the Provincial Government by the owner of the upland,, or providing the lease to others than the owners would not damage or interfere with ingress or egress to the upland.

The booming rights in streams or rights to construct and maintain booms are obtainable from the Dominion and Provincial Governments under what is known as "The Rivers and Streams Act" and "Navigable Waters Protection Act." The right to charge for booming or handling logs is reserved to the owners of the booms and the rates charged are fixed by the county court judge, due hearing having been given to all interested parties.

Riparian Rights

Riparian rights in the province are so inextricably involved with foreshore and booming rights that only a generalized statement may be safely made. Suffice it to say that whereas at one time the Dominion granted to the owner of a foreshore a right, now there is to be obtained only a lease. In the more congested waterfronts of city harbors the question is of importance, as affecting the logging interest, the question of riparian to date has assumed but little prominence. The Government takes the attitude that the logger must be allowed to put his product into tidewater, and protects him in his efforts.

The general contour of British Columbia has a most important bearing on the logging operations therein conducted. The rough, precipitous character of the country almost entirely precludes driving the streams, and thus the use of railroads and almost equally expensive donkey engine or cable-way systems are necessary. The timber has been in great part cut away from the water's edge, and the resultant long haul to tidewater makes the item of expense a serious problem. Logging railroad construction is done on an average cost of about $5000 per mile for grading, exclusive of any cost for right of ways. The rail used is from 45 to 70 pounds, according to the lay of the land and the traffic expected. Ordinary locomotives are employed, both geared and of the direct type, and running from 30 to 70 tons in weight.

Equipment as regards rolling stock is standard. Fuel is of the usual kinds—wood, coal, and oil being in use. The cost of wood in ordinary logging operations is confined to the actual labor expended in cutting and its stumpage value. Coal is of good quality and runs in cost about $4.50 per ton delivered on board the purchaser's scows at the mine bunkers. Oil is gradually coming into use and is to be obtained in Vancouver at from 90 cents to $1 per barrel. Its efficiency and the lessened risk of fire make this fuel quite desirable.

The use of donkey engines in the woods is, of course, familiar and is similar to all Pacific Coast operations. The attitude of the Government in its regulations as regards boiler inspection, both of locomotive and donkey engines, is severe. Frequent inspections are made and licenses are required for all classes of engineers. This has a direct and far-reaching influence on the labor question and results in increased trouble and expense creating as it does another class of skilled labor to be reckoned with.

Yarding Trees Full Length

Yarding trees of full length, and bucking in the water is being done by some concerns and seems to work satisfactorily. The use of overhead cable-way systems has been adopted here and there are several concerns using methods which they have originated and adapted to the conditions which exist in their operations. Lidgerwood systems have been installed in some camps and are meeting with favor.

Rafting Logs

The limited territory traversed by public railroads throughout the province results in the necessity of gathering the product into rafts and in towing to the market. As most of the logging is done at a distance of from 60 to 200 miles from the mills the hazard and expense of marketing the logs can be readily seen. On the coast of Vancouver Island, on Queen Charlotte Sound, and in the Queen Charlotte Islands, the risk of towing logs is so great that at present there are few, if any, logging operations. Owners apparently prefer to wait the coming of proposed railways or market conditions favorable enough to justify the building of mills located within the timbered area, or at points to which the logs can be safely and profitably transported. It is of interest in this connection to mention the fact that our timber in general as far north as the north end of Vancouver Island is more or less mixed in character, consisting of fir, spruce, hemlock and cedar. North of this, and on the mainland, the fir seems to run out, being replaced by the spruce, cedar and hemlock, and operations in fir therefore must necessarily be confined to points south of this apparent boundary line. The average rate for towing logs is about 1 cent per thousand feet per mile, varying from this according to the hazard of the tow or with a haul below or above the average risk. The responsibility of tow boats in case of loss of logs in transit is a matter of arrangement between the contracting parties and there are no fixed rules or customs in this regard. Insurance of logs towed has been undertaken in a few instances, but the rates charged so far have been considered prohibitive.

The rafts are put up in varying sized sections, but usually with one cross stick (or water stick) to every fourth section. The cross sticks on the intermediate sections are drawn over the tops of the logs and known as "top swifters." The boom sticks (or sections of rafts) vary in length from 65 to 75 feet. One-inch boom chains are in general use with 5½ feet of chain exclusive of the long link and large ring. The link and ring are usually of ¼-inch round iron. Weldless steel chains have been introduced, but have not been in use long enough to determine their value as compared with the iron chain.

Government Supervision of Scaling

The scaling of logs is under Government supervision. The scalers are appointed by the Government and the scale in use was established by a commission several years ago. The authority of these scalers is definite and their decisions stand, as in general the Government employees are competent and painstaking.

The class and nationalities of labor employed are similar to all Pacific Coast operations and the wages and general efficiency of the men are about the same as in other localities. A recent ruling as regards the health and efficient policing of camps has not as yet had any effect on camp organization, as the rules and regulations of the provincial health officer have just been formulated.

Specialization and Capital Necessary

In conclusion I think it safe to say that logging in British Columbia is gradually following the general trend of other lines of industry of the period. Greater specialization, more complete organization, and, above all, more capital, are increasingly necessary.

The stumpage value of the standing timber is constantly increasing and timber cannot be procured and logged so as to be sold profitably under market conditions as they have prevailed of late. The logging difficulties are many and available timber is getting further and further away from the water's edge. This condition should be an added inducement to the British Columbia logger to seek a market for his low grade timber and for what is now left in the woods or burned at the mill, in the shape of by-products such as pitch, turpentine, charcoal and asphaltum. There is without doubt great waste in the present mode of conducting logging operations, and some outlet must be found for the material at present allowed to escape practical utilization.

The long tow with the risk of loss en route from the camps to market will always be a serious condition to confront and the business will, for this reason, if for no other, always be hazardous and to some extent unsatisfactory.

The fire hazard on the coast of British Columbia is confined to the cut-over lands, and particularly to the districts traversed by railways. However, the railways are coming to realize that the timber of the country is a source of tonnage and revenue and by greater care and use of oil for fuel the danger from this source can be greatly lessened. The press, however, and the general public seem to be laboring under the mistaken idea that wherever the logger enters the woods fire and disaster follow. He alone bears the loss, if, any, and naturally uses great care in preventing fire which may damage him greatly. It would seem, then, that here is a chance for missionary work among the laity, that they may come to a true realization of the situation as it exists.

A Canadian Forest Ranger

It has always been difficult to understand the difference in mental attitude toward the restraints of the law that exists between the American and the man who lives just north of him, across the Canadian line. In that country it is not considered a hardship to pay either reverence to Nature or a tribute to those in whose charge lies the protection of Nature and natural resources. A thousand miles north of the British line one has seen a fire guardian, the only officer of his kind in a section of country hundreds of miles in extent. A splendid, quiet, self-respecting chap this man was, too; one whose word was law and accepted as such unhesitatingly by red and white. Part of this man's duty was the posting of fire notices, each of which had a good, stiff penalty attached, in all places where human beings, red or white, were apt to see them—steamer landings, fur posts, traders' stores. Nor did this man dread the red men so much as he did the new-comers of the white race, always more careless about fires than were the aborigines.

One day during a steamer voyage this fire guardian saw smoke rising on the horizon far inland from the river on which we were travelling. He stopped the boat at once, got his pack together and went ashore. As he figured it out, this fire was forty miles away, probably at the edge of a certain large prairie surrounded by heavy woods. He would reach it in the afternoon of the second day on foot. He would carry most of his camp kit on his back until that night; then would cache some of it, and would leave yet more of it midday of the next day, cached against his return to the river, where he could get supplies or find the trail in and out of the country. He did not know who had started the fire or what shape the fire itself would have by the time he got to it. All alone, a sturdy and self-reliant figure—representing the law, representing civilization even in the wilderness, representing a decent regard of organized society for the organized society that is to follow us—he set out on foot for his wilderness journey across an untracked country. In all of one's experience with outdoor men, rarely has one met a better, simpler and nobler figure than this one. His profession is precisely that of our own forest rangers. We ought to back these men precisely as an older government backs its young men in an older wilderness than ours.—Saturday Evening Post.

Among the River-Drivers

Great endurance is demanded of the riverman. It is characteristic of them, says a writer in the Outing Magazine, that they accept whatever comes as a matter of course; or, perhaps more truly it is their pride never to show emotion of any sort.

One man was dragged out by the collar from a very dangerous predicament between two parts of a breaking jam. To gain safety, his rescuer, burdened by the victim of the accident, had fairly to scale the breast of the falling logs. For ten seconds it looked like sure death to both, but by a combination of audacity and sheer luck they reached the bank.

Most persons would have paused for congratulations and to talk it over. Not they. The rescuer, still retaining his grip on the man's collar, twisted him round and delivered one good kick.

"There, take that!" said he, and the two fell to work without further comment.

One February, during a thaw, Jimmy Downing, a foreman, fell over a dam into the eddy below. He could not swim, and owing to certain sets of current, growth of timber and lay of ice, no one of his men could get to him.

The water was cold, and sucked with terrific force beneath a shelf of ice at the lower end. Sure death again. But Jimmy, befriended of the gods, hit his knee against a single little ledge. Although half-drowned, he managed to cling there, and after a moment to drag himself out.

Jimmy coughed up a quart or so of water, shook himself, and gazed back at the whirlpool whence he had been so miraculously extricated.

"Confound it all!" said he. "I lost my peavey."

Manufactures at the C. N. E.

With a complete re-arrangement of the exhibits in the Manufactures Building, and an expenditure by individual exhibitors of many thousands of dollars on their displays, the Manufactures Building at the Canadian National Exhibition this year promises to completely outshine its splendid appearance of other years. As usual every inch of space has been taken for months in advance. The Annex is also filled to overflowing, while the Machinery Hall, always one of the most interesting buildings on the grounds, will be filled with the latest labor and power-saving machinery in operation. Many of those exhibits come from Europe, and cost thousands of dollars to instal. All told there are acres of manufacturers' exhibits. It is in this particular more than any other that the Canadian National is without a rival among the exhibitions of America.

THE WOODWORKER

Suggestions from a Consumer of Veneers and Panels*

I do not know of any business which is more difficult to conduct without friction between the manufacturer and the consumer than the panel business. This doubtless is due largely to the fact that this business is done at such long range or through such round about courses as to prevent the producer and the consumer, with comparatively few exceptions, from becoming acquainted. The buyer often does not even know the name of the concern that makes the panels he uses. Many of your members never see the people who actually use the goods you make, and it is seldom that the buyer visits the veneer mill or is personally acquainted with its management. A large part of the panels are sold by commission men or dealers, who, in turn, are not in close touch with the mill. Once in a while the manager may spend a half day, with the dealer or salesman, discussing conditions or adjusting some difficulty that he has been unable to straighten out by mail. Such limited contact does not facilitate acquaintanceship between buyer and manufacturer, nor does it permit sufficiently detailed knowledge of the needs of one, nor the facilities of the other to produce the best mutual results.

My own experience indicates that it is very desirable for the producer and consumer to be in close communication. Little difficulties arise, which, insignificant in themselves to start with, increase and magnify unless taken up right at the time by those most deeply interested.

I do not believe the average panel manufacturer considers the matter of quality as seriously as he should. From the standpoint of the manufacturers, as well as from that of the users of panels, quality is equally important. On the one hand, panels which are not suited to the use for which they are intended contain the cost of all the raw material, labor, overhead expenses and transportation, which is a dead loss when the panels are refused by the consumer. On the other hand, the consumer is put to great inconvenience and sometimes irreparable loss by the necessity of waiting for panels to be hurriedly made to replace the former lot. This means delay and additional expense, all of which the concumer pays in the long run.

One of the most important features of a panel, from the standpoint of the furniture manufacturer, is the matching of the veneer. Drawer fronts and prominent panels must be properly matched. Furniture manufacturers are compelled to make many panels that they would much prefer to buy made up for them, but for the fact that they cannot depend on the proper matching of the face veneer.

More or less trouble is experienced in the separating, or perhaps it might be better stated, in the non-binding, of the various plies of panels. We frequently find panels which, while apparently perfect, will loosen up after a time, and thereby become unfitted for the use to which they were intended.

A point which has been the source of great expense and annoyance to the users of panels is the prevalence of what are termed hair lines. That is, after the surface has been finished and the varnish dried, a slight, almost imperceptible, line will appear in the surface where the veneer has been joined. Some have been able to overcome this to an extent, but it is something that should have a great deal of attention from the manufacturers.

Another source of trouble is where the center of the panel is not of uniform strength or density, thereby allowing the center to indent under the pressure that is applied in gluing. A little care in the sorting of stock centers by intelligent, but not necessarily high-priced, help would materially eliminate this trouble and give more perfect panels from the press.

The jointing of centers where more than one piece is used is important. The center should be well jointed, and on high-class work these joints should be so made as not to be perceptible after the panel is glued up and finish completed.

It is unnecessary for me to go into any detail as to the method of handling glues. I feel it would be out of place for me to do so, for all of you are better informed on this subject than I, but the result of carelessness in the preparation and application of glue is so serious that I cannot refrain from mentioning it. The quality of the glue should be sufficiently high to insure perfect work. When a satisfactory grade has been found, adopt it, and do not be led off by a fraction of a cent lower quotation. I am convinced that much more money is lost in trying to reduce the price of glue than has ever been made thereby. Glue and glue handling is of sufficient importance to be intrusted to some one of a high quality of integrity and absolute reliability.

I cannot refrain from drawing your attention to a practice which I believe is responsible to a greater extent than anything else for defective panels. That is the practice of rushing them through the factory. In most veneer mills great care is taken to see that all centers, faces and backs—the various plies of panels—are thoroughly dry. Expensive machinery is installed to accomplish this, and no pains are spared to extract every particle of moisture before the stock is taken to the gluing department. In this condition the glue is applied. The larger part of the glue solution is water. The various parts or plies of the panels being so absolutely dry and in the best possible condition to absorb moisture, all this water is taken into the wood. While the panel is in the press, or the retainer, there is no way for this water to evaporate. When the glue is set, the panels are removed from the retainers, but are put up in solid piles, with no chance whatever for moisture to escape. They may stand here for several days, and are then taken to the trimmer. They are removed from the pile, trimmed and immediately repiled. Then they go to the shipping room, and are put into crates without separating any more than is necessary in handling. All of this time, you will note, there has been little, if any, time when the panels have been separated, so there could be any chance for the moisture, which has been absorbed with the glue, to escape. I cannot overcome the conviction that panels should be "stuck up" and allowed to dry for some time after gluing, or stuck up in a low-temperature redrying kiln. I fully realize that this would require more factory room, also small additional expense, but I am also as firmly convinced that it would be fully justified and more than offset by the quality of panels that would be turned out.

An item of waste, therefore one of expense, which might be saved by more careful inspection is occasioned by shipping defective panels. This may be done through oversight or with the idea of "taking a chance on their going through." Such panels have all the expenses in their cost, and, in addition, the transportation charges. These defective panels, when charged back by the customer, are counted by the manufacturer as an expense item, and therefore enter into the cost of the product, which is eventually paid by the consumer. This is manifestly unfair, for while it may amount to a certain percentage per annum of the actual expense, it is an unjustified expense, and the consumer should not be asked to stand any part of it.

I note a commendable attitude on the part of some manufactures in using thicker face veneer. This prevents to a large extent the tendency to sand through. While this thicker face veneer is a little more expensive, its use effects a substantial saving because of the greater number of perfect panels and fewer culls. There is a tendency, however, on the part of these manufacturers, to charge a higher price for such panels on account of their thick faces. I do not believe this is justified, for the saving in defective panels is certainly more than offset by the slight additional cost of the thicker face veneer.

Waste in the building up of panels is an important item. The figures mentioned to me by some of the largest and most reliable panel manufacturers are simply astounding. It would appear that such waste was possible only through the utmost carelessness; however, I cannot believe this to be exactly the case. I do think, however, from my own observation, that a part of this waste could be eliminated by selecting veneers which more nearly coincide with the width of the panels or multiples than are often used. This is true in the manufacture of the small quantity of panels that are made in our own factory, and consequently it would seem that even greater economy could be effected in the large volume manufactured by most of your plants represented here.

The matter of standard thicknesses is one which it would seem could be regulated to the great advantage not only of the producer, but the consumer. One factory I know of standardized the thickness of its product greatly to its advantage and at no hardship to its customers. It took a little good, sensible argument and business sense, but in no way lowered them in the eyes of their customers.

As most users of panels also do some veneering, it would not seem out of place to discuss the matter of veneers to some extent as well as that of panels. The object of using veneer is to produce high-class effect at a reduced expense, and at the same time to conserve the product of our forests. In this connection I would call your attention to the fact that figure is the prime essential in veneer that is used for faces.

---

*Read before the Veneer & Panel Makers Association by E. K. Pritchett, secretary of the Macey Company, Grand Rapids, Mich.

All veneer should be cut to show the very best possible figure and the greatest care exercised in making it smooth. Regardless of whether it is sawed or sliced, the smoothness of the veneer is, after figure, the next consideration. You will readily appreciate the fact that where veneer is unevenly cut or badly scored, it must be worked down to the thinnest point. Even if it is cut thick enough, this surfacing occasions waste of labor and material, besides the extra sandpaper and time consumed in bringing it down to a smooth, even surface.

Until recently it was considered inadvisable, if not impossible, to properly slice quartered oak to be used for veneering. Lately, however, rapid strides have been made in this direction and a great deal of quartered oak is now being sliced and used successfully. It requires different handling from the sawed veneer, but where it is properly worked and intelligently used, it is for many purposes extremely satisfactory.

Your grading rules for quartered-oak veneer admit of bright sap without limit. I do not see the logic of this, for it certainly is a defect and a serious one. In lumber 1 in. of bright sap is admitted, but each additional inch is considered a defect in the grade of firsts or seconds, which corresponds to your standard grade.

Taking up the cheaper woods, such as basswood, maple, plain oak, beech, birch, elm, etc., I believe there is an opportunity for much greater efficiency in grading it to meet various requirements. I do not know how far careful grading has been carried, but I am convinced that it is desirable. From a small experience in this line, I would say that standard inspection of single-ply veneer could be made with profit to the manufacturers and advantage to the consumer. It would seem that veneer might be inspected so as to give the customer standard grades of just what he needs, very much the same as is done with lumber. The price, of course, would have to be based on the value of the different grades.

The proper manufacture of single ply veneers is fully as important in the cheaper woods as in the higher grades. We cannot overlook the fact that even though we consider the last mentioned woods rather low-grade and used mostly for centers and backs, it is just as important to have a smooth core on which to place the high-grade veneers as it is that the latter should be properly placed and carefully attached. Too much care cannot be exercised in properly preparing the log for cutting and in cutting it into veneer.

Machine Pointers from Planing-Mill Practice

By H. Watson

Some time ago I received word that a new machine was being made to run quarter-round molding, one that would utilize all the planing-mill edgings right from the edger—without having to rip the waste to any particular size. The machine was to be 24 inches wide, rolls to be sectional and each set to be V-shaped to catch the strips on edge, the top cylinder carrying knives all half-round, while the bottom cylinder carried knives to dress the two straight edges of the mold, the knives being V-shaped and corresponding to the top knives in their positions on the cylinder. This machine was evolved in the office, on paper, at a comfortable desk, but when it got out in the mill it had chills or some other ailment as it has not materialized as far as I have been able to learn.

I made a machine on this order some three years ago. There are two of them here that have been run to make siding, being the only machines ever made that would make cottonwood siding at a fast feed and leave no "whiskers" on it from the sawing, but these machines presented no such complications as suggested in running about twenty odd-sized strips into molding on one machine at one time.

I once read an account of a trial of an inserted-tooth saw, at which the remarkable (?) fact was developed that it required little sharpening, no setting whatever, and ran with less power than a solid saw. This is the same sort of a saw that was described by another man as "one having false teeth." Both these instances are in line with the man that wrote an order for a "tool to make round marks, made with one wooden leg." He wanted pencil dividers.

There was a time when frequent and persistent complaints were heard about the rattling nuisance of loose pulleys. With the number of new forms of this troublesome but seemingly necessary nuisance, the evil is growing beautifully less. For a long time I have neither seen nor heard a rattle out of one of them, though the same number seems to be in use.

This is a reminder of a conversation overheard at the Buffalo Exposition between a mill man and an exhibitor. The mill man remarked that he had no need of the special form of loose pulleys exhibited on the machine. Asked for a reason, he said they had a tendency to tear up a belt by fraying the edges, and in time wore loose on one edge only. The party showing the machine said quite forcibly that "they did no such a darned thing," and, as I found out since then, lost the chance of selling two machines, both of which I have seen, having run across the same man at one of the mills in the South. If I liked loose pulleys ever so much, I would not swear about it to a possible customer and lose my chance of a sale.

A monoply is a bad thing (when we are not on the inside of the benefit) and tends to make some people full of their own importance to the injury of the business. Recently I saw a case of this kind and though it had no mechanical features connected with it, it was in a mill, and might happen to others. A customer, who was just beginning the erection of some machinery put in an order for several small rollers and was promised them in a few days. After waiting ten days and having had to lose two days of his time on account of not getting the rolls, he was told that he would have to await his turn and take his stuff when it was reached. That was not according to his ideas of fair treatment, so he canceled his order for the rolls and gave his order for all his other work to a mill in another town that was more careful of its customers. It is only one of the phases of relations to one's clients.

In this first mill it has been the experience of several to have to take what they can get, when they can get it, and at any price they are allowed to pay, and be thankful they are living. To offer an objection to holdup price is to be as good as insulted. From having a monoply so long, even the "mud clerk" around the place carries out the idea of superiority to all his customers. I expect there are few, if any, equals to this condition in even the smallest of country mills. But this condition only stimulates competition; a smaller and much inferior mill is steadily encroaching on the business of this large mill.

The plan in some of the most modern machines of dressing lumber with the bottom cylinder before it is finished with the top cylinder, and then matched, has advantages that cannot be overestimated, more particularly in a mill that works hardwoods, some of which is oak that may have been on sticks for a long time and be as hard as bone on the surface. From my experience with this kind of lumber, I always prefer to run the rough stock through the surfacer on the worst looking side, and if intended for flooring, as in the case of the last lot I had, rip it to the required width, then run it in the matcher for the finish, in this way getting a first-class job without wearing out half the knives in the mill and doing so much changing knives on the matcher.

But the trouble with this method is, it does not work out on paper, in the office. It is such an easy thing to figure on how fast a big matched can make this sort of flooring, finished at one run, by figuring the product on the lineal feet of feed per minute, but it does come out with the figures all the time, for reasons beyond the control of any operator. In dressing the bottom first, running the stock to a finish at one run, the cut by the bottom knives has to be a light one to avoid making stock too scant, for the top knives to finish, and this light cut in the hard surface soon wears the bottom knives off to a point where they will no longer cut.

As they wear down this way, the front platen has to be changed often to keep them cutting. Then they wear too far down to allow the back platen to carry them properly and there are soon rough spots in the work, then rough ends, and, finally, a new pair of knives and a new setting of the machine. What this hard surface would do to a pair of cutters on a Shimer head would be a plenty. But all this trouble could be avoided and the time of changing saved by sizing the lumber first. But you cannot always make some people see things as they are. A pencil, a tablet of paper, and the authority who does not know but has the right to say, make a combination that has been the undoing of more than one whose knowledge and experience are being paid for at a big price and then set aside by a man who is only on speaking terms with mechanical knowledge and planing-mill facts.

Changing machines from one setting to another is not the most agreeable of tasks, yet there are mill owners who think it is all in a day's work and ought not to take any of the running time of the machine. I have been having a little experience along that line that has kept me in hot water for several days. I have changed a machine from siding to flooring, and then to double-beaded ceiling five times in one day, without completing a single item on any of the orders, and then repeat the dose the next day to clean them up, all on account of a fidgety manager, who did not know what he wanted nor how he meant to get out the orders. This is one of the diversions that line the path of those of us of the shaving fraternity.—Woodcraft.

Why Band Resaws Heat and Run Back

A correspondent asked some one to explain why his saws heat and run back in stock 6 inches wide and yet stand up and do good work in wide stock, says B. R. Lewis in the Woodworker.

As many have explained in these columns before, if one is not perfectly familiar with the conditions under which a band saw is being operated, it is somewhat inconsistant to give out any hard and fast rules for coping with a difficulty; given in all sincerity, they would hit one case to the letter, yet in another case be misleading altogether.

Once I took a position where they had been having some trouble with their resaws—nothing serious, just little things, but they seemed numerous and plentiful. The saws, I found, had fairly good tension, yet extremely uneven, and when I got them evened up and properly leveled I found they had a little more tension than was really required for the work we had to do. But one of the strong lines in my curriculum of doing tension tells me to never roll the edges to undo work, if it can possibly be avoided, for there is only one way these conditions can be brought about, and that is by overdoing the work along the central portions of the saw, and each time work of this kind is overdone and let down again, trouble is sure to accumulate. However, we put the above-mentioned saw on, and, sure enough, it did good work on wide stock, but when the sawyer got some narrow stock it did not show as good results on the same feed. Of course, the sawyer wanted my opinion. We increased the feed nearly 150 per cent., and the results were equally as good as on the wider stock with slower feed. The theory is, a great amount of tension, especially in thin blades, calls for heavy work to keep the saw straightened out, so to speak. Too much tension for light work is as resourceful of bad results as too little tension for heavy work.

If this correspondent's saws run back in stock 6 inches wide on a feed of 75 to 85 feet per minute, that would be good evidence that the saw was getting hot along the back, which might be caused by the rolls of the feed gear being slightly out of line with the saw, and the stock bearing ever so lightly on the back part of the blade, in passing out of the machine, would eventually work out a tendency to heat and run back. But if this tendency to run back showed only on a very fast feed—we will say 120 feet or more per minute, and we will assume the rolls were in perfect alignment—then the cause might be attributed to the teeth being too short, and instead of the saw clearing well, the sawdust was working back between the stock and blade, which usually produces more heat along the middle and back portions of the blade, which, of course, would allow it to draw back on the wheels. Also, if the teeth were too straight and too short—or even long enough—an extremely fast feed would push it back anyway. If the teeth were too short, an extremely fast feed would push it back, because the stock being fed faster than the teeth they could make the cut and clear themselves, and if they were too long, or even long enough, too fast feed would tend greatly to throw the saw back on the wheels—and, no doubt, for retaliation, the saw would chop out a few washboards in the meantime.

While the above-mentioned conditions might show up decidedly on a fast feed, yet on a slow feed the saw would do fairly good work. But there is no doubt if one should watch the saw closely, he would be able to discern the tendencies there at all times, whether in wide or narrow stock, or on a slow or fast feed.

Another cause may be that the bottom guide is set so as to hold the front of the saw to one side and the back in the opposite direction, while the top guide might be set straight or to the opposite of the lower guide. In either case the saw would be held in a slightly twisted condition. While this condition was extended out to 24-in. to 36-in. it might not show up materially on a slow feed, but bring those same guides down to within 7 inches of each other and the twist would be very pronounced and the bad results would show up decidedly on a fast feed.

If the saw should be hanging up on ever so slight center-line, especially on slightly crowned wheels, a thin saw would show many antics that a heavy, wide saw would not show in any way. In case of the teeth being nicely fitted with extreme hook, the saw would be as liable to draw forward on a fast feed as any way, yet would not hold its position well at any time; but on a slow feed, in reasonably wide stock, the extreme hook would in a measure offset what support the saw lacked because of the center line, and do fairly satisfactory work.

A little looseness of a wheel on the shaft will inspire a saw to cut a few fancy figures, and will very soon put a nicely-running blade out of commission. A very little unnecessary end motion in one of the journals will very soon work a saw into a condition so it will be impossible to hold it up in the cut.

We could go on almost indefinitely and enumerate probable causes like these, and perhaps after all not hit the identical cause of this gentleman's trouble, yet no doubt some small thing of rather minor importance is the cause, rather than some of the more common causes of trouble we encounter. While a heavy machine doing light or medium work possibly would not feel it at all, a light machine and thin saw doing heavy work would possibly show bad results at once.

Resaws properly fitted, on a machine in bad repair, will not give good results. Poorly-fitted saws, on a machine in excellent repair, cannot do good work. But well-fitted saws, on a machine in good repair, will always give good results; no matter whether the stock is 6-in. or 26-in. wide, the saws will always hold their position on the wheels and cut straight lines. And if one looks after the finer points closely when caring for thin band saws, he will be well repaid for his efforts.

Mastering the Wood

To-day the user of wood is confronted with many problems which he did not have to face a few years ago. Many are constantly offering new varieties of wood and claiming that every one is suitable for all kinds of work.

Each new kind naturally possesses properties peculiar to itself and the treatment which it receives in each department of the factory should be determined by these qualities. Too often a manufacturer receives a shipment of one of these new classes of wood and submits it to exactly the same treatment he has been giving to the product previously used. This is not fair to the new wood for its physical properties should be studied and the proper treatment accorded to it.

In the seasoning of wood there is greater variation than almost any other branch of the industry. Wood varies as to grain as well as structure. This determines the treatment it must receive in the dry-kiln. The stock must be put through the kiln at the proper rate and given the right qualifications as to humidity if it is to go out in the best condition for subsequent work in the factory.

When experimenting with a new lot of wood it is well to take small samples and test them in every respect. Sometimes a small sample is put through the dry-kiln with other stock and then experiments are made to see how dry it is, what its gluing qualities are, and how it will take finish. This procedure may have to be repeated several times in order to obtain the proper information as to the best method of handling the stock.

A preliminary examination of the stock under the microscope will give information as to its cell structure and the amount of filling material in the cells. This has a marked influence both on its drying properties and on the facility with which it will take finish.

When planning how best to use a new wood all of the information possible should be obtained concerning it before it is used in making up the regular product of the factory. If this is not done the wood is not given a fair chance. There should be a man connected with each plant whose business it is to study new sorts of wood, the finish materials, glue and other supplies, and see that they are all kept up to the standard.—Wood Craft.

B. C. Forests Experiencing Dry Season

"While the province has been exceptionally free of forest fires so far this season, considering the dry condition of the forests in many parts, it is only by observing the utmost care that outbreaks can be avoided in some districts.

"In some districts the conditions existing at present are such that should a fire get started it will be only with difficulty that it will be possible to prevent great loss. The department, of course, has a large force of fire wardens out through the province patrolling the different districts night and day, but one careless act on the part of an individual could start a fire that might cause great loss of both life and property before any effort we might summon could stay its progress.

"We have about 120 wardens on our list, but, of course, in a province such as this is, there is plenty to keep them going without having to fight fires. They are continually on the patrol, providing permits and doing other work. It is so easy to prevent a fire occurring, but once it is started all the men we could muster would find it impossible to quench it in some districts."—W. C. Gladwin, Chief Fire Warden, of British Columbia.

The importation of lumber of all kinds into St. Vincent, West Indies, including shooks, staves, shingles and spars, were valued at £7,223 last year. For 1909 and the two preceding years the importation was, respectively, £3,634, £9,763, and £7,204. The special feature last year in the wood trade was the large importation of white pine and spruce.

(Continued from page 33.)

Who pays that interest? Mr. Consumer. If the investment is doubled by the accumulation of a lot of additional items for which there is little demand and a surplus of stock which the trade does not justify, does not the amount of that interest item necessarily increase, and must not Mr. Consumer pay that increased item in higher prices for the lumber which he buys?

No, we would not wrong our trade, but benefit them. We would not increase the margin between buying and selling price, but decrease it, if anything, and lastly, but still of some importance, we would not allow our business to continue in a half-hearted, half-possible way, but make it prosperous and satisfying.

In closing allow me this one suggestion. Go home and take a walk through your own yard. Compute as nearly as possible the amount of dead stock you have. By dead stock I mean not only the worthless old junk which has accumulated, but that excess of good, saleable lumber which is not necessary to supply the present demand. After making this computation in feet, reduce it to dollars and cents and you very probably will have a good surprise on hand. Then go out again and classify your stock, at least approximately, into three divisions.

First, the good, bright, saleable stock in amounts not exceeding present needs.

Second, regular items of stock in excess of present needs, but in reasonably bright and saleable condition.

Third, the old black lumber in all grades and sizes. Excess amounts of short lengths. Small left-over lots not in demand and comparatively unsaleable. Six months old lime, plaster and cement. Old and defective millwork and any other unsaleable material which you have on hand.

The first division will take care of itself.

Keep the items of the second division constantly in mind and push the sale of them hard and constantly until they are eligible for entry to division one.

Hang out the bargain sign on the third division and make a price which will move it rapidly, regardless of what that price is. Clear your yard of it within a reasonable period at any cost.

This done your investment will be reduced, your yard will be more inviting and not only the air, but the reality of prosperity will pervade your whole business.

The Red-Tape Worm

The reader will undoubtedly wonder at the title of this article, and if his curiosity should be exercised enough to prompt him to read further, he will agree with me that I have taken the most descriptive word in or out of the language to express in a single word that which has been and is still eating up the profits in many retail yards, writes J. D. S. in the Pioneer Western Lumberman.

I heard two lumbermen talking about Smith & Jones going out of business and the concensus of opinion was that they had too much system; that their overhead expense was too large, although it was admitted that nobody was idle in the office.

Smith and Jones were formerly connected with a wholesale house, knew all about cost system, could tell you just where each penny went.

They were not very long in the retail business before they began to wonder what ever possessed them to leave their lucrative positions with the wholesale house.

Smith & Jones were hustlers, they could get business at the prevailing prices.

They had competitors who would never be personally considered in the same class with them if the business engaged in were a wholesale one.

Let me describe to you the manner in which the books of Jones and Smith would chronicle another version of the history of a two-by-four.

If you wanted a stick of this (much written about) sized lumber, say for instance, that you wanted it surfaced—you would telephone to them and the order clerk would put you on the estimator's wire and he would tell you that the stock was selling at $19.00 per thousand feet and would have to add two dollars per thousand for surfacing.

He would then have the order clerk put on the wire and he would take your order for, say, two pieces of 12 feet and one 16 feet long.

You sent your man and team after this a few hours later for which time it had been promised and the order clerk informed you that he would have it ready shortly, as they were very busy and would you please wait awhile.

The order clerk sends the office boy to the other end of the yard to tell tally-man So-and-So to get this into the mill.

Up to this time the system evolved by the senior member of the firm had required three records to be made of this order.

The tally-man is given a tag and makes another for the millwork to be done, then gets a team to deliver same to the mill.

The order has now become a rush order and the mill-man stops such work as he may be running and does the job and gets the mill tag, which of course must go through the office.

The tally-man turns in his tally sheet which must be checked by somebody and then the lumber is charged and later a bill rendered, and still later, the collector makes a few calls.

As near as can be estimated the cost of handling this order will be about fifty cents, allowing for the office and yard help engaged in handling and recording this transaction.

The margin on this order was ten cents, and of course the expense on larger orders would be reduced in proportion, but what I wish to show is the extreme loss incurred in a retail yard with a complicated system which would probably be just the thing for a wholesale yard making car or cargo shipments.

This stricture which I make in reference to the above transaction applies to an order of 500 feet, and is best exemplified by the fact that in the case of Jones & Smith, where their office force equalled the number of men engaged in handling in the yard, it finally caused them to go out of business.

Jones & Smith had a competitor—an old timer, whose yard was much smaller than theirs, and whose name, let us say, was Brown.

If you sent to Brown's for the same stock you would walk into the shed and a tally-man whom you found there piling lumber, if slack, or getting out an order, if busy, would find and tie up just what you wanted in three minutes, make you sign a receipt which he made out on a triplicated machine and he would turn to wait on the next customer.

Brown conducted a retail yard as a retail store would be conducted. Smith & Jones conducted their as a railroad office is conducted.

Brown kept his own books, was always on his own ground when you came around; you saw what you were getting; your wants were anticipated, your time was saved as well as Brown's, and you went back to Brown's another time.

There are right in this vicinity large yards which carry on a wholesale and retail business, both under the same system, with enough red tape prevailing in the retail end of the business to eat up the wholesale profit as well as the retail.

If you have a large yard, such as mentioned above, reserve one-twentieth part of it for your retail or your petty trade. Turn over your small orders to your petty yard. Have it conducted by a man with a financial interest in the same and cut out practically all system in this yard and it would show a profit.

By conducting it after the manner of Brown's with every conceivable want on hand in small quantities, you would eliminate much of your office work and also your yard work.

A customer can afford to pay five dollars per thousand feet more for his lumber in small quantities, if by so doing he saves more than enough of his own time to make up the difference.

I am of the opinion that, as lumber is such a bulky commodity, costing so much to handle and requiring so much care to prevent degrading, it should be accompanied by the simplest possible system even in the wholesale end.

Let me venture to say that if the retail trade was the one which I were about to embark in, I would Out-Brown Brown.

Lumber Used by Furniture and Car Manufacturers in 1910

Statistics of the lumber purchased by Furniture and Car manufacturers in Canada in 1910, have been compiled by the Forestry Branch of the Department of the Interior. 117,893,000 board feet of timber were used, worth $2,987,210, at an average value of $25.35 per thousand; of this 65 per cent. was native wood at $20.82 per thousand while the imported wood cost $35.86 per thousand. Ontario was the principal consumer, using over 50 per cent of the total amount. About one-third was used in Quebec and the remaining 15 per cent. was consumed in Nova Scotia, Prince Edward Island used a negligible quantity. The timber used in Ontario, both native and imported, was more expensive than in the other provinces, while Nova Scotia is a particularly cheap lumber province.

Yellow pine and oak are the most important species used by these industries, forming over one-third of the total consumption. It is regretable that all of the yellow pine and 95 per cent. of the oak has to be imported from the United States. Great credit will be due to any manufacturer who supplants these two species with native wood. However the next ten species in importance, maple, birch, spruce, pine, basswood, elm, ash, beech, douglas fir, and hemlock are native woods and practically make up the remaining two thirds of total consumption. Thirteen other species are used in small quantities. Statistics of various industries thus collected are expected to be a benefit to private owner, timber seller and manufacturer by giving a better understanding of volume of business done, value of species and markets.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

White Pine Timber Wanted

Tract of two to five million in Ontario. Principals only. Apply Box 307, care Canada Lumberman, Toronto, Ont. 16-17

WANTED

Cash paid for green clear Maple axles 4¼ in. x 5½ in., 6, 12 or 18 ft. long. If you can get out a carload or more write us. Warren Ross Lumber Company, Jamestown, N.Y.

18

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Tank Lumber Wanted

We require 2-in. and 3-in. Tank White Pine, 6-in., 7-in., 8-in. and 10-in.; 10 ft. to 24 ft. Also red pine. Highest prices for Pump Squares. Ontario Wind Engine & Pump Co., Ltd., Toronto, Ont. 7-tf.

White Pine Pickets Wanted

We want at once 4-4 x 4-4 x 44 in. and 48 in., 5-4 x 5-4 x 44 in. and 48 in., and 6-4 x 6-4 x 48 in. White Pine Pickets. If you have anything in the above write, stating quantity, when cut and best prices. Will buy any quantity from a car to your entire stock. Box 58, Ogdensburg, N.Y. 20

Wanted White Pine

30 M. 1 x 8 x 16 ft. common and better.

40 M. 1 x 10, 12, 14 and 16 ft. common and better.

60 M. 1 x 12, 12, 14 and 16 ft. common and better.

20 M. 1½ x 8, 10 and 12 in., 12 14 and 16 ft. dressing and better.

Box 309, Canada Lumberman, Toronto, Ont. 16-16

FOR SALE—LUMBER, ETC.

Pulpwood Etc. For Sale

A party in Quebec Province wants to hear from firms, Canadian or American, that would buy pulp, lumber or ties. Apply Box 315, Canada Lumberman, Toronto, Ont. 16-17

For Sale

100 cars Longford Hemlock, assorted sizes.
100 cars Whitney Spruce, any width.
25 cars Ravensworth Birch, 1 in. and thicker.

Apply to Quincy Adams Lumber Company, Limited, Longford Mills, Ontario. 14-17

For Sale

300,000 feet 1 inch Birch.
250,000 feet 1¼ in. to 3 in. Birch.
1st and 2nd and No. 1 Common from three to six months on stick.

ROBERT STEWART, LIMITED,
13-16 Guelph, Ont.

For Sale
Hardwood and Hemlock

If you want to buy Hardwood or Hemlock or Ties, Posts and Shingles, visit limits and make an early contract. Pay as work progresses. Can get you 5 or 10 million feet of each on Georgian Bay. Box 266, Canada Lumberman. 9-16

Lumber for Sale

One car hard Maple and Beech, clean dry stock, cut 1½ and 2 in. squares in lengths of 20 in. to 4 feet, also a quantity of
1 x 2 x 26 in. Beech and Maple, clear.
1 x 2⅛ x 28 in. Beech and Maple, clear.
1 x 2 x 36 in. White Basswood.
2 x 2 x 18 in., 24 in., 28 in., long oak squares.

For further particulars write or see

P. D. CAMPBELL,
13-16 Newbury, Ont.

FOR SALE—MACHINERY, ETC.

Machinery For Sale

Carver, 4 spindle Rohlman.
Two cut-off saws, railway, wood frame.
Dovetailer, Boults.
Floorer, 9-in. Berlin.
Planers, 24-in. single belted.
Jointer, chair seat, Jenkins.
Moulder, 6-inch, Houston.
Mortiser, hollow chisel, Greenlee.
Mortiser, Smith.
Mortiser, bit.
Saw and Dado machine, Williamsport.
Sander, double 24-inch, Perry.
Sander, 42-inch three drum Boardman.
Sander, 42-inch three drum Columbia.
Saw gummer, Rogers.
Saw-mill, band 63 inch wheel.
Engines and boilers, various sizes.

O. L. PACKARD MACHINERY CO.,
Milwaukee, Wis.

WANTED—MACHINERY, ETC.

Matcher Wanted

Second-hand, in good condition. Describe. Name, maker and lowest price. York & Sunbury Milling Company Limited, Gibson, N.B. 14-15

WANTED—EMPLOYEES

Advertisements under this Heading two cents a word per insertion. Minimum charge 50 cents

Lumber Inspector wanted, at once, reliable, experienced hardwood inspector and shipper. Apply with references by letter only, to Great Lakes Lumber Company, Limited, Owen Sound, Ont. 16-16

AGENTS WANTED—United States firm manufacturing saw mill, well drilling and prospecting machinery, desires to secure Canadian agents. For particulars write E. J. McIntyre, 4059 Perry Street, Chicago, Ill. 15-16

Planing mill foreman, steady work, good wages to man who has a thorough knowledge of matchers, planers, band resaws; planing in transit our specialty. Man wanted who can keep machines running and turn out good work. Apply,

The Tait Carss Lumber Co., Ltd.,
16-16 Orillia, Ont.

GENERAL SUPERINTENDENT—Large Western concern, English capital interested, wants first-class man as superintendent and technical adviser, Canadian preferred. Must be active man with thorough woods experience, knowledge of business side, thoroughly abreast, up-to-date ideas of forest management. Responsible position. Applications must be accompanied by full statement of experience, supported by copies of all testimonials (instead of references) and photograph. G. FINCH, Box A. V. 242, The Oregonian, Portland, Oregon. 15-16-17

WANTED—A competent Pine Lumber Inspector, accustomed to grading for the Ontario market. Apply, stating salary expected and giving references, to the Sheppard Lumber Company, Limited, Waubaushene, Ont. 14-17

Foreman Wanted

Foreman for planing mill, man to be capable of taking charge and keeping in first class running order all machinery in same and to be able to get out work from plans and details in connection with house and other buildings. Address, Laird Bros., Dresden, Ont. 16-16

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. ten cents extra. Minimum charge 25 cents

Scotchman desires situation in woods year round. Understands thoroughly work at Depots, Keepovers, etc. First class bookkeeper. Mill and wood experience. Apply Box 312, Canada Lumberman, Toronto, Ont. 16-16

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

BUSINESS OPPORTUNITIES

Mill For Sale

A first class mill, well equipped and excellently situated on Lake Temiskaming—fine shipping facilities—immediate sale. Apply to P.O. Box E., New Liskeard, Ont.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

FOR SALE—As a going concern, the Markdale Veneer Works, 7-foot Panesville, Rotary Machine, with complete outfit and power. Large Cement Vats, Drying Racks, neat buildings. Plenty of yard room; convenient to C. P. R. station.

MARK ARMSTRONG,
16-17 Markdale, Ont.

Here is a Snap

Saw Mill and Timber Limit for sale, on Grand Trunk Railway. Easy to lumber limit, contains four to five million feet mixed timber, besides a large quantity of standing and lying dry pine; two million feet free from Crown dues. Mill now running, equipped with trimmers, double edges, slash saws, lath and shingle mill. Price 8,000. It won't cost much to come and see this outfit; it is a bargain. Write Box 37, Barry's Bay. 14-17

For Sale

Timber and Timber Lands, Saw and Shingle Mills, Etc

Some 2,000 acres, greater part virgin timber, situate on Temiscouata Railway, Township Witoworth, P.Q.

Eighteen miles from Riviere du Loup, Station on Intercolonial Railway.

These lots of lands consist of White and Black Spruce, Hemlock, Maple, Birch, Cedar, Ties, and thousands of cords of pulpwood, etc., with saw and shingle mills actually in operation and in complete order.

These are Crown granted lands, including about 30 acres cultivated land and divided by half each side, face to face, by Temiscouata Railway, with siding two hundred feet from the mills, dwelling houses, other buildings. No export duty to be paid. Apply to

I HAVE FOR SALE ON THE PACIFIC COAST

In Tulare County, California. A choice compact tract of 275,000,000 feet of redwood and 125,000,000 feet of sugar pine, nicely located to operate and can be marketed in Los Angeles, California. I want a buyer in the next six weeks. Can be bought at a bargain.

L. VAN WINKLE,
14-17 Santa Monica, Cal.

Circular Saws Out of Round

A fruitful cause of circular saws doing bad work arises from their being allowed to get out of round or balance. To be in perfect condition each tooth must be absolutely uniform in shape, length, set, and space, so that each one will take its fair share of the work. If a saw is allowed to have teeth of unequal length the long ones are subjected to undue strain, and fractured teeth and inferior work are often the result. The saw being allowed to get out of balance is also one cause of cracks, as, should the points of several teeth crumble off, the next has to take the undue strain, and cracks are set up in the gullets, especially if they are angular. Every tooth should be sharpened and set exactly alike, and all the points touch a stone or guage when slowly revolved. If a large circular is only very slightly out of round the centrifugal force set up by the high speed will often cause indifferent work.

Box Shooks and Lath

For utilizing to the best advantage the by-products and odds and ends from the sawmill production, it looks like box shooks and lath should make an excellent combination. That is, there should be more of them made in common and alternating rather than for a mill man to exclude the one and feature the other.

When a man equips for lath making he generally sticks to lath exclusively, and when he equips for box shook making he generally ignores the lath end, and depends on his box shooks or crates exclusively or these and some form of dimension lumber.

Quite a lot of the material used for lath will make box shooks and vice versa. And this is perhaps the explanation of why people are given to handling one or the other of these side lines and not both together. Both together would mean some conflict in the way of raw material supply, yet, on the other hand, it should mean opportunities to use up closer the off-fall, and last but not least a chance to push heaviest on that product which for the time being is most in demand.

Take the present situation, for example, with a good demand for lath, especially from the South country, and a man with this double equipment might well run heavy on the lath side and light on the box shooks for the time being, thus using up a lot of the material in lath that might go into boxes.

Then, perhaps, later on when the lath supply is overdone, there may be urgent demand for box shooks and crate strips. Then the lath end can be let up on and sometimes a part of the lath machinery may be used for making crate strips, such as cabbage crates and various crates for packing and shipping farm products and more realized for it than can be gotten out of lath. In both of these side industries much of the chance for profit depends on the market conditions at the time, and if market conditions continue fluctuating for six months in the year, one may have a good demand for box shooks and crating stock and do fine with it, and then for the next six months it may be possible to sell the output and get a profit for it. Then, meantime the sawmill continues producing odds and ends that need taking care of, so the margin of profit is trimmed close and things kept moving.

It is the same thing with lath machinery. It looks like, though, it could be a different story by having a different combination for lath making and box shook making machinery. Then, one could push heaviest on that particular product which for the time being was most in demand and vary the work more or less according to the changes in the demand and the chances for profit. Meantime, too, it would help materially in making a closer clean-up of the off-fall, because some stock will make crate strips and box shooks that is too short to make lath. Some other stock will make lath that is too narrow to make box shooks, so it really looks like an excellent combination for a side issue to sawmilling, that is, an equipment to make both box shooks and on the face of the joint. To make a good joint where the covers are drawn up by the bolts and crossbars the iron faces of the joint should be made dead true, and a thin packing only be used, as it will stand better than a thick one. Indiarubber jointing material is not to be recommended, as the heat often causes the rubber to partially melt and attach itself to the joint surfaces. Some boiler insurance companies recommend flat asbestos boards with interwoven wire gauze for this purpose, as it will stand considerable heat and pressure without deterioration, and allows of a true thin joint being made. For externally bolted manhole-cover joints a very convenient form of joint can be made by using an ordinary ¼-in. bore lear gas pipe, the one end being tapered off, whilst the other is widened out for the reception of the tapered end. This forms a very close joint. Whichever form of jointing is used, the jont must always be made within the bolt circle.

In locomotive and vertical boilers, in which the joints are frequently disturbed for washing out, a good plan is to use asbestos rings the exact size of the joint face. The ring should be coated with blacklead, and may be used several times over. For internal mudhole covers some engineers also recommend a cast-lead ring about ½ in. thick. After the joint is made and steam is being raised the nuts should be gradually tightened up, as the increased pressure often further compresses the packing and loosens the nuts somewhat. Before a joint is broken the safety valve should be opened, and care taken that the boiler is entirely relieved from pressure.

Four-cutter Moulding Machine

"S. K. P." asks: "Which type of moulding machine do you recommend as best suited for a small jobbing mill—an outside or inside feed machine?"

In reply, the Timber Trades Journal says: "In a jobbing mill where there is a constant change in the work and much setting up is required, we think an outside feed machine would suit your purpose best, supposing the work does not exceed, say, 7-in. wide. See, however, that the blocks are supported by extra long bearings—some makers now fit an adjustable outside bearing to the top block—and run with absolute steadiness under a full load, otherwise the finish of the mouldings may not be so clean as in a centre-feed machine. With an outside feed machine with movable blocks much time can be saved in adjusting and setting up, and bevelled adjustable feed rollers can be used for working sills, mouldings, etc., which are sawn on the cant, which cannot be done on a centre-feed machine. For heavy work a centre-feed with angling top cutter-block is the best machine.

Review of Current Trade Conditions

Ontario

The lumber trade throughout the province of Ontario has reached its annual dull season. The farmers, being occupied exclusively with their crops, have no time to devote to anything in the way of improvements, and the result is that retail yards are nothing like as busy as they were a month ago. In Eastern Ontario this is especially the case. In Western Ontario, however, with its large manufacturing centres the lumber trade is fairly active.

A large manufacturer of the Georgian Bay district speaking of the outlook says:—"Trade is fair and we are going to have a cracking good fall business. Stocks in the hands of all retailers are low. Everybody has been cleaning up for a month or so, getting things in shape. The legitimate demand at present is good, and there is going to be more. The car shortage is already in evidence and people are foolish that they do not buy faster then they are buying, at present. By the middle of September the mills will not be able to accept their orders, by reason of the extensive demand for the cars. At present there is a good demand for this time of year, and it extends pretty well throughout all lines of lumber. Stocks are being held firmly by manufacturers, and wholesalers. Hemlock is the only inconsistency, and an upward tendency is likely to develop this fall. It is pretty generally conceded that the supply of hemlock is about what it was a year ago. This year's new stock will be about what it was last year. There is very little new stock now, in the hands of manufacturers. Stocks in manufacturers' hands, in fact, are quite badly broken, and as soon as the Fall buying commences, trade will improve, and prices will stiffen. The lath market is quiet."

While the above opinion upon market conditions is that of a manufacturer who naturally hopes for a strong market, it is not unreasonable to believe he is pretty near the real facts. Travellers report generally that although the trade is dull there are good indications that the fall buying will be on an extensive and satisfactory scale.

Eastern Canada

The building activity at Montreal is assisting the lumber trade considerably. The export trade is also satisfactory. Prices are firm, with the exception of white pine, which is inclined to give way slightly. Spruce is selling well to United States markets. Hardwoods for the English markets are also moving well.

Eastern spruce at Boston is rather quiet, the volume of trade being small. Stocks on hand are ample for the current demand, though an improvement in the demand is expected in the fall. It may be stated that the tone of the market is a little steadier although prices are unchanged. A few manufacturers are asking $23.50 for frames. Only a moderate demand is reported for boards. The movement of randon is slow. The demand for hemlock is quiet but manufacturers are obtaining fair prices for dry eastern boards. Eastern clipped boards are selling at from $19 to $19.50. Cedar extra shingles are quiet at $3.35 to $3.40 and choice brands are offered at $3.50 to $3.55. Lath continue quiet and unchanged. The price of 1⅝ inch ranges from $3.70 to $3.75 and 1½ inch from $3.40 to $3.50. The demand for Eastern spruce at New York is rather dull though the suburban trade is improving. Prices are still unsatisfactory. Hardwoods at New York are slow and dull. Plain oak, ash, maple and birch of the better grades are, however, in good demand and strong. The weakest feature is quartered oak. Heavy competition is affecting the demand for hemlock at New York.

Great Britain

There is no change to note in the c.i.f. values of spruce deals in Great Britain. The market is, in fact, unusually steady, without any sign of fluctuations one way or the other. The probability is that prices will remain steady for some time. The spot demand is not very active, and it may be that it will have an effect sooner or later upon c.i.f. values. There is a good movement of stocks from the quay to consumers' premises, as a result of contracts made for goods to arrive. If the demand should improve at all there is a likelihood that a scarcity may develop. The market is in quite an interesting condition, and will repay careful attention. 3 x 9 deals of good quality are somewhat scarce, and a little stronger. This is caused by the fact that most of the Miramichi and Campbellton 3 x 9's are going inland. There is a slight scarcity also of 2½ x 7.

No improvement can be reported in the spot market at London, business being in rather a dull condition, and of a piecemeal character. Values appear fairly steady, but there is an inclination in some instances to accommodate buyers with lower prices, if a large order can be obtained. This is the case especially in batten sizes. Deals and floorings are steady, and so are common white and spruce.

The deliveries at London for the week ending July 22nd, totalled 12,199 standards, as compared with 6,525 standards during the corresponding week of last year. At Churchill and Sim's recent auction sale, 3 x 5 spruce 10-15, brought £7 15s., and the same price was obtained for 10-13, 3x8, 12-13 sold at £9 15s., 3x7, 11-13, brought £9 10s.; 3 x 6, 12-13, £9, and 3 x 9, 11-13 and 10-13, £10 and £10 5s. respectively. A lot of 1 x 8, 9-18 pine thirds brought £8 10s.

At Liverpool, the trade is still feeling the effects of the recent labor disturbances. Various classes of timber goods which were hung up at the time, are still unmoved, and recent imports are also moving slowly. The market for St. John birch logs and planks is unchanged. Supplies are reported to be plentiful, and prices to be about steady. There is a fair demand for prime Quebec boards of 1-inch and upwards. The c.i.f. market for Quebec and red pine remains very firm, with spot prices in harmony.

United States

There is practically nothing in the lumber trade in the United States that it is possible to call a feature at the present time. No decided changes, one way or the other, are to be noted. There is possibly a slightly better enquiry for Southern pine west of the Mississippi and in the Mid-Western States north of the Ohio River. An improvement which is just perceptible may also be mentioned in the hardwood business at Ohio and Mississippi river points. Practically all through the present season retail dealers have been buying from hand to mouth. The crops are now commencing to move and a little more money is in circulation in the farming districts so that it is to be expected that there will be from now on a gradual improvement in the buying tendency. No decided improvement in the actual demand, however, can be looked for until the beginning of September. The crop situation continues a matter of much concern and is being followed very closely by the lumber trade. The most that can be said at present is that there is a fair to large aggregate crop to be expected, rather unevenly distributed. The country lumber trade will, as a result, probably be rather spotty.

A noticeable feature of the lumber trade, as the season developed, has been an increased demand for low grade stocks, which is the case in nearly all classes of woods, particularly, however, in the hardwoods. The white pine trade continues firm and steady with a moderate demand. It is quite good at Pittsburg and receipts at the Tonawandas are plentiful with a quiet demand. A quiet trade only is in progress in the Saginaw Valley. The trade in white pine is of a vacation nature with firm prices and a good outlook for the future.

Chicago:—Stocks of white pine are scarce and prices firm. Hardwood dealers are rather dissatisfied. Orders are in fair volume but are for small quantities and immediate delivery. The manufacturing demand is dull. Plain sawed red oak is the strongest feature among hardwoods and is scarce. Quarter sawed white oak is plentiful and has an easier tendency. Birch and maple are selling well and are firm. Basswood is dull. Hemlock is recovering very slowly but the improvement is quite noticeable and is expected to continue. Hemlock prices are about $1.00 higher than they were a year ago. Mills are reported to be pretty well stocked. Conditions are promising for a continuation of the improvement. A gradual broadening of the market for western pine is reported. The volume of business in southern pine is increasing and prices are steady. Enquiries are numerous. It is believed that an increase in the demand will have a tendency to strengthen prices. Indications are that the market for yellow pine will be very satisfactory in the fall. The demand for red cedar shingles is dull. Clears are bringing $3.12 and stars $2.59, Chicago basis. White cedars are fairly active and firm. Lath are in steady demand at unchanged prices. The cooperage market continues about steady.

Buffalo:—Receipts of white pine by vessel have been plentiful right through the season and stocks are now ample in most grades. Pine, common and high grades, however, are not any too plentiful. Trade in general is dull. The export demand at the present season has been quite equal to the domestic. Prices in general continue steady and the better class of stock is selling well. A dull trade is reported in hardwoods but the outlook for fall business is encouraging. The yards have good assortments of stock in most lines. Oak, plain and quartered, is among the leading

woods. The demand for plain oak is better than for quartered. There is a fair demand for maple, birch and chestnut. A fair volume of trade is reported in hemlock, but prices not not satisfactory as receipts are too plentiful. Prices of yellow pine are well maintained and trade is about steady.

Saginaw and Bay City:—There is no feature of importance in the northern pine trade though the demand is sufficient to keep the mills and factories in motion. Prices are steady.

Market Correspondence

Timber Trade in the United Kingdom—"Holding up" the Trade

Liverpool, Eng., Aug. 3:—At Manchester, Liverpool, Cardiff, and Hull, the movements of stocks of timber and of quantities coming to hand by ship, have been much interfered with by a succession of strikes of dock-laborers and seamen. The interference was felt most at Manchester, where a general stoppage of discharging and delivery was caused, and continued for some days. At Liverpool the "hold-up" was less complete, and of short duration. At Cardiff and at points on the north-east coast, the interruption of trade was, for a few days, pretty general. The demands of the men have, in the main, been granted, but even with that, trade has not yet resumed its normally smooth course. The strikes have proved very costly to importers and merchants, as arrival parcels could not be moved for a time, and at some ports, deliveries could not be made as required. At Manchester, things are now normal again. There has been a better inquiry for timber, including some special inquiries from the Great Central Railway Company for walnut boards and pitchpine logs, and there have been inquiries for spruce deals. The building trade of the district shows signs of improving, and more inquiries for joiners' woods have been received.

At Hull, deliveries are now proceeding on a fairly satisfactory scale, and more timber is being sent inland by boat and railway. At Grimsby, since the labor trouble came to an end, stocks have moved rather briskly, and some are now much reduced.

At Liverpool, since the close of the strike, stocks of spruce have been handled freely, but otherwise business in timber continues quiet at this port.

The Terms of Credit Question

At the special meeting of members of the timber trade held at the offices of the Timber Trade, Fredericton, on July 12, the whole of the resolutions which had been framed by the special committee and which were recommended for acceptance by the meeting of the trade, were agreed to, with the addition of a clause to the main resolution, which was proposed by Mr. H. E. Nutman. The resolution accordingly became:—"That the terms of credit shall be uniformly fixed as follows:— (a) Cash less 2½ per cent. on or before end of month following delivery, or (b) acceptance at four months in lieu of six as at present prevailing, and that upon credit be also uniformly reduced to four months, beyond which, interest be insisted upon." It was left to the sub-committee to give effect to the resolutions and to call a further general meeting of the trade to deal with any point which might arise, if necessary. In the course of the proceedings at the meeting, Mr. G. H. Lindsey Reuton, who presided, spoke of the tendency with some traders to pay cash after taking 3 or 4 months' credit and then to demand 2½ per cent. discount. He characterised this as the great trade canker. It was, he said, obviously, a greater evil than allowing the general run of the trade, six months.

The provisions of the resolutions, if carried out, will improve matters for the trade. Those who may have slipped unconsciously, as it were, into the objectionable practice of dealing with accounts as complained of, will no doubt, brace up, and pay within a month. The others who have not in the past paid any sooner than they felt obliged to, will have to mend their method, or to look out for a new source of timber supply, as the sense and feeling of the trade will be against them.

Timber for Garden Cities

The most notable development which has taken place in the building trade in England, of late years, other perhaps, than the use of steel and ferro-concrete for heavy, constructional work, has been the adoption of what is known as the Garden City idea, and the carrying the idea into practice, as regards taking the earlier steps towards realization. The idea of the garden city, is that of a city planned on rural or sylvan lines, and enjoying practically perfect sanitary and hygenic conditions. The city must have wide and pleasant avenues fringed and shaded with trees. The houses must be of a picturesque, rural kind, with as much variety about them, in design, as possible. There must be plenty of garden space, back and front. There must be porticoes, halls, screens, seats, gates and railed work of a dainty and picturesque kind, the idea being to blend the best of the rural and the best of the new, hygienic, to form a kind of improved and up-to-date Hygeia, in which people who work in crowded cities may live happily and healthily. A good deal has been done towards carrying out this idea. Towns have been built in accordance with it, notably, Port Sunlight, Letchworth, and Bowneville. At London, a big development along the garden city line has lately been carried out, and is still being carried out in the suburban areas at the north and south of London. A few days ago I inspected one of the garden city areas to the north of London, and noted the extent to which the building of property of the kind was making a demand for timber.

The houses in the area which I viewed had made a relatively large demand for it. More timber appeared to have been used in finishing them than would be found in older houses of equal rent, or having an equal number of rooms. This was due to a very free use of red or yellow pine for cupboards, closets, shelves, and other wood fittings inside, and to the use of wood for an ornamental treatment outside, which is not met with in the older houses.

The frames of the front windows of the new houses show great variety, and have taken more wood than windows of the ordinary English "bow" type. They are much wider and have more mullions, and though the short and light bars of the older types of sashes have been done away with, heavier main cross rails have frequently been used, so that more wood has been used in the frames of these newer windows than those of the older "bow" windows or French windows. The window frames of the new garden city houses are of yellow or red pine, mainly yellow. A portico of some pattern, with scheme of light decoration wood work has been provided for most of the new houses. This has entailed the use of a few lengths of spruce to carry the "overhang," a main piece or two of 3 in. x 3 in. x 2 in. being used. Then there is a side support; perhaps two pillars at each side; which may be left square and about 4 in. x 4 in. or 5 in. x 5 in.; or may be part turned or shaped to some design. Light, cross rails are used in many cases, though one sees but little of the old trellis style of work. Generally, there is an ornamental facing worked of light rib-wood 1 in. or 1¼ in. wide x 1 in., with a suggestion of a plain gothic or moorish arch, overhead; the spaces between the rails which form the design, being lightly filled in with short rails, about 1¼ in. wide and 1 in. thick, or by "sweeps" or shaped pieces to give the open-railed or "fretted" aspect. Yellow or red pine, chiefly, has been used for this ornamental door work, and has made a considerable demand for the wood. Inside the main front door is either a glass paneled "hall" door, or as a substitute, a fretted arch, made of light rails or shaped pieces, about 1⅛ in. x 1 in.; which serves as a partial screen for what is beyond. A "hall seat" will have been fitted and will have required a short length of 11 in. or 12 in. pine, with possibly a couple of short upright pieces, as supports. Inside more joinery than in older houses of about equal rent and size. One finds lengths of paneled framing while stairs and balustrades have required more wood. Every room is provided with picture rails and the principal rooms with over mantels. The doors are of a new pattern, frequently having three long narrow panels, and a cross panel above them. Rails and stiles are rather massive. Any recess which could be so used, has been fitted as a cupboard, with doors and shelves. The aims in planning the new garden city houses have been to keep to two storeys only; the ground floor and one upper storey; and to give the highest degree of convenience, as regards fittings. This has entailed a relatively large use of wood, chiefly yellow or red pine, for the joinery work. Much property of the kind described has been built round London and Liverpool, but the realization of the garden city idea is far from being attained yet. Most of the larger towns will want their garden city suburbs, so that a considerable demand for timber is sure to arise on this account.

Telephones for Forest Protection

The Bay Shore Lumber Company, an American concern, which owns a very valuable lumber property and mills in St. John county, N. B., on the shore of the bay, has set an example in the matter of forest protection which ought to be of value, in view of the damage that has been done to a number of valuable properties in New Brunswick and Nova Scotia by forest fires this year. The Bay Shore Lumber Company have fire rangers on their property all summer, and have a telephone system, which they are extending, and which is of great value. For example, a fire recently

The Penatang Shoepack
Acknowledged the Leader by Lumbermen from Coast to Coast

For 41 years we have been manufacturing shoepacks, and have filled orders from China, Mexico, England and other countries, as well as from firms all over Canada.

Nothing but the very best material and workmanship put into every pack that goes out from the factory.

All stock made with lap over seam at the vamp, this being a great improvement over ordinary closed seams—making it thoroughly watertight.

PENETANG - ONT.

broke out in a part of their property and was quickly discovered by their fire rangers. They not only fought the flames, but by telephone were able to summon twenty or more men, and after a hard night's work the fire was put out. But for the quick discovery and prompt action, a dangerous blaze would have resulted, as the weather was extremely hot and dry.

Mountain Manufacturers Not Selling U. S. Lumber

A Calgary despatch says that Mr. W. A. Ansite, secretary-treasurer of the Mountain Lumbermen's association, emphatically denies the story that the mountain mills of British Columbia are acting as middlemen between American lumber concerns and the dealers in the Canadian prairie country. Mr. Ansite said: "The statement that the mountain mills of British Columbia are selling American lumber to prairie dealers on the pretext that it is Canadian lumber, is absolutely untrue. The trade knows very well that there are numerous brokerage concerns handling Canadian and American lumber and that there are also many American salesmen canvassing in the Canadian northwest market, and it is likely that the lumber referred to in the article mentioned came through one of these sources. Nothing could be farther from the truth than to say that the British Columbia mills are selling American lumber. That the statement is totally wild and unfounded is shown by the fact that the total importations of American lumber into Calgary for the past year would not exceed 250 cars, the amount mentioned as having been seized in one shipment." Speaking of conditions in the lumber trade generally, Mr. Anstie said that the greatest anxiety of the British Columbia lumbermen at present was not American competition, but the necessity of the dealers getting their supply in before September 1, after which date the C. P. R. had advised them a shortage of cars was quite probable.

Cross-Ties Purchased in 1910

The Forestry Branch of the Department of the Interior has collected statistics with regard to the cross tie consumption in Canada for 1910.

There were 9,213,962 cross ties purchased in 1910 by the steam and electric roads of Canada at a cost of $3,535,228. This is a decrease of 35 per cent. from the number purchased in 1909. The average cost of these ties at the point of purchase was 38 cents per tie. Three kinds of wood, cedar, jack pine and hemlock furnished 77 per cent. of all the ties purchased. Cedar itself supplied 40 per cent. of the total consumption and its use is increasing yearly in proportion to other species. Oak, which makes an expensive tie, costing 74 cents each, was used principally by an United States company having mileage in Canada. Of the total number of ties purchased, 70 per cent. were hewn ties. The only important species which has a majority of sawn ties, was oak. Sawn ties cost on the average 36 cents per tie and hewn ties cost three cents more. The steam railways used 95 per cent. of all the ties and these ties cost them on an average of 38 cents. The electric railways used 302,540 ties—an increase of 183 per cent. over 1909. They paid for their ties 41 cents each. Although on the average they use smaller ties, this excess of 3 cents in the cost is due not only to the disadvantages incident to contracts for smaller quantities of materials but also to the fact that the electric roads are more likely to purchase ties at points where the price includes transportation charges.

Mining Timbers Used in Canada in 1910

Mines to the number of 136 use considerable quantities of timber annually in their operations. Statistics of the amount used have been collected by the Forestry Branch of the Department of the Interior. Round (unsawn) timber was used to the extent of 52,848,000 lineal feet and cost an average of $9.90 per thousand. 22,305,000 board feet of sawn lumber and timber were used worth $13.63 per thousand. The total quantity of timber used cost $827,337. The round timbers varied in diameter from three to thirty-six inches and were used mostly underground as mine supports to give artificial support for insecure roofs and walls and to protect shafts, drifts and gangways. Ordinary lumber constituted most of the sawn timber and was used above ground for buildings, breakers, tripples, washers and trestles. Below ground the sawn timber enters into the ventilator shafts and sets. 13 different species of wood which are abundant, cheap and easily obtained from nearby localities. Thus, in each province certain species were used to the exclusion of all others. British Columbia used all the fir; Nova Scotia used all the spruce, balsam and hemlock; Alberta used all the jack-pine, larch and poplar. These three provinces contain the principal coal mines and consume over 95 per cent. of Canadian timbers. The ore mines of Ontario, although many in number, used only one per cent. of the total. These mines are small, shallow and in the solid rock so that little timber was required for supports.

Belt Blunders

How to avoid them:

Consult belt specialists before purchasing.

After thirty years of experience and tests we are recognized as BELT EXPERTS. We may know something that will mean ECONOMY to you.

As silk is worth more than wool per yard and wool worth more than cotton, so one belt is worth more than another by the same quality token.

AMPHIBIA BELTS

ARE DIFFERENT

from just "ordinary" belts; they are made to give service under all adverse conditions.

There is an AMPHIBIA BELT for every purpose.

For instance: AMPHIBIA Planer, for planing machines where wet or green lumber is worked, has proven a wonder.

Cost reduction must have your attention.

The belting that carries the power to your saws and woodworking machines should be considered most carefully. We can help you in cost reduction by giving you more power.

AMPHIBIA BELTS are sent to any reliable concern to prove their efficiency. If they fail to do as we say they can be returned with no cost to you.

If you make known your wants we will give you the benefit of our experience.

ONEIDA,

The Steel Pulley of better belt contact, lightness, maximum strength.

Oneida Steel Pulleys differ from any similar produce made. And in this difference lies their strength,

In construction the Oneida Steel Pulley is ideal. It is strongly reinforced, is lighter than any other steel pulley by ⅓ to ½ and possesses greater strength. The perfectly oval crown face insures a 20% better belt adhes on.

They are built in the greatest range of sizes of any steel pulley in the world, from 6 in. to 126 in. with 2 in. to 40 in. face with ¾ in. to 8½ in. bore.

EDGINGS

Ontario

Fire destroyed the planing mill of W. J .Travis at Wyoming, Ont., recently. The loss is partially covered by insurance.

J. A. Desrivieres, of Ottawa, lumber and sawmill operator, has changed the name of his company to J. A. Desrivieres & Company.

The Brown, Smith Turning Company, Broadbent, Ont., have rented premises formerly used as a planing mill on River street, Parry Sound, and are installing machinery.

The International Harvester Company will build a warehouse costing $100,000 at Fort William, Ont. H. J. Powers, Empire Hotel, Fort William, is supervisor of construction.

The Tudhope Company, Limited, Orillia, Ont., are preparing specifications for a factory to cost $200,000. Webb & Sons, Orillia, have the contract and the work is to commence at once.

The Allan Sawmill at Campbell's Bay, about thirty miles west of Ottawa, on the Ottawa river, was destroyed by fire recently. At one time the whole town was in jeopardy, but timely aid was sent from Bryson and the fire was kept under control.

The Northern Ontario Lumber and Milling Company, Limited, was recently put up for sale by the liquidators, the London and Western Trust Company, Limited, London, Ont. The result of the tenders submitted has not yet been made public.

The St. Lawrence Pulp and Paper Company, Ottawa, was recently damaged by fire to the extent of between $20,000 and $25,000. Two hundred and fifty tons of finished paper was almost completely destroyed and the machinery greatly damaged.

A big raft of pulpwood from Northern Ontario was towed into Ashland a few weeks ago, being the second of the kind, and the forerunner, it is believed, of a considerable importation of Canadian pulpwood. The last consignment was shipped by the Pigeon River Lumber Company to the Wisconsin Pulpwood Company.

The Chandler-Jones Lumber Company, who last winter purchased the mill and limits of Isaac Allan, located at Snow Road, Ont., on the Mississippi River and Kingston & Pembroke Railway, have made extensive improvements to the mill and yard, and are now ready for business. They report trade conditions as encouraging.

The International Land and Lumber Company, Limited, of Ottawa, which is being organized, is to have a capital of $2,000,000. They report that all the necessary capital has already been subscribed. The charter secured from the Ontario Government gives the company power to deal in timber or pulp wood limits and also to manufacture lumber products. The company also propose to deal in western land and to enter the real estate business in several Canadian cities. A pulp wood limit of about 300 square miles has been secured on the Salmon River in the Lake St. John district, which the cruisers report to contain an excellent growth of spruce. The President of the company is Mr. J. L. Bates of Ottawa and the Vive-president, Mr. R. N. Bates.

Eastern Canada

Joseph Isabelle, of Armanagh, Que., lumber dealer, is reported to have assigned.

The New Brunswick Gazette contains notice of the assignment of C. R. Burns, lumberman, of Fredericton, N.B.

The lumber, sash and door factory of Walter Reed, Montreal, was damaged by fire recently. The loss was covered by insurance.

The woodworking factory and property of A. E. Hamilton, Limited, St. John, N.B., has been sold to Christie Woodworking Company, Limited.

Edward McElveny, lumberman of Fredericton, N. B., has made an assignment for the benefit of his creditors, to W. T. Howe, sheriff of the County of York.

Messrs. McLean and Sladig's sawmill at Connor's, N.B., was burned to the ground recently. It has been running all summer. The insurance amounted to $4,000.

The sawmill of Thomas McDougall at Granby, Que., was entirely destroyed by fire recently. The mill was valued at $4,000 and the insurance is reported to have amounted only to $800. It is likely that the mill will be rebuilt.

Tenders for supplying ties and switch ties for the Intercolonial Railway will be received by Mr. Louis Lavoie, purchasing agent, Ottawa, until August 31st. Specifications, etc., are to be seen at the stations of the I. C. R. .

The planing mill and sash and door factory of J. A. Brien and Company, Craig and Delorimer avenue, Montreal, was destroyed by fire on August 7th. The loss amounted to about $35,000. The sash and door factory of Messrs. Fevreau and Corveau in the rear was damaged to the extent of $15,000.

The woodworking factory and sawmill plant of J. D. & P. A. MacGregor, Limited, on Barney's River, New Glasgow, N.S., is offered for sale. The plant is well equipped, is located on the line of the Intercolonial Railway, with siding and good water power, and includes a farm of 150 acres, a house, mill, dam, etc., and about 1,200 acres of woodland suitable for supplying material for the manufacture of furniture or for manufacturing hardwoods. The limits contain a good quantity of birch, maple and beech.

Western Canada

The Roblin Lumber Company, Roblin, Man., are negotiating for the sale of their business.

The Western Canada Sawmills Yards, Limited, of Saskatoon, Sask., are opening a branch at Young, Sask.

The Westholme Lumber Company of Victoria, B. C., will build two new business blocks on Second street between fifth and sixth streets.

F. L. Engman, Port Hammond, B.C., lumberman, is reported to have assigned to the Westminster Trust and Safe Deposit Company, Limited.

A British syndicate, represented by J. E. Porter, of London, has taken over 20,000 acres of timber near Alberni, west coast of Vancouver Island.

Three million feet of logs were burned at the lumber camp of the Fernie Lumber Company on July 30. All the camp supplies and buildings were destroyed.

The National Timber Company, Limited has been incorporated in British Columbia with head office at Vancouver. The capital of the company is $250,000.

The Powell River Company, Limited, has been incorporated with capital of $4,000,000, and head office at Vancouver. The purposes of the company are to manufacture pulp, paper and lumber.

The McLelan Lumber Company, 744 Hastings street west, Vancouver, B. C., have commenced the erection of a temporary mill to saw lumber for their new plant. The new plant is to be run by compressed air.

The Canadian Timber Investment Company, Limited, Royal Bank Chambers, Vancouver, B.C., has been incorporated, with a capital of $400,000, to carry on business as lumber and timber merchants, saw and shingle mill owners, etc.

The American Woodworking Machinery Company, Fourth avenue and Granville street, Vancouver, has been incorporated, with capital of $1,500,000. R. G. Glanville, secretary of the Hanbury Lumber Company, is attorney for the company.

The Morrison Mill Company, of Bellingham and Blaine, Wash., has bought the plant of the British Columbia Manufacturing Company at New Westminster, and will engage in box making. It has begun the manufacture of box shooks, a new industry for British Columbia.

The British Canadian Lumber Company, 1605 Georgia street, Vancouver, B.C., are erecting a $400,000 mill on Lulu Island. The architect is A. B. Pracna, 821 Pender street west, Vancouver. The company will take a separate contract on the machinery. The estimated output of the mill is 250,000 feet.

The Campbell Lumber Company has secured 6,400 acres of white pine near Kitchener, B.C., and will overhaul the old mill there for operation. An aerial tramway for carrying logs will be installed. R. Campbell, of Moyie, is president of the company, with him A. C. Creeman, Calgary, and J. T. Burgess, Kitchener.

The Newport Timber Company, logging in the Squamish Valley, B.C., lost heavily by a recent forest fire. Its camps were nearly wiped out of existence. The stables were burned, the biggest loss being in the destruction of timber cut and ready to haul away. The damage in the valley altogether will total $500,000.

Fire did about $10,000 damage to the Alberta Lumber Company's stock and buildings at Vancouver recently. The fire started in a sawdust pile and spread quickly, damaging the boiler house and destroying a large quantity of lumber, estimated at 400,000 feet. The firemen prevented it from damaging any of the other buildings. There is a partial insurance.

Fire entirely destroyed the plant and stock of the Taylor Mills & Lumber Company on Government street, Victoria, on July 30th. The total loss is estimated at $100,000. A million and a half feet of lumber was stored in the yards and closely situated piles were eaten up with incredible rapidity. The plant was owned by Seattle capitalists and it is reported that it was only insured for $22,000.

Rafting work was resumed by the St. John River Log Driving Company on August 7th after a let-up of a few weeks. There was then about four or five million feet of logs in the lower boom. On account of the extremely warm weather the water in the river dropped rapidly and work was delayed very much on that account. Under present conditions the work is going along slowly.

The mill of the Jervis Inlet Lumber Company, at Ladner, B.C., at the mouth of the Fraser river, which was burned down a year ago, is to be rebuilt by the McLellan Lumber Company, of Vancouver, which has purchased the site. This company has also taken over the timber and camps of Ben Roberts & Company, New Westminster. A box factory and sash and door factory will also be built.

A new mill, to be located probably on the mainland, is to be erected by the Canadian-Puget Sound Lumber Company, which has its head offices in Victoria. This is the name of the amalgamated Michigan Pacific and Michigan Puget Sound Lumber Companies, which had their headquarters in Grand Rapids. Besides the new mill, $750,000 is to be expended in improvements to present buildings and plant.

J. S. Emerson, of Vancouver, B.C., president of the Emerson Lumber Company, and also president of the South Pacific Lumber Company, a corporation which controls a very large tract of hardwood timber in the Fiji Islands, with its sawmill and headquarters at Suva, has purchased the plant of the Pacific Lumbering & Manufacturing Company, of Portland, Ore. The new company, in addition to manufacturing Japanese oak, will manufacture the product of their own Fiji forests into lumber and veneers for furniture, chairs, interior finish and cabinet factories, to which its character, both in color and texture, is splendidly adapted. It is the intention of Mr. Emerson to utilize the present site for a time and later to secure a more available site and build a plant commensurate with the needs of the business. A fleet of sailing vessels will be employed to convey the logs from Suva to Portland and carry back the products of the Pacific Coast to Fiji.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

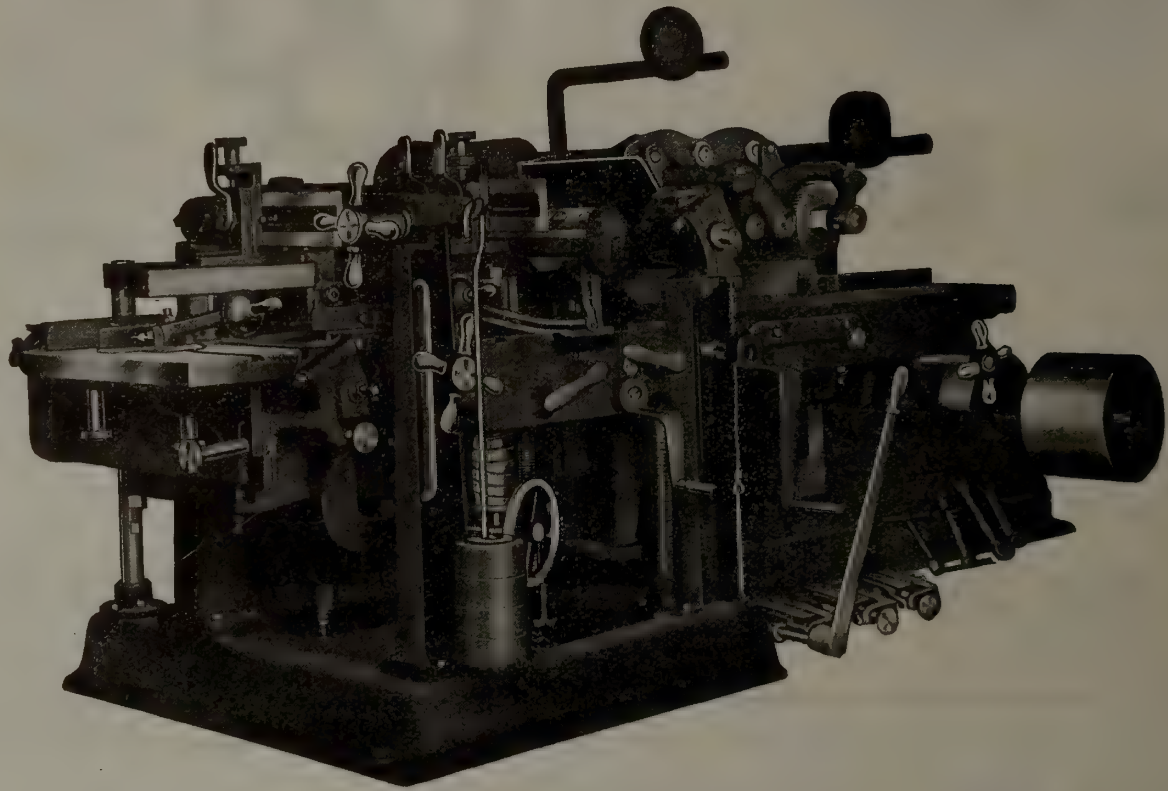
Canada Machinery Corporation

Limited



No. 303 Heavy Duty Moulder

ON BASE

THIS is without a doubt one of the heaviest and most substantial machines on the market to-day. Everything that is necessary for strength and hard continuous work is included in this machine, and all useless trappings are dispensed with.

OVER twenty mill men have ordered the No. 303 during the past few weeks. WHY? Because it delivers the goods. It earned its reputation for being the most satisfactory moulder ever offered for general work. It has only one peer. Our No. 300 inside moulder.

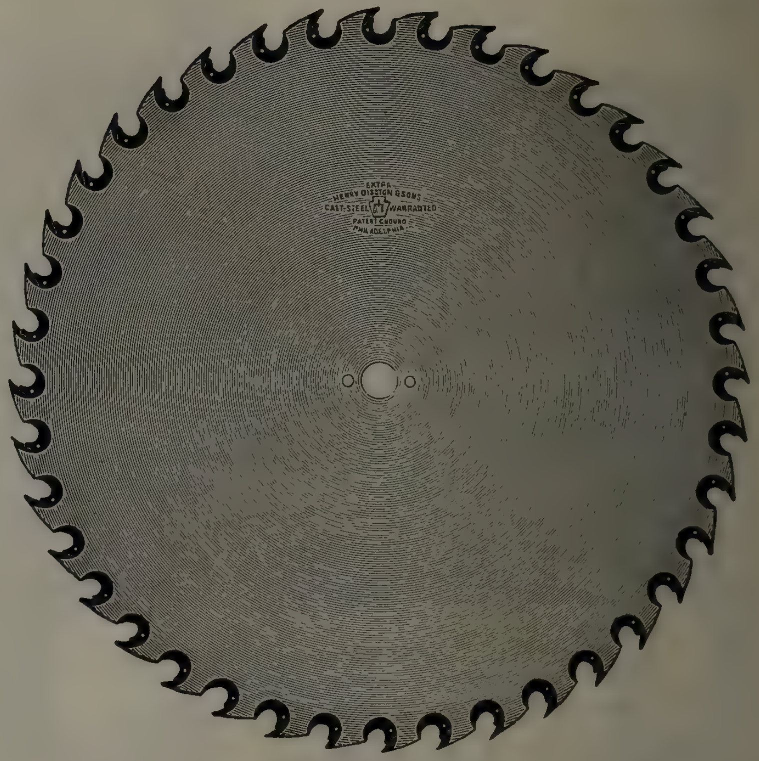
GREENING

Disston

Saws Tools Files



The tool that is "cheapest in the end" is usually the one that is a little more expensive "in the beginning."

The initial cost of Disston Saws, Tools and Files may be slightly higher than that of the ordinary kind, but Disston lasts longer and is more easily kept in condition, permits faster, more efficient work, and after all, is more economical.

Disston Crucible Steel is exceptionally adapted to making high grade Saws, Tools and Files. Its uniformity and durability, in conjunction with expert shop treatments, have made Disston Tools the best on the market.

Many of the most widely favored types of saws, tools and files have been designed and invented in the Disston works. Disston improvements and innovations have always set the pace, have always led the industry.

What's Your TROUBLE?

Do you have trouble from the operation of any of the pulleys in your mill? We have found that nearly every mill has one or more troublesome pulleys, and we are looking for just this kind of "tough transmission propositions." Sometimes the difficulty is from one cause and sometimes from another. In the instance below, we overcame two troubles. Read what this gentleman says about how we made good.

November 18, 1910.

The Positive Clutch & Pulley Works,
Limited, Toronto, Ont.

Gentlemen:—

We have one of your pulleys, 40 x 10, transmitting 60 h.p. as our main drive since last July. We have never had to tighten same since first installed, and are pleased with the noticeable absence of windage from the arms. The above conditions have always been our principal objections in connection with wood pulleys. We formerly had a wood pulley on this particular drive and were obliged to shut down every other day to tighten it on the shaft. We finally had to key the pulley to the shaft and the key soon split the hub. We believe that you have a very superior pulley and we wish your company every success.

Yours very truly,
(Name furnished on request).

Let's analyze and see why the "Positive" Split Pulley is successful. The pressed steel arms, while giving maximum strength, are very small. Thus, the wind resistance, or windage, is the very lowest. Did you ever push a bicycle against a head wind? Takes muscle, doesn't it? Each pulley with wide arms wastes from $10.00 to $20.00 of your horse-power per year. Again, the "Positive" malleable hub with its interchangeable cast iron bushings grips the shaft like a vise. You can tighten it as tight as you like; the hub won't split, and it stays tight. "Positive" Pulleys make good where others fail; they cure transmission troubles. It's likely we've cured a case similar to yours. What's your case

OILDAG

(REGISTERED TRADE MARK)

Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E. E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

" As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super heated steam practice. "

View of Fay & Egan Patented
KNIFE EDGE STRAINING DEVICE
Made like a Scale Balance.

The VITAL POINT

UPON the arrangement for straining the blade hinges the success or failure of a Band Saw.

That the FAY & EGAN Patented Knife Edge Straining Device (constructed on the principle of a scale balance) is the most positive—most sensative, is proved by the numerous attempts to immitate it without infringing the patent of February 27, 1900.

The basic features of this patent can not be copied, and therein lies the failure of all other so-called Knife Edge Strains.

The use of the Knife Edge Strain together with the solid lower and light upper wheel on the No. 180 Auto. Band Rip Saw shown herewith permits the use of the thinnest blades at a speed twice that of the ordinary Band Saw with absolutely no danger of cracking the Blade.

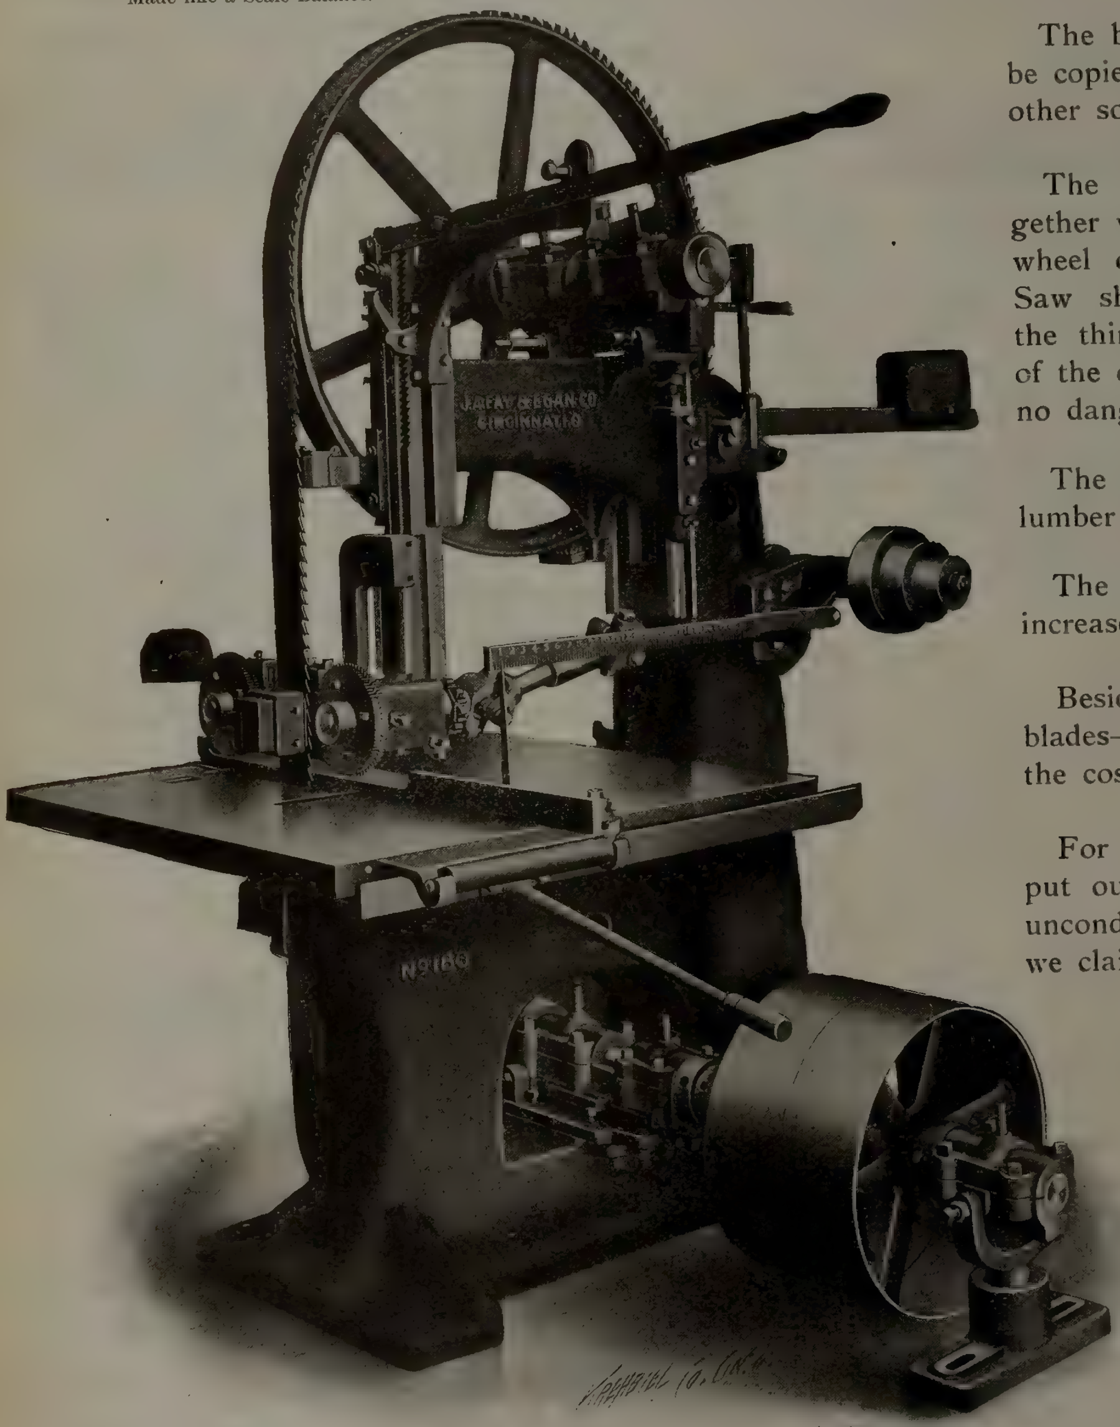
The thin blade means you will get more lumber and less sawdust.

The double speed means a proportionate increase in the number of feet cut per day.

Besides—you save the cost of broken blades—the loss of time in changing and the cost of constant repairs.

For a general purpose Rip Saw we will put our No. 180 into your plant under an unconditional guarantee to make good all we claim.

Your own interests demand an investigation of Fay & Egan Band Saws, the most complete line made. The way to start is to write for our catalog or special booklet, "The Care of Band Saws."



NO. 180 AUTOMATIC BAND RIP SAW Patented Feb. 27, 1900—Oct. 2, 1900.

LOGGING AND INDUSTRIAL LOCOMOTIVES

The knowledge and experience gained in building locomotives of all types, capacities and sizes for every kind of hauling is applied to every locomotive we build, and is available to you.

Our small locomotives for logging, and light switching service are not merely selected from designs previously built, but are special designs to meet special requirements.

They are designed and built with the same care required for 200 ton locomotives. Only the best materials are used in their construction, and every part is made to jigs or templates, guaranteeing that repair parts will fit.

They are constructed with a view to the fact that they must sometimes be operated a considerable distance from shop facilities, therefore simplicity and sturdy construction are vitally necessary.

Fuel cost is always important. This is considered in the design and capacity of the boiler, and in the design throughout.

Write us concerning your requirements or ask for a consultation with our engineers.

We are in position to meet every requirement in locomotives and to supply repair parts at short notice from our Works at Longue Pointe, Montreal, Canada.

Dry Lumber

***Like** you want it ~ **When** you want it ~*

Read This Letter

Woodstock, Ont., Nov. 10, 1910

Grand Rapids Veneer Works,
Grand Rapids, Mich.

Gentlemen :—

In reply to yours of the 2nd inst. would say that your Dry Kiln System has been very satisfactory to us. We have had no difficulty in drying perfectly any kind of material we use except rims. It will dry the material all right but the steam straightens them out. It is the only system in our experience that will dry gum box boards without warping. When we put in additional kilns it certainly will be your system.

Yours truly,
THE BAIN WAGON CO. LIMITED
(Signed) John A. Bain,
Vice-Prest. & Mngr.

We have letters from many more Canadian Factories and Mills which we will send you on request. They will tell you how to

Dry Lumber

Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.

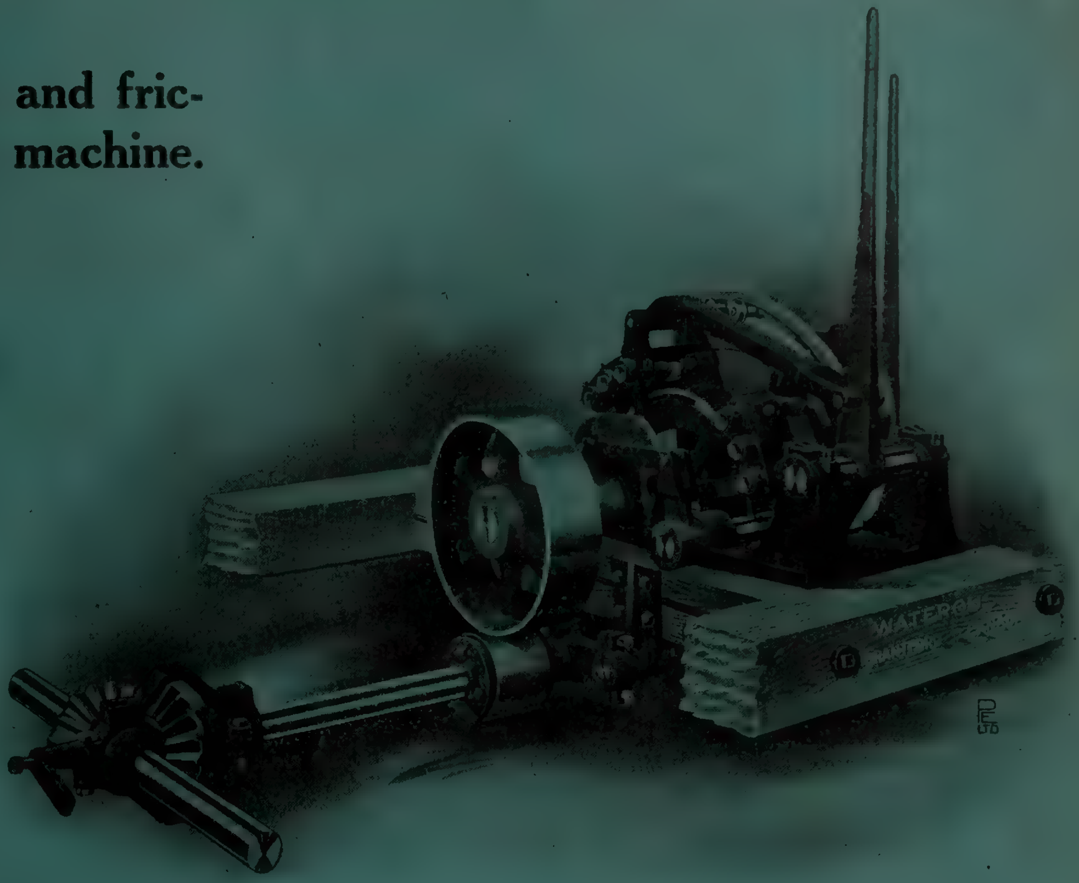
The Waterous Combination Setworks

A setting mechanism and friction receder in one machine. Quick, powerful, safe and absolutely accurate. Can be attached to any rack carriage having set shaft not larger than 2-$\frac{15}{16}''$. Easy on the carriage, easy on the operator and easy on itself.



This Setworks cannot Develop Lost Motion

In the ordinary Setworks the setting lever movement that determines the amount of set is controlled by stop pins placed in a stationary quandrant. As soon as the connections between the lever and the pawl cages become worn, lost motion is bound to develop, and the accuracy of the set is lost.

We overcome this in our Setworks.

The quandrant carrying the stop pins is fastened to one of the pawl cages—on the movement of the setting lever the cages start from the home stop, advance until they strike and then return to the home stop. For the same position on the stop pins the travel of the cages will be the same, no matter how much the connecting links are worn. All wear comes behind the pins and *the absolute accuracy of the set is a permanent feature.*

Other Features

1.—**The friction receder lever** lifts the pawl automatically from the ratchet wheel before receding can commence. This does away with a pawl lifting lever.

2.—**Only two levers are required** for both operations of setting and receding, both are placed most conveniently for the setter, no stooping is necessary. The operator can thus work quickly, accurately and without fear of stripping his ratchet wheel.

3.—**Tool steel pawls** extend full across the 4″ face of wheel, three pawls are carried in each cage, the latter made very wide and open for quick adjustment and to prevent clogging by saw-dust.

4.—**Quandrant is double slotted,** carries our patented knockback pins, arranged to give four standard cuts without shifting.

5.—**Pawls** are arranged to set by 1/32″ up to 3″ at one full throw of lever.

6.—**Every part is made to template,** repairs can be quickly furnished. The setworks can be supplied without receder attachment if desired.

Let us send you our new Carriage catalogue containing full description of this Setworks. Bulletin No. 107.

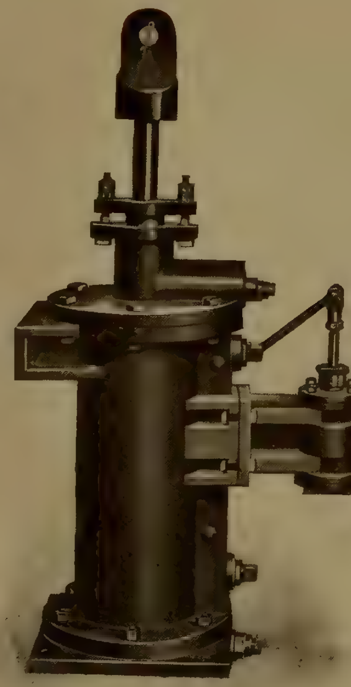
Log Handling Machinery



The cut shows the type of cylinder we have been putting on all our kickers, loaders and canters for over four years. In that time it has been thoroughly tested in many mills and its value has been thoroughly proven.

Notice that all piping between valve and cylinder has been done away with.

Notice also the check valves in head and base of cylinder. These valves cause the steam to cushion in the cylinder at each end of the stroke, thus preventing the piston or the top or bottom head being broken.

The
Grand Triumph
Shingle Machine

is probably the best known horizontal shingle machine made in Canada.

We are the original manufacturers of this machine in Canada and the only manufacturers in this country making the genuine Grand Triumph machine.

It will cut upwards of thirty thousand shingles in ten hours, and it requires for its greatest capacity only ten horse power to run it.

It cuts all of the bolt into shingles—no waste at the end. Send for our catalogue.

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

Get Busy, Mr. Dealer

Don't sit with your hands folded while your competitor down the street is moving his stock out quickly.

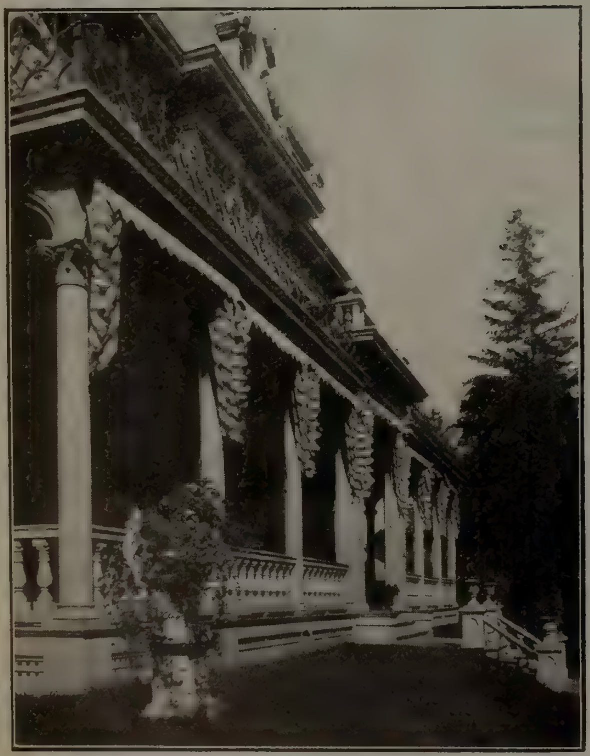
Handle a line of lumber that sells well, prevents complaints, is up to grade and always satisfies your customers.

We aim to produce the highest quality of lumber at the lowest possible cost. Our workmen are skilled, are under our personal supervision, and, as a result, every stick of lumber turned out is strictly up to grade and produced at a minimum cost.

Dealers who handle our lumber always come back for more. Have you tried a car yet? If not, get busy. Quick shipments our specialty.

The Hocken Lumber Co., Limited Otter Lake Station
Ontario

Manufacturers of Hemlock, Pine and Hardwood



Columns that last

These Verandah Columns—12 inches in diameter—built by us about 40 years ago, are still in perfect condition. The stair is also our product and is in the same house and in A 1 condition.

These illustrations may not represent our present styles but they do represent our thorough methods and good materials. It should help you to know that building materials purchased from us this year will be as perfect in 40 years.

Send for our literature or any information you wish.

M. Brennen Sons Mfg. Co., Limited

HAMILTON, ONTARIO

"Red Deer"

Hardwood Flooring

Every dealer should carry this brand of hardwood flooring. "Red Deer" not only brings new business but it strengthens your present trade. All our flooring is kiln dried, properly side and end mached, bored, steel polished and bundled. The different grades of "Red Deer" are "Red," "White," "Clear," "No. 1" and "No. 2."

We also manufacture Hemlock, Bill Stuff, Spruce and Hardwood Lumber.

Pine Doors

Guaranteed in Material Manufacture and Price

Handled from the Forest to the Dealer by Us Exclusively

Mr. Lumber Dealer:

We have recently installed in our factory the latest machinery and facilities for the manufacture of

Pine Doors

of All Kinds

The very best material and the finest workmanship are being put in their manufacture.

We secure the logs in the forest, which are cut in our own Saw Mills, and we are therefore in a position to quote you the very lowest prices on Doors.

Special facilities for quick shipment. Drop us a line and give us an opportunity to back up our assertion.

The
Pembroke Lumber Co.
Pembroke, Ontario

Good Logs make Good Lumber

Besides supplying our customers with "A I" lumber, we are able to ship promptly. Our mills and shipping facilities are unequalled in Canada. We have a complete stock of rough and dressed Hemlock, Spruce, Pine and Hardwood.

A Skid containing about four million feet of logs

Even if your present millman is supplying you with "good stuff" give us a trial — we may be better. Remember we have high-grade stocks, lowest market prices and we ship when we say we will.

Sept. 1, 1911

Gentlemen: —

We are in a position to furnish your requirements in SOUND, WORMY and COMMON and BETTER CHESTNUT, Oak, Poplar and all WEST VIRGINIA HARDWOODS.

We have an established trade with a large number of the leading Furniture, Piano, and Casket concerns in Michigan, Indiana, Illinois, Wisconsin, and Ohio, who can vouch for the uniformity of our grades, promptness of our shipments and ability to take care of their wants.

We would be much pleased to hear from responsible concerns who are looking for a connection in WEST VIRGINIA and if you will be good enough to send us a list of your requirements and state what you are in position to contract for at the present time, we will be glad to quote you our lowest delivered prices or call and see you personally.

Yours very truly,

MIDLAND LUMBER COMPANY.

The Enviable Reputation earned by

STILL'S AXE HANDLES

Has been built up chiefly by attention to two details:

1. Care in the selection and seasoning of the wood.
2. Skill in the shaping and balancing of the handle.

As a genuine satisfaction-giving line, Still's Handles have no superior and very few equals. The prices will interest you.

HAGGARD & MARCUSSON CO. Manufacturers

115 WEST 37th STREET, CHICAGO, U. S. A.

Rubber Belting

for Power Transmission and Conveying

Good Rubber Belting is not injuriously affected by heat, cold or moisture; is perfectly uniform in width and thickness; is very strong; is smooth and adheres closely to the pulleys, thus insuring maximum power transmission.

BOSTON BELTING CO.

Duck especially woven to insure greatest strength and least possible stretch; good rubber to hold the several plies securely together, and a high grade rubber cover all combined in the best possible manner, make our rubber belting pre-eminent for excellence and satisfaction-giving qualities.

"Imperial" Stitched Rubber Belting has long been well-known for its superior merit. The rows of stitches add materially to the strength of the belt, and it is often possible to use an **"Imperial"** stitched belt with one ply less than would be required in a regular rubber belt.

"Universal" Fine Duck, Friction Surface Belting is especially adapted for use on woodworking machinery, where the pulleys are small and the belt speed high. It has proved its merit by good work in many places.

We also manufacture a great variety of rubber **Packings**—including sheet, piston and pump packings—**Hose** of all kinds and for all purposes—**Valves, Gaskets, Springs, Tubing, Mats and Matting.**

BOSTON BELTING COMPANY Established 1828 TRADE MARK BOSTON NEW YORK

The quality of **BOSTON BELTING CO.** products is well known, and mechanical rubber goods bearing our Trade Mark are in daily use throughout the entire country. If you specify **"Made by Boston Belting Co."** when ordering mechanical rubber goods, you will assure to yourself material that is

"Superior in Quality—Satisfactory in Service."

We solicit your inquiries and orders—

Band Saws, Saw Tables, Swing Saws

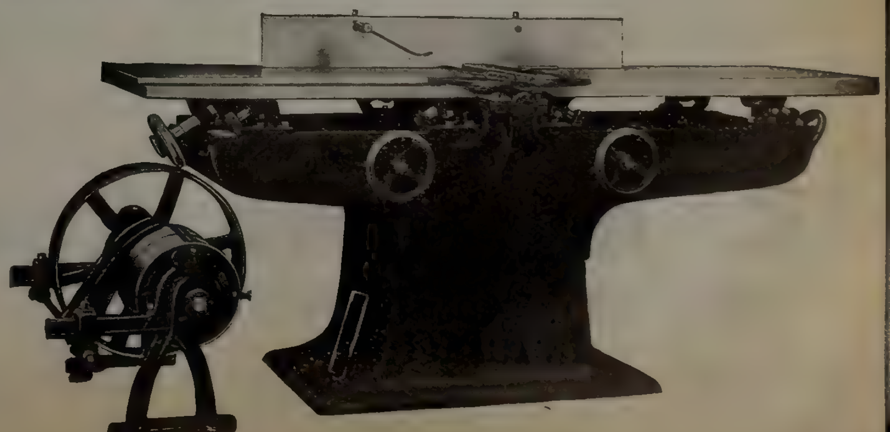
Thousands of Silver's Machines are earning big money in all parts of the world. Australia, New Zealand, South Africa and India are heavy buyers.

Silver's machines are designed for convenience and ease of operation and for rapid efficient service. Their moderate price recommends them to all wood workers.

Strong, durable, high pressure machines that will save you time and labor. Made in sizes to suit any need or any purse.

Ask for 1911 Machinery Catalog and special Canadian prices.

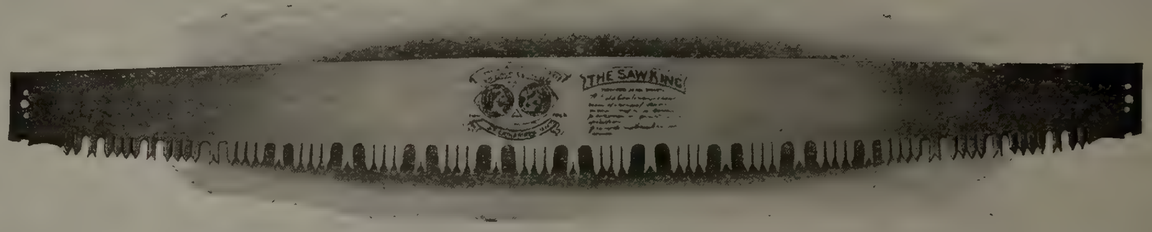
THE SILVER MFG. CO.,
375 BROADWAY **SALEM, OHIO**



A Hard Pair to Beat

Two Saws that have proved great favorites in the lumber camps on account of their unquestionable superiority

THE "SAW KING" CROSS-CUT

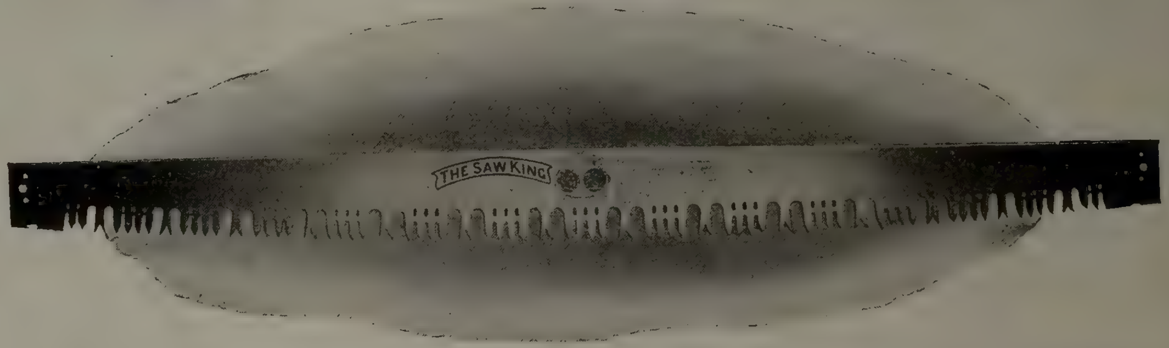


Please note the shape of the **Rakers or Drag Teeth,** and the **Gullets.** The drag teeth are so constructed that they curl the sawdust into gullets, and the gullets, by slanting from the rakers, throw the sawdust out more freely and keep the cut perfectly clear from sawdust.

This style of saw is specially adapted for British Columbia trade as there are no braces between the cutting teeth as shown in the illustration of the Narrow Saw King. We make both THE SAW KING and THE NARROW SAW KING in both patterns with and without the brakes.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention

THE NARROW "SAW KING" CROSS-CUT



The Narrow Saw King Crosscut Saw is specially adapted for small timber or a falling saw, and has the advantages of both a wide or hollow back Crosscut Saw.

The Narrow Saw King is a straight back saw, being bevel ground four gauges from the teeth to the back, making the saw thirteen gauge at the teeth, seventeen gauge at the back, and is only one-quarter inch wider than a Hollow Back Saw.

Please note the shape of the **Rakers or Drag Teeth,** and the **Gullets.** The drag teeth are so constructed that they curl the sawdust into the gullets, and the gullets, by slanting from the rakers, throw the sawdust out more freely and keep the cut perfectly clear from sawdust.

The Saw King Crosscut Saws have merits possessed by no other saws. By looking at the above cuts you will see that the chip spaces are wider and deeper in the centre than they are in any other part of the saw, thereby giving a capacity for the accommodation of the largest accumulation of sawdust, which is always in the centre of the saw. The chip spaces decrease in size from this point of the saw, as also does the quantity of sawdust. All users of saws know that the teeth at the centre wear much faster than they do at the ends, as the teeth are longest at the centre, it gives greater wearing capacity to the saw, and as the teeth are smaller at the ends of the saw and leaves the saw blades wider between the teeth and at the back. Where the blade is narrowest, it gives more strength and stiffness at the point where it is most required. The saws are tempered by our new improved process, giving them a keener cutting edge than any other Crosscut Saw made. They are thoroughly warranted. Any defective saws will be replaced by the seller.

ANOTHER POPULAR "SAW KING"

The one man "SAW KING" Cross-Cut is a saw that is very popular with the Contractors, and others requiring a one-man saw. We have all lengths in stock for immediate delivery.

Let us know where we can send you our complete Saw Catalogue

R. H. Smith Company, Limited

Saw Manufacturers **St. Catharines, Ont.**

JOHNSTON RE-SAW is a Lumber Saver and a Money Maker

The advantages of this machine over all others are:—1st—As a lumber saver, using 10 and 12 gauge saws: 2nd—Can be set instantly to cut lumber from ½ inch to any thickness up to 4 inches: 3rd—Has screw adjustment so that thickness can be varied 1-12 of an inch under or over standard thickness: 4th—Automatic adjustment to prevent saw from burning by slivers catching: THE FRAME being heavy is very rigid, so that saws can be run at high speed without vibration: THREE POINT driven: Three return live Rolls 8 inch by 20 inch automatic feed: Two grooved Rolls 8 inch diameter; one 16 inch adjustable Roll grooved; all gear: Power required, 20 to 30 h.p.; Weight 6,500 pounds: Floor space 8 feet by 9 feet 3 in.

Sunday Creek Coal Co. buys Twenty-four McCaskeys

THE SUNDAY CREEK COAL COMPANY, of Columbus, Ohio, has just ordered eighteen more McCaskey Account Register Systems, after giving a most severe trial to six McCaskeys purchased some months ago and after an open competitive test in which other so-called "accounting systems" essayed to prove their superiority.

¶ In all, the Sunday Creek Coal Company has bought twenty-four McCaskey Systems for its twenty-four stores. No other method of handling accounts is used.

¶ The same reasons why The Sunday Creek Coal Company bought only

With Only One Writing. **The McCASKEY SYSTEM** The End of Drudgery.

should move you when you consider the installation of a one writing method of handling your accounts of goods, money, labor—anything. Whether you have one store or fifty, one hundred accounts or ten thousand, the McCaskey System will take care of every detail of your business just as it does for more than seventy thousand merchants in all lines of business in all parts of the country.

¶ This is what The McCaskey System will do for you :

- ¶ It will cut out your useless bookkeeping, copying and posting from one book to another, and from book to billhead and statement.
- ¶ It will prevent your forgetting to charge an account and in this way alone it will pay for itself several times in the first year it is in your store.
- ¶ It prevents errors and the disputes with customers that follow.
- ¶ It collects money faster than any human agency, because every sale slip is a reminder to the customer of the money due you.
- ¶ It automatically limits the credit of those you wish to set a credit limit on.
- ¶ It enables you to prove your loss to the penny if your store burns.

¶ The McCaskey System keeps every account posted and totaled to the minute. It ends all book work, night work, worry and trouble over accounts.

¶ The McCaskey System furnishes each customer with an itemized bill after each purchase and the total of his account to date—all footed up. The installation of the McCaskey System will speak more loudly for you to your trade than anything you can say or do, that you want your customers to ***"Always know what they owe."***

¶ Every day you delay in installing the McCaskey System means a loss of dollars and trade to you. Write today for free information. We'll be glad to send you testimonial letters from merchants you know, in your own province, county and city.

¶ It is cheaper to own a McCaskey than to do without one. ¶ Act now ; write before you forget.

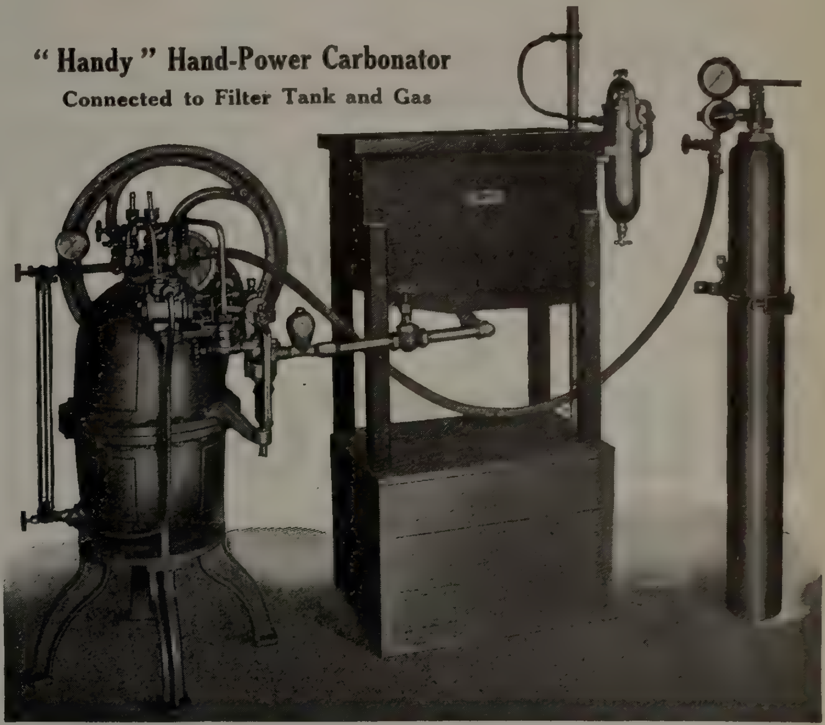
TAKE A SODA WATER BOTTLING PLANT TO CAMP WITH YOU



“Handy” Hand-Power Carbonator
Connected to Filter Tank and Gas

The man who does physical labor requires almost as much liquid nourishment in winter as he does in summer. He craves a cold drink no matter how low the temperature may be.

Ginger ale, root beer, birch beer, sarsaparilla, lemon soda, and plain carbonated water are all extremely wholesome and go a long way toward satisfying the craving for stronger beverages, keeping the men more fully satisfied and helping them to while away the long evenings.

The profit in bottling soda water is very large, even if you sell it to your men at 5 cents a bottle; and you have the advantage of being able to prevent the loss of your bottles and to fill and refill them innumerable times. It will not, therefore, be necessary for you to carry with you a very large supply of bottles.

The camp equipment would consist of the following:

- **“Liquid” Carbonator (electric if you have power, otherwise hand-driven)**
- **A hand-power bottle washing machine**
- **A small bottling table**
- **A small supply of bottles and cases**
- **A liberal supply of patent stoppers.**
- **A liberal supply of flavors**
- **A 50-pound cylinder of gas for every 600 dozen 8-oz. bottles of goods you will put up.**

Everything in this equipment is easily portable; the original expense is small; your selling price is at least four times your cost your camp cooks can do the bottling.

Carbonated beverages made from our pure extracts and flavors and our “Diamond” Pure Gas are extremely wholesome and beneficial, their systematic use doing much to prevent stomach troubles that come from the use of canned, frozen, and dried foods, and neutralizing to a large extent the vegetable impurities found in the drinking water.

These beverages are always delicious, and by bottling a variety of them you can keep the interest up throughout the long winter season.

You have everything to gain, financially, physically and morally, in adding to your camp equipment this novel and welcome innovation, and the fact that you are supplying this luxury to the men may be of great assistance to you in securing the quantity and quality of help you require for the winter's run.

Liquid branches at Minneapolis, Chicago, Pittsburg and New York, have charge of Canadian territory, and will be glad to take up the matter with you in detail. Address the **Liquid Carbonic Company's** nearest branch.

Canada Lumberman, September 1911.

Horses kept in a stable need something in addition to their regular feed.

Give them

Nutriotone

the True Tonic

It supplies the medicinal roots, herbs, barks and grasses which they would get on a natural pasture. Not a "Stock food"—highly concentrated, a little mixed with the feed goes a long way.

Aids Digestion
Prevents Colic
Expels Worms
Regulates and Cleanses
Saves 12.50 a year on every Horse

As **Nutriotone** aids digestion and assimilation, an average of 2 quarts of feed can be cut from each horse's ration and the animal

kept in better condition

Your dealer will get **Nutriotone** for you or we will ship it direct. We advise ordering 10 lbs. for each horse for a fair supply.

W. D. Carpenter Co.

Syracuse, New York

Favorite Shanty Range

is specially constructed for use in Lumber, Railroad and Mining Camps.

FAVORITE
SHANTY RANGE
10-25

This Range is substantially built of 14 and 16 gauge, specially prepared British Steel.

The top is large, the oven roomy and has the capacity to cook for fifty men.

The Fire Box is 31 inches long, being two inches longer than any other Shanty Range on the market. The Fire Door is unusually large to admit rough coarse wood.

Size of oven 25 x 27 x 16.

Capacity of Reservoir 15 Gallons. Coal Linings, Water front or Coil Water Back can be furnished with this Range when desired.

Camp Favorite

CAMP FAVORITE

This Stove is a powerful Heater. The body is made of extra heavy rolled steel in one sheet, rivetted and put together like a steam boiler. It is an absolutely safe Stove as there are no joints to get loose and leak ashes.

The adjustable shelves may be placed to give a level cooking top, or can be set down on the sides of the Stove to form foot rests.

Made in three sizes, 36, 42, 48 inches long.

Dimensions of Fire Door 13 x 15 inches.

Our prices are right and can make prompt shipment.

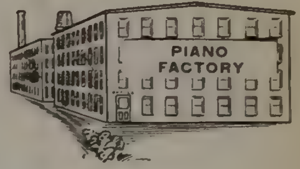
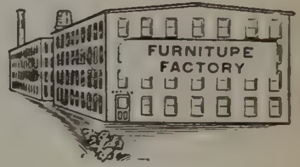
What I Learned on a Recent Trip

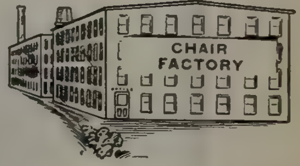


¶ A tour of investigation sometimes leads to many surprises.

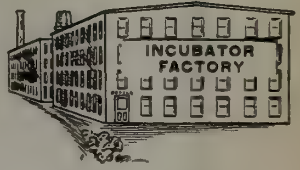
¶ The writer found that our field of usefulness could be largely increased.



¶ The *first* place I struck was a PIANO factory. Here our machine could make the round, square and octagon pilasters, trusses and handles at a saving of from 75% to 100%. Their hand turner produces 45 to 50 trusses daily—we showed them the way to make 700 in the same number of hours.



¶ From the piano to a FURNITURE factory was the next step. Hand turner and back knife lathes were in full swing. They make their ***square*** and ***octagon*** work by band saw and hand work, nor could they produce fine beaded patterns at reasonable cost. Here we showed them how to ***insure*** themselves against hand turners, reduce the cost of making different patterns and eliminate ***waste.***



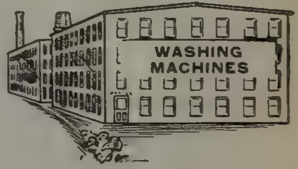
¶ Two days later, I visited a DINING ROOM TABLE plant where they make 16″ and 18″ pedestal's built of glued-up stock. They came in ***round, square*** and ***octagon*** designs and had to be turned by hand or shaped by band saw. A ***sample*** showed them what kind of work they might produce at a reduced cost of over ONE-HALF.

¶ A WASHING MACHINE man I met at the hotel was interested in my samples. He brought out his dasher parts and machine legs, and after comparing notes we agreed that for his work, to make parts cheap and in quantities, our method has his present one skinned a mile.

JOBBERS & CARPENTERS

¶ Then I went to see an old customer, an INCUBATOR factory man, and I can send you a copy of his letter stating he would not sell his machine for $5,000 if he couldn't get another to replace it.

¶ Numerous jobbers and carpenter shops whom I called on showe dme where they used the ***variety*** feature of this tool for making such stuff as screen door spindles, balusters, casings, dadoing, picket headers, star and corner blocks and variety work, with the ripping attachment being generally useful.



¶ At that time I did not call on any coffin and casket factories, but we recently received an inquiry from a casket and hearse manufacturer who was attracted by by one of our ads, and we were surprised to learn that our machine was just what they needed for making posts for hearses, casket corners, and handles, and other kinds of work, such as blocks, etc.

MISCELLANEOUS PLANTS

¶ These calls are not ***fiction*** but facts. I would like to call on you.

¶ A fine sample showing the work turned out by our method is yours for the asking.

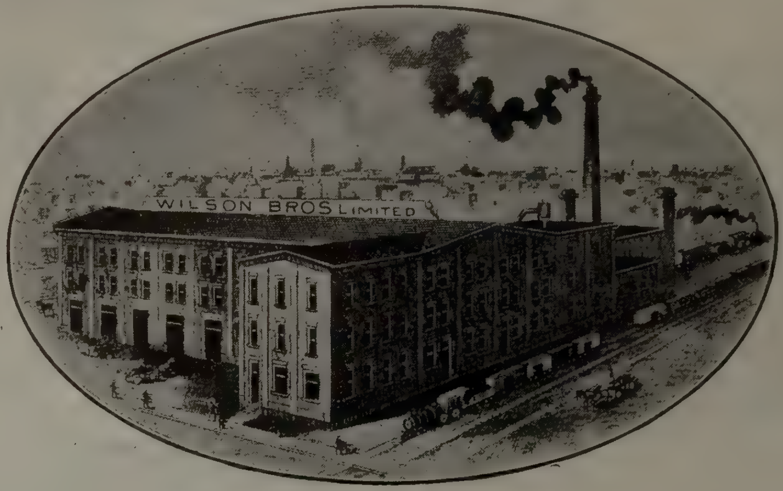
Four-Saw Bolter

P. Payette & Co.

Engineers and Machinists

Penetanguishene, Ont., Canada



Hardwood Flooring Department

Our hardwood flooring plant is one of the largest in Canada, equipped with the most modern machinery.

Our flooring is thoroughly kiln dried, straightened, hollow backed, bored, end-matched, steel polished and bundled.

Stock this brand and increased business will result.

Interior Finish Department

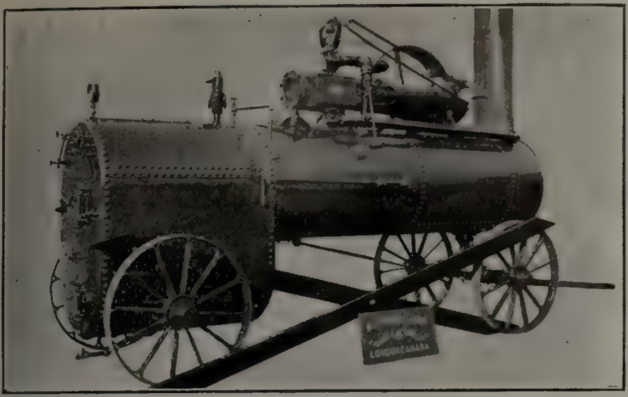
We manufacture a very fine line of veneer doors to detail—in fact it is our specialty.

Other products from our interior finish department include newels, sash, mouldings, balusters, wood turnings, etc.

Your customers are buying our goods — why not have them buy through you.

Wilson Bros., Limited

Collingwood, Ontario



BOILERS

We make Return Tubular Boilers in all types and sizes, for all purposes, ranging from 4 H. P. up to 250 H. P. per unit.

We have the most modern equipment for the manufacture of boilers and are prepared to turn them out on short notice to comply with all Provincial Inspection Laws.

ENGINES

We make High, Medium and Slow Speed Four Valve Corliss Engines, High Speed Automatic Engines, Sawmill Engines and Dairy Engines.

PORTABLE
SAWMILL OUTFIT

composed of Locomotive Boiler on Iron Wheels with Clipper Engine mounted on top of it. Especially designed for Portable Sawmill use. Many hundreds of these outfits sold for the lumber trade in the Maritime Provinces.

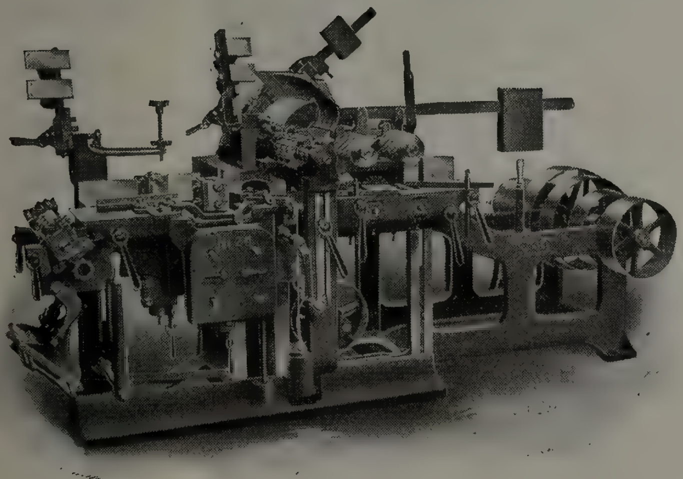
1911 Model No. 20 Outside Molder

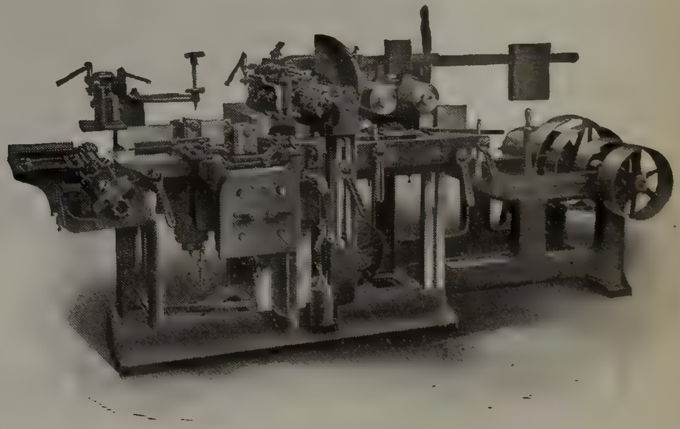


Built in 7″, 8″ and 9″ sizes.

We also build our No. 10 Heavy Pattern Molder in 9″, 10″ 12″ and 14″ sizes.

Some features on this machine are:

Patent Clamp Boxes to all Cutter Head Bearings
Elevated Feed
Micrometer Adjustments on Pressure Shoes
Outside Bearings to Feed Rolls
Front and Back Feed Levers



We also build Fast Feed Flooring Machines, Surfacers, Rip Saws, Edgers, Resaws, Cut-Off Saws, Tenoners, Lath Machinery, etc.

We want responsible Machinery Dealers to represent us in sections not already covered. Can offer liberal proposition.

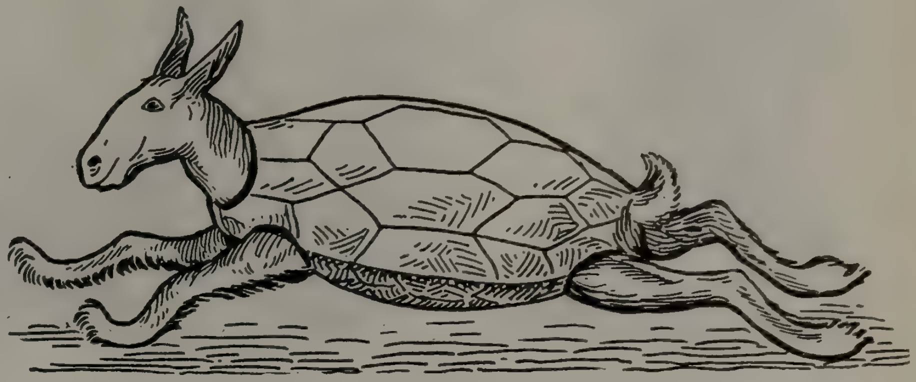
A WESTERN PRODUCT



EVERY MILL OWNER

Should Buy Saws Possessing the Qualities of the Trio in this Cut—Hare, Tortoise and the Mule

You Must Combine Speed with Persistence and Toughness to Receive the Best Results

YOU may work persistently enough in your mill, but if you want to catch up with modern progress and have a good bank balance, you must work up a combination of Speed, Persistence and Toughness. You must use saws containing a toughness that will persist in holding their tension at the speed you require, to increase the quantity and quality of your Lumber.

This is where Burtons' Electric Test Tempered Saws become necessary, as they possess the three qualities combined, and by using our saws you save time and vexatious delays, and get your lumber out faster and cheaper.

You can only obtain best results with an evenly tempered saw, and that is why our Saws are superior, there are positively no hard and soft spots in a Burton Electric Test Tempered Saw. A trial will convince you and assist us to convince others that Burton's Saws are the best. Send us your next order and be convinced.

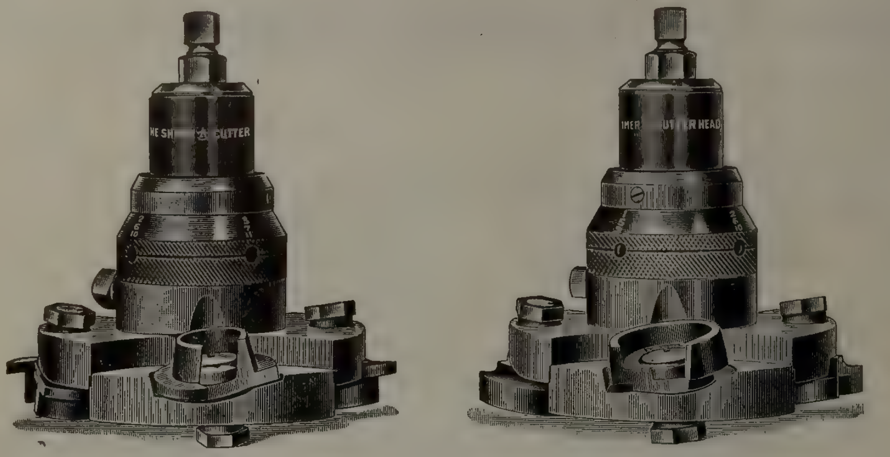
Shimer Cutter Heads and Cutters



Our "Best of All," Figs. 202 and 203, with 4 Bits to each Head.

Gutter Heads You Can Depend Upon

In buying Cutter Heads there is nothing more important than dependability. The tools that you can get assured service from are the kind you want.

The Shimer Cutter Head has been noted for many years for its absolute reliability, and for the dependable service that it gives to the machine wood-worker.

For matching Flooring, Ceiling, Siding, etc., or for forming Door and Sash patterns, the Shimer Head will give the greatest possible amount of satisfaction to the owner, operator and the purchaser of the product. Each is made in a separate Head of the same surface cut diameter, avoiding all changes of machine guides and assuring quick changes from one kind of work to another.

Every experienced mill man understands the important place good tools hold in the saving of time and labour. A tool that holds its shape through the hardest of work—that can be quickly sharpened without distorting that shape—that expands for different thicknesses by simply turning an adjusting ring which automatically locks and holds its adjustments—such a tool finds and holds its place for reliability and trustworthiness.

The Shimer Cutter Heads are the cheapest because you get the greatest value for the least money. They have every make-ready built right into them as a permanent feature, to save time of the planer man—to save fitting—to save changes of machine guides—little things that count in hours in favor of the tools and serve to make them the cheapest of all Heads.

You do not need to accept our word for it, or that of the many users of the Shimer Cutter Heads, but you can have a set to use 30 days, to be then paid for or returned, as you may find to your advantage.

Send us machine measurements to-day and we will run all the risks of fitting your machine.

OUR "BEST OF ALL"

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set, $40.95
Price with 6 bits to each head, the set, $49.27
Price with 8 bits to each head, the set, $57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—⅜ at $1.30 each and Bits for 2-in. thick plank at $1.63 each.

Write for particulars of the "Shimer Limited," the new High Speed Matcher Head which is self-centering on the spindle and has additional features of interest.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1¼-in., $31.20
Price, with 4 bits to each head, the set, 2-in., $33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and to interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1½-in thick, $34.84
Price, with 4 bits to each head, the set, 2½-in. thick, $35.88

Double Ceiling Heads.

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling Heads complete with Bits, net, $40.94

The Shimer Cutter Head for O. G. Batten and Siding

These heads are especially designed to work O. G. Batten or O. G. Siding, having three circular cutters in line of the cut, seated and firmly bolted to one side of the head flange.

We make them to suit any matcher or moulder. They turn out O. G. Battens as regularly as our matcher heads work tongue and groove flooring. Give measurements same as for flooring heads; or, if flooring heads are already in use on your machine, give their record numbers, and send a cross section of the batten—wood sample or drawing.

Price for each Cutter Head, without bits, $9.75. O. G. Batten Bits to mould ¾-in. deep or less, net each, $2.08.

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the counter of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One-way Cutters

The Shimer Reversible Cutters for Single Spindle Shapers, Variety Moulders or Freizers, are carefully moulded opposite to the shape of the mold to be produced, in such a way as to have only the cutting edge touch the lumber. They are complete—inexpensive—time saving. We also make One-Way Cutters for the Double Spindle Shaper.

Thin Steel Knives

Advanced ideas referring to the planing and surfacing of lumber have developed into the use of the thin blades, made from high speed steel, which when properly tempered and treated, serve for one or two days of work on hard maple, oak or hickory.

These blades are known as our Bedee Knives and are recommended by users as the best that can be procured. For the benefit of those desiring to use this style of a knife we have facilities to furnish them in any length or thickness.

Write us about your requirements.

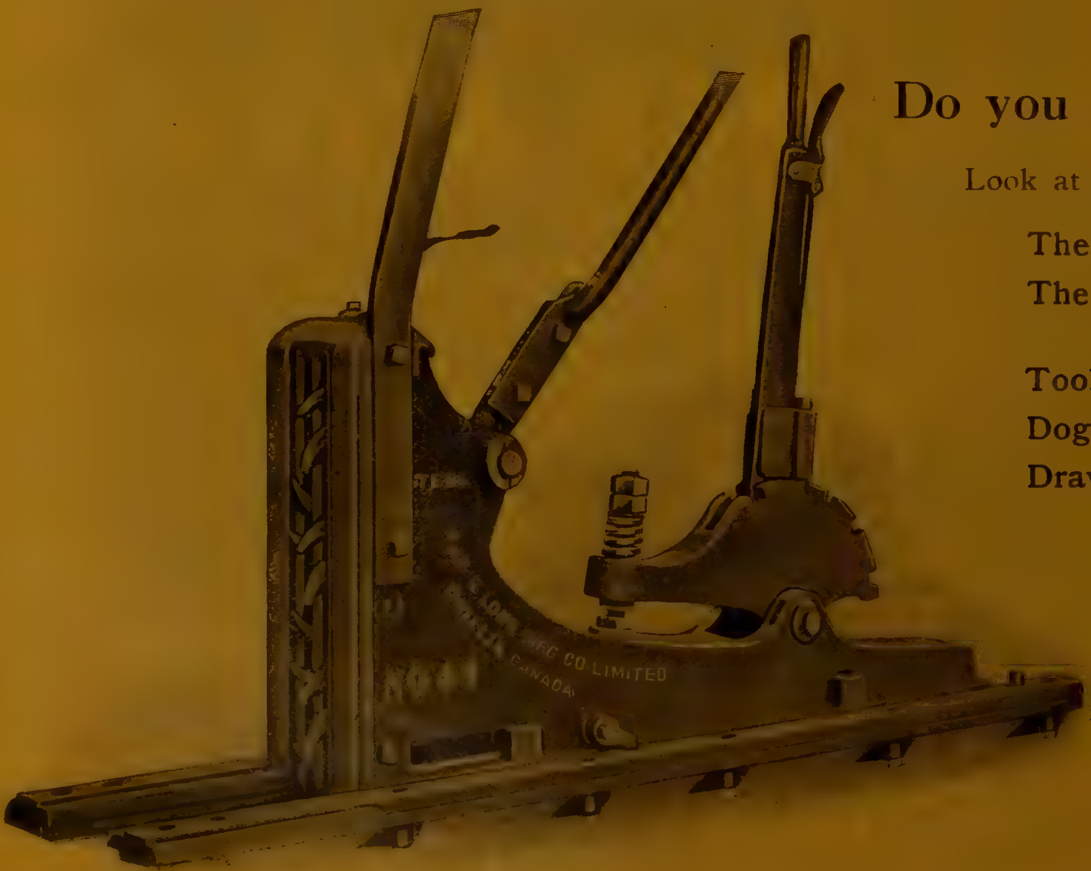
SAW CARRIAGES

We have specialized on saw carriages for a long time and know that our new steel carriages are just right in every way; we could not think otherwise when they meet with favor at the hands of the business manager as well as the mill foreman as these carriages have done.



Do you wonder?

Look at

- The heavy design.
- The shock absorbing quadrant preventing breakages.
- Tool steel forged boss dogs.
- Dogs have long sweep.
- Draw stock tight up to knee.
- The right dog for frozen timber.
- Rigid set shaft bearings.
- Large set shafts.
- Racks and pinions all machine cut.

More Power Means More Profit

USE "AMPHIBIA" BELTS

¶ Anything making for more power or less friction is of much interest to all belt users.

¶ To get the most possible power, speed and economy from belts is a problem we have studied for thirty years, and now we produce a practically perfect belt.

¶ "Amphibia" Belts will do more than just ordinary belts and with less cost for up-keep.

THERE IS AN "AMPHIBIA" BELT FOR EVERY PURPOSE

¶ "Amphibia" Belts are waterproof. They are not affected by steam, water, damp air or any similar adverse conditions. We guarantee them against opening of laps through exposure to water or steam.

Your Chance to Prove "Amphibia" Efficiency

¶ If you are contemplating the installation of any transmission equipment let us advice you more fully as to the efficiency of "Amphibia" Belts.

¶ Send us your enquiries. We can be of help to you. We agree that you first prove "Amphibia" merit before any cost to you.

GOODYEAR

Power-Saving Rubber Belting

Goodyear Rubber Belting stands for power saved and money saved. It is built up of plies of rubberized fabric cured and vulcanized into one solid piece. It neither slips nor stretches. It has the cohesiveness of rubber with the enormous tensile strength of close woven, long fibre cotton fabric from which ***all stretch has been taken out.***

Goodyear Rubber Belting is manufactured by a process that makes it proof against steam, water, weather and rot. Made in all three grades and all sizes. For Pulp, Paper, Saw Mills—*all* mills where horse power transmitted is large and demand for tensile strength great. Used by biggest lumber mills and manufacturing plants in the Dominion. *Outlives, outlasts* all other belts.

Rot-Proof Mill Fire Hose

Goodyear Underwriters is a hose built to meet the specifications of the Associated Factory Mutual Fire Insurance Companies. Tube used of highest grade NEW rubber. *Won't* harden or crack with age. Special circular woven fabric with least expansion or elongation under pressure. Antiseptically-treated to make it rot and mildew proof.

The strongest most reliable hose for all mills and factories. Insist on *Goodyear Underwriters, the hose with the black and yellow stripes.*

Non-Chipping Conveyor Belts

Built for all purposes. For conveying crushed stone, grain, coal, ore, etc.

Made in all thicknesses of face to suit requirements of buyer. Rubber face made of toughest stock possible, to prevent cutting and chipping. Gives longest, most enduring service.

We also manufacture other rubber goods such as tires, all kinds of hose and belting, rubber packing, etc.

Write us tonight for catalog and prices.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 **Toronto, September 1, 1911** **No. 17**

The Purpose of the Special Issue

The present issue of the Canada Lumberman and Woodworker is one which we anticipate will be received with approval by all who have at heart the continued welfare of the lumbering industry of Canada. In its preparation, the sole effort has been to bring together a varied selection of information and interesting reading, dealing with the several phases of the lumber industry.

In the advertising department of the paper, a result, in many respects similar to that of the editorial department, has been aimed for. It is beyond question that in the advertising pages of this issue there is food for much thought and study for those who wish to progress with the march of time. A man or a company hoping to keep abreast of the times must take advantage of every available source of information. Nowhere else can the essential information, with the chaff winnowed out, be found in so concise and entertaining a form as in the pages of a trade journal, and in no issues of a trade journal can the advertising be more thoroughly representative of the industry than in a special issue of this kind.

A trade journal must speak for itself. We feel that we are not entertaining a false hope in believing that the present issue of the Canada Lumberman will assist us in the future to do for the lumber industry what we consider to be our business duty. That we have been able to present to our readers so interesting a collection of reading matter and of advertising is due no more to our own efforts than to the co-operation which we have received from the trade it represents.

While it is fitting upon the appearance of an issue of this nature to feel pleased with results which have been obtained, we realize that there is still ample room for improvement, and it would be folly to consider that there is no call for criticism. Criticism is the motive power of progress. By it alone can we judge of the attitude of others towards our efforts. For any criticism which may be directed towards us, either in relation to this issue or to others past or to come, the Canada Lumberman will be grateful. We wish to know what others think of us, so that we may mend our ways when need arises, and so that we may be alert to utilize whatever opportunities present themselves for improvement in the future.

The duty of criticism, however, is associated with the privilege of co-operation. This is the last idea we wish to bring out in connection with this subject. Co-operation from all who are connected with the lumber industry is essential to the progress of any lumber journal. As a last word we would ask all who read this issue and who find profit from it, to join with those who have so generously contributed to it and to consider the Canada Lumberman as their special clearing house for information. Let us have your own ideas on any of the questions of the day in connection with the lumber industry, and we will pass them along to others who will benefit therefrom and possibly also do what they can to reciprocate in like measure.

The Value of Association Work

In previous issues of the Canada Lumberman there have appeared editorial opinions regarding the value of association work. Probably never before in the history of the trade was it more desirable that there should be whole-souled co-operation of men in all branches of the lumber business throughout the Dominion.

For long years there was not, until the establishment of the Canadian Lumbermen's Association, some three years ago, anything of the kind extending from ocean to ocean. True, there had been, and were, provincial associations, each doing splendid work, but they could not hope to accomplish what would be possible through the operation of an association of the trade covering most of the provinces of Canada.

Nor was the formation of such an association to be approached lightly, because of the very diverse interests which undoubtedly existed. It was claimed, and properly so, that what would be right in one part of the country might not work out satisfactorily in another. It was a matter requiring very delicate handling. No manufacturer, exporter or wholesaler, for instance, could possibly be criticized for desiring to run his own business in his own way, and it is probably largely owing to the fact that the Canadian Lumbermen's Association has studiously avoided appearing, even, to interfere with the individual rights of its members, that the success of the association has been what it is.

The effort has apparently been to overcome any prejudice or jealousy which might possibly exist between two men engaged in the same line of business. The "get together" idea seems to have been the ruling passion governing the operations of this association. The annual meetings held in Ottawa are undoubtedly a very valuable feature in the economic life of the lumbermen of this country, and together with the banquets of the association, at which jolly, good-fellowship and the joy of live and let live prevail, have undoubtedly developed a mutual confidence and esteem previously deemed impracticable.

Another very prominent feature is the fairness which has characterized all operations of the association since its inception. Whether called upon to adjust differences which inevitably arise in business transactions, or presenting evidence before Parliamentary committees, the Board of Railway Commissioners or otherwise, the constant effort has undoubtedly been to be fair and reasonable in all things. And while we must confess to feeling disappointment that the association as a whole did not appeal from the judgment given by the Board of Railway Commissioners in the freight rate case, there cannot be any possible room for criticism by the members of the association, of the presentation of the case or argument before the Board. Perhaps, under the circumstances, however, the association was right in accepting, without question, the final order and judgment of the Board in this case.

This all leads one to consider the effect or value of such an association to the trade. We think it will be conceded that this is incalculable. It will not be denied that having the machinery constantly at hand to present the views of so vast an interest as the lumber trade, in any quarter, is invaluable; and those firms who are not already members of this association should lose no time in strengthening the hands of the few, comparatively speaking, who have borne the brunt of the battle up to the present time.

There needs to be constant and enthusiastic use made of such an association by the members, and every member should feel a personal interest and obligation to help in every way possible in the work which the Executive Committee deems necessary.

One point which may be particularly emphasized, in view of what is transpiring on the other side of the line, is the fact that in no sense can this association be looked upon as a combine or trust of any kind. Even if the prominent men who are officially connected with the association could be capable of such a course, the fact that the membership includes our largest wholesalers, exporters and manufacturers, would at once indicate the impossibility of such an arrangement.

There are many other directions in which an association of this kind can be made of inestimable value and service, but as we have already remarked, the ultimate good can be accomplished only by each member doing what he can for the general good of the whole membership.

Uniform Grading Proposed—Association Idea Spreads

With reciprocity in the air and the lumbermen of Canada taking an unusual interest in the important questions of grading and inspection of lumber, and many other matters which concern them so vitally, it seems odd, to say the least of it, that they should overlook so continually one of the most serious features of the trade in lumber to-day. The inroads which have been made upon the lumber markets of Canada by the manufacturers of Southern pine provide one of the most serious features of the trade which have ever called for the attention of the lumbermen of Canada. If the southern pine which is imported into Canada were the equal or the superior of the classes of Canadian lumber which it supplants, and if it came into our markets on equal terms with the others, there would be nothing serious about the situation. It would have to fight every inch of its way and whatever sales it had would be the result of meritorious salesmanship or of the fact that the lumber filled the bill precisely for the purposes for which it was being purchased. But yellow pine in the Canadian market is a disturbing factor of the most pronounced type and its sales to Canadian consumers are in many cases the cause of financial loss to Canadian lumbermen, to say nothing of the loss to the consumer who does not, by a long measure, secure for his money a material which is equal in value to what he could secure for the same money spent upon Canadian lumber.

Canadian spruce, Norway pine and hemlock are the principal woods which suffer from the competition of the southern pine. For practically every use to which southern pine is put in Canada one of the Canadian woods will fill the bill equally well and in many cases will give better value to the customer. The objections to southern pine have been told time and again in these columns, and are the subject of frequent discussion among lumbermen, yet little is done by the lumbermen themselves to put an end to its inroads. If southern pine were on all fours with Canadian lumber in every other respect it would still be inexcusable on the part of Canadian architects and contractors to employ it in their buildings so long as they could get an equally good Canadian article at a reasonable price, because it is of all classes of lumber the most inflammable. It is a simple matter to put a match to a yellow pine joisting and set it on fire. It is so full of pitch that the danger of fire is greatly increased wherever it is employed. It would not be a difficult matter to draw up a list of instances where it has played an important part in the spread of distastrous fires in Canada. If an instance were wanted it could be readily supplied by the case of a terrible fire which occurred in a private residence in Toronto last winter. The house was pannelled in Georgia pine. The family were sleeping soundly, but in the middle of the night a fire commenced down stairs by a gas light coming in contact with the woodwork. Once it had obtained a fair hold it spread with such rapidity that by the time the occupants of the house had been aroused, all means of escape had been cut off, and several lives were sacrificed. In spite of this and other warnings the architects of Canada go on specifying Georgia pine as an interior decorative wood and as material for joisting, etc.

The situation is aggravated by the fact that in many cases the architects who are engaged for large business buildings in Canada are Americans. Much United States capital is being invested in Canada in branch factories and warehouses, and the American architects employed naturally specify southern pine. The salesmen of yellow pine companies have covered the country like a blanket and their product is now so well known that it is nearly second nature with the consumer to ask for Georgia pine.

Not the least important factor in the increased sales of yellow pine in Canada has been the additional profit which can be made out of it by the retailer and the wholesaler. Yellow pine is manufactured under conditions which make it possible to sell it in Canada at a price which gives the middleman a better profit than he can secure from Canadian lumber which might be used for the same purpose. A meeting of hemlock manufacturers and dealers was recently held in Toronto, a report of which appears in another portion of this issue of the Canada Lumberman. At this meeting the subject was discussed in considerable detail. The outstanding fact of interest developed at the meeting was that wholesalers and retailers in Canada have been obliged by the force of circumstances to push the sale of yellow pine. One large wholesaler and manufacturer of hemlock reported that he always sold yellow pine because of the better profit which he could make out of it. Others had the same story to tell. They all reported that although hemlock would give equal value for the money, and in many cases better value, they had been unable to sell their hemlock at a profit for some years, on account of the competition of yellow pine. They had in most cases therefore curtailed the production of hemlock in the hope of maintaining the price. But this had been of little use because when hemlock was scarcer it made just that much more demand for the yellow pine.

An aggravating feature of the market for yellow pine in Canada is the preference which the railroads give to it and to other United States lumber, in their orders. The Canadian roads are carrying large quantities of Canadian freight and making their profits out of it. One would expect them to do their utmost to encourage the lumbermen of Canada from whom they secure so much of their freight. Instead of this we find in many cases that the railway stations and many of the cars of the companies are built of United States lumber. The railroads secure in many cases government assistance. In the case of the Grand Trunk Pacific, the bonds on much of the road are guaranteed by the government of Canada. Other roads receive Dominion and provincial assistance, but they give as little assistance as possible to Canadian lumber manufacturers. The policy is unpatriotic, to say the least of it, and, inasmuch as it discourages the development of Canadian industry, it is certain in the long run to be unprofitable.

Were it not for the fact that the hemlock manufacturers of Canada find a good market in the Eastern States for their product, and also that the spruce and pine manufacturers are able to sell large amounts of their lumber there, the situation would be far more serious than it is. It is to be presumed that if reciprocity is carried, the market for Canadian lumber in the Eastern States will be more attractive even than it is to-day. It will naturally occur to the enquirer to ask why it is that our woods can sell in the United States in successful competition with yellow pine when they cannot do so in Canada. The answer is that in the Eastern States the inflammable nature of yellow pine is so generally feared that it is greatly handicapped, and architects and buliders, knowing the safer nature of the Canadian woods, specify them in preference to the yellow pine. In many parts of the State of New York it is almost a matter of impossibility to sell yellow pine for buildings of any importance.

The formation of an associatoion of hemlock manufacturers in Ontario which is now proposed, is a step in the right direction. It may reasonably be hoped that a vigorous association of this nature will be able to conduct a publicity campaign which will help materially in giving to hemlock and to other Canadian woods, in the Canadian markets, at least their proper appreciation, and may go far towards improving the demand for Canadian lumber, whenever it comes into competition with yellow pine.

Other factors have had a good deal to do with the failure of Canadian hemlock and other woods to compete successfully with yellow pine. An important one has been the lack of co-operation or organization among Canadians. How can it be hoped that hemlock, for instance, will ever compete successfully with southern pine, if the wholesalers and retailers tell their customers continually to use yellow pine The hemlock men are getting together now and if they do nothing else than agree upon a stiff plan of action which results in educating their customers to the use of hemlock instead of yellow pine, half the battle will be won, so far as they are concerned.

Perhaps the most important feature of the proposal for the formation of a hemlock association is the matter which really gave the proposal birth. This was the necessity for uniformity in the grading of hemlock. At present no one knows what is No. 1 hemlock or what is No. 2. In the cities it is one thing. In the towns and villages it is another thing. Even in the one town there will be a great difference between the so-called grades. The hemlock association, when it is formed in October next, will in all probability take up, first of all, this matter of grading. The members are all strongly in favor of having the grades specially determined and of having inspectors appointed whose duties it shall be to settle all disputes arising out of disagreements regarding grades. The man who is found to be in the wrong will then have to foot the bill for the inspection, and the day of disputes will probably soon come to an end, comparatively speaking. The Canada Lumberman has frequently impressed upon its readers the wisdom and the necessity of adopting uniform grading systems and of appointing grading inspectors for just this purpose. It welcomes gladly the proposal of the hemlock men and wishes them success. If their plan is properly worked out it may be that it will stimulate others and that the movement for uniformity of grading may extend to other branches of the lumber industry and be the means of eliminating the worst source of trouble in the lumber business of Canada to-day.

There is one aspect of the situation which will require study, and which any new lumber association to be formed in Canada will do well to consider in detail when they are organizing. That is, the relation which they will bear to the Canadian Lumbermen's Association. This association, which has its headquarters at Ottawa, has been the pioneer in the lumber association field in Canada. It has already achieved results which commend it to all lumbermen in Canada. It is quite possible that a local association, if it did not work in close harmony with the Canadian Lumbermen's Association, would endanger the success of that organization and work a great injury to the trade of the whole country. The ideal situation would be a number of local organizations in the different parts of the country, each conducted as a branch of the Canadian Lumbermen's Association. In the United States this has been worked out with much success. The local organizations are all branches of the National. Their fees are paid to the National, and the National makes them a per capita allowance for the management of their affairs. The hemlock manufacturers will have this question to consider when they are forming their organization and it is greatly to be hoped that by adopting some such course they will prepare the way for the establishment of many branches of the Canadian Lumbermen's Association in different parts of Canada, each of which will deal with its own local problems and will work in harmony with the parent association. In this way the usefulness of the Canadian Lumbermen's Association will be greatly enhanced and the power of the local association will be increased by the assistance and influence of the parent association.

Trade Report Branch Established by C. L. A.

The formation of a trade report branch by the Canadian Lumbermen's Association is a step which will commend itself to all in the lumber industry who desire to see the trade conducted on more business-like principles than have prevailed in the past. A similar step has already been taken in other countries and has worked out with much success. There is no question that the same result will occur in Canada. To put the plan in operation nothing more has been necessary than the preparation of blank forms which are sent out by the secretary, with questions printed upon them and spaces left for the members to write upon, giving the desired information. If the members of the trade will co-operate freely with this plan it is certain that it will do them a great deal of good. The principle source of difficulty in the trade to-day is the man who is unscrupulous enough to take advantage of other members of the trade whenever it is possible. By failing to pay bills, by taking advantage of credit and by kicking continually on shipments, such men are the cause of incalculable loss to the firms they deal with. The sooner they can be frozen out of the trade the better it will be for the trade and probably for the men themselves.

The information forms which are sent out by the association are carefully prepared and are calculated to furnish data upon which members of the association can depend when dealing with the firms reported upon. There is no reason for those who are requested for information of this nature to refuse it. Only those who are a discredit to the trade will find the system troublesome. The information requested covers everything that is essential in forming a good business judgment of the firm in question. Moreover, it will be considered as strictly confidential. It will be used for the benefit only of the members of the association and it will be an additional incentive for members of the trade to join the association, as in no other way will they be able to obtain such essential information. By giving frankly and fairly all the information required a member will be doing nothing which can be considered unfair to the firm in question and he will enable all others in the association to form a judgment upon which they can rely in their dealings with the trade.

This is the very class of usefulness for which the Canadian Lumbermen's Association was formed. In this way the association will appeal to the trade more forcibly than in any other. The large questions which have been handled by the association so successfully in the past, while they are of the utmost importance to the trade, do not appeal so strongly to the individual lumbermen as a matter of this nature. This will reach every member of the association individually and will provide him with something which he can actually measure in value as compared with the cost of membership. It is more than probable that this one step on the part of the association will do more to increase its membership than any other single thing which it has as yet accomplished. The co-operation of the members of the industry is essential for the successful working out of the plan. It is to be hoped that they will receive the co-operation in a measure which will rapidly make the trade report branch a success and which will increase the development and usefulness of the association.

Ontario Hemlock Association Proposed

Enthusiastic Meeting of Manufacturers Decides to Organize—Meeting Early in October—Uniform Grading and Inspection to be Introduced

An excellent meeting of representatives of the hemlock manufacturers of Ontario was held on August 16, at the Queen's Hotel, Toronto, at which there was a good attendance of representatives. Mr. J. A. Detweiler of the Quincy, Adams Lumber Company, Longford, Ont., occupied the chair, and Mr. W. J. MacBeth of Toronto, acted as secretary. The meeting was one which will probably mark an epoch in the hemlock manufacturing industry of the Province of Ontario, inasmuch as it was decided unanimously and with great enthusiasm that a meeting should be held about the first of October for the purpose of definitely forming an association of hemlock manufacturers. Another matter of the utmost importance was taken up vigorously at the meeting, and if the expressions of opinion on the part of the various members present is an indication of the results to be expected, one of the first things which the association will take up will be the matter of grading rules and inspection of lumber. It was the practically unanimous opinion of the members present that a definite system of grading for hemlock should be adopted by the manufacturers, and that, in order to enforce it, a board of inspectors should be appointed. Members of the association will then make their contracts subject to the inspection of the board and at any time when a dispute arises reference will be made to the board and the party which is found to be in the wrong will be obliged to foot the bill.

J. A. Detweiler
Toronto

Chas. McGibbon
Penetang

Norman Hocken
Otter Lake

As a result of information presented by the members present at the meeting it was estimated that the production of hemlock this year has been greatly curtailed. There was a supply of 100,000,000 feet accounted for, whereas at the same time last year the supply was about 180,000,000 feet.

Those in Attendance

The attendance at the meeting included the following: J. A. Detweiler, Toronto, representing Quincy Adams Lumber Company, Longford Mills; Chas. McGibbon, representing The McGibbon Lumber Company, Penetang; A. S. Nicholson, representing The Nicholson Lumber Company, Burlington; Robt. Lee, representing the J. D. Shier Lumber Company, Bracebridge, Ont.; J. J. Corkery, representing Trout Creek Lumber Company; Norman Hocken, representing the Hocken Lumber Company, Otter Lake, Ont.; W. J. MacBeth, Toronto, representing the Parry Sound Lumber Company; J. N. Dudley of Toronto, J. R. Summers, representing Graves, Bigwood & Company, Byng Inlet; Guy Long, representing The Long Lumber Company, Hamilton; James Lauder, Toronto, representing Speers & Lauder, and Robt. Driscoll of Bear Lake.

At the commencement of the meeting the members presented statements regarding the quantity of stock on hand, the quantity cut, and the market conditions.

Mr. Norman Hocken stated that the Hocken Company has about 1,500,000 feet on hand and that they expect to saw 2,500,000 feet more this season. They found the trade excellent and were unable to fill their orders, having orders for 2,000,000 feet at present. They propose taking out this year 6,000,000 feet of logs for next season's cut. Their cut for the present year will reach approximately a little over 6,000,000 feet, of which they have cut about 4,000,000 feet already. The prices which they have been receiving this year, and during the latter part of last year have been practically unchanged.

Mr. Corkery on behalf of the Trout Creek Lumber Company, reported that they have about 2,000,000 feet of hemlock on hand which they cut this year. Between 400,000 and 500,000 feet of this is No. 2. The prices they have been receiving are about the same as those of the latter part of last year. For No. 1 on a 10½ cent rate they are getting about $13.50 at the mill. Their stock runs heavily to No. 1—about 75 per cent. They have not as yet decided upon their plans for the coming winter. For No. 2 they have been getting $8.50 on a 10½ cent rate. The price of $13.50 for No. 1 includes 10, 12, 14, and 16 foot lengths one and two inch. Even at $13.50 they do not consider the manufacturing of hemlock profitable, taking into consideration the high cost of labor and supplies. The market situation will therefore be the determining feature in connection with their next winter's operation.

Mr. J. M. Bird of Bracebridge, reported that he was only dealing in hemlock in a small way but could give the meeting an idea of Mr. Greer's stock. Mr. Greer has on hand about 1,500,000 feet of hemlock, 25 per cent. of which is No. 2. Mr. Bird's own stock would not run to more than 500,000 feet. He found that it was not so hard to satisfy the public in regard to No. 2 hemlock in the cities as it was in the smaller places. In the cities the trade was always trying to secure joisting material in the No. 2 grade. This was not fair to the manufacturer. 30 per cent. of the No. 2 which the city trade was securing was good enough to compete against No. 1 in prices. He believed that there should be a specific grading for hemlock, as well as for any other kinds of lumber. There was really no other way of selling hemlock fairly. Every board should be sold upon its own merits.

Mr. Robt. Lee representing the J. D. Shier Lumber Company, of Bracebridge, said that they had cut this year about 4,500,000 feet and expected to cut another million feet this season. The sales this year had been fair. They had now on hand about 3,-

000,000 feet of this season's cut and none of last season's. The prices for the present year might possibly average up to those of last year. In their cut the J. D. Shier Lumber Company get about 25 per cent. of No. 2, and are making a little less than 5 per cent. of No. 3. For dead culls they were getting about $4 per thousand.

Mr. A. S. Nicholson, Burlington, reported that his company does not manufacture, but that they buy from 300,000 to 400,000 feet of hemlock per month. "It seems to me," said Mr. Nicholson, "there is something seriously wrong with the grades. I know that we will buy a car from one man and another from another man, and although they are supposed to be the same kind of lumber there will be a difference of $3 or $4 a thousand in the value of the lumber. It appears to me that No. 2 and No. 1 hemlock should be shipped separate. There is a lot of mill run hemlock shipped into Hamilton, and sell as much of it as No. 1, as possible to compete with the other fellow, and the other fellow is doing the same to compete with us. Our sales of No. 2 hemlock do not show up one half of what we buy. There is a lot sold with down tally in it. The way prices are in Hamilton, at present makes it necessary to conduct trade in this manner."

Mr. Chas. McGibbon, Penetang, stated that his company was manufacturing about 6,000,000 feet of which about 75 per cent. was No. 2. His company does not experience much difficulty in the matter of inspection of lumber, in connection with what they send to the cities and large towns. The country villages however, he asserted should be avoided by everybody. It seemed to him that there had been a shortage in the quantity of hemlock cut this year. He did not know what to suggest in order to steady the market. If they were to take out less logs the Americans would come in with their stuff. Notwithstanding that, he thought that the hemlock manufacurers should reduce their cut 25 per cent. this year. If everybody would do this his company would be glad to fall in line. Someone had stated at the last meeting that the manufacturers were in too great a hurry to sell their stock. There was no doubt about that however. The stock would sell if they had the patience. By way of a comparison Mr. McGibbon reported that at the first meeting of the manufacturers there had been present men who represented 40,000,000 feet, while at the present meeting the amount represented was about 15,500,000 feet. This was one of the reasons why he was inclined to believe that there was a shortage in the quantity of the stock cut this season. The Parry Sound Company were not cutting any hemlock. This would take out he supposed 15,000,000 feet. The other mills of Parry Sound, the Conger and Peter mills were manufacturing probably 20,000,000 feet which had all been sold to the Laidlaw Lumber Company, Toronto. He could not see therefore how it could be figured that there was a surplus of hemlock stocks. If the manufacturers would only satisfy themselves that this was the case it would do a great deal to steady the market. In 1907 there had been no such thing as No. 2 in the hemlock business. The trade was glad to get all the hemlock that the manufacturer could turn out, and they did not ask for a down tally. It was a matter to be greatly regretted that the trade had deterioriated so much since that time. He did not suppose that any business in the country had more intelligent men engaged in it, and more capital employed, and less organization than the lumber trade to-day.

The Competition of Yellow Pine

Mr. McGibbon referred with consilerable force to the southern pine situation. Great quantities of southern pine were coming into this country and being used in the construction of buildings all over Canada.

The public seemed to be ignorant of the fact that this lumber was of an extremely inflammable nature. When the joists of a building were constructed of Southern pine it was sure to be destroyed if fire ever got into it. This lumber was the thing they had to compete with, but the man who was putting up a house knew nothing about this. He had no idea but that he was putting up a safe building. He hoped that the public would be wakened up to the risk they were running in using such an inflammable lumber and that they would then give the Canadian lumber manufacturers a chance to sell a carload of lumber once in a while. Mr. McGibbon concluded with a brief reference to the reciprocity situation, saying that he did not think reciprocity would help the hemlock situation at all.

Mr. W. J. Macbeth, of the Parry Sound Lumber Company disagreed with Mr. McGibbon on this point, saying that the eastern States already took large quantities of Canadian hemlock and that if the duty of $1.25 per thousand feet were removed it would give the manufacturers that much of an advantage in competing for trade in that part of the States.

Another aspect of the case was presented by Mr. Guy Long of Hamilton. Mr. Long stated that he had recently been figuring on a bill for the T. H. & B. Railway. He had not the exact figures with him, but roughly speaking there were 380,000 feet of lumber in the bill of which 45,000 feet was in 35-foot lengths. He figured it at $29.25. It would cost him $27.50. A Chicago firm came in and beat him out by $1.50 per thousand feet, delivering the stuff. Mr. Long had asked Mr. Hocken whether he would put in hemlock stock at that price and he did not see how he could do it. He, Mr. Long, did not believe there was any use in trying to keep up the price of hemlock when yellow pine was coming in at such figures. There was more yellow pine used to-day than ever before. The dealers were switching over to yellow pine because they could not get the prices for hemlock. His own firm was not selling any quantity of hemlock, simply because it was sticking to the prices.

Mr. MacBeth asked whether it was not because of the better profit that retailers could get for yellow pine that they were pushing it to the disadvantage of hemlock.

Mr. Long replied that they could make $1.50 out of yellow pine. Georgia pine, number one common, 2 in., 6 in. and 8 in., dressed one side cost $19.50, or 1 x 10 boards up to 20 feet could be bought at the same price. A few months ago it could be bought for $18.50. They could sell that No. 1 Georgia pine dressed one side and get $28 to $30 out of it, while they could not get $25 out of the hemlock.

There was another thing that was cutting into the trade seriously. Cypress could be brought into Canada and sold at $27.50. This was called No. 1 shop. All the little mills around the country were stocking up with it. The white pine men would have to wake up to the situation or they would find their trade badly affected. Something had to be done. Every week his travellers were coming in and complaining of the amount of cypress that was coming into the country. If they looked up the records about the quantities of yellow pine and cypress that were coming into the country they would be greatly surprised.

Mr. Long stated that he would rather sell Georgia pine finish to-day as he could make more out of it. A man would come with a request for paint finish and he would advise him to take Georgia pine. It used to be claimed that you could not paint Georgia pine. But you could.

Mr. MacBeth differed with Mr. Long on this point and claimed that the paint would soon come off, if used for outside work.

Mr. Long stuck to his point saying that for inside work he had found it all right in his own house. The house had been built four years ago. He put Georgia pine in downstairs and used the waste upstairs in the attic and painted it. The paint was still on it in good condition. They sold car after car of 1 x 10 No. 2 common boards. Where was the man who would sell them 1 x 10 pine or hemlock all 18 foot lengths? They could sell the Georgia pine ahead of the hemlock and get $5 a thousand more out of it. The farmer would not take the hemlock in preference to it. Mr. Long believed that the trouble was that they were not in a position to regulate the trade. They were not united and they ought to be.

Reciprocity would give them a benefit of a dollar. It would raise the price a dollar here. Mr. Long believed that they could afford to sell their hemlock on the other side, and that the price was too high. They would either have to reduce the price or reduce the grades.

Architects Should Be Educated

Another feature of the demand to-day was the fact that there were a lot of United States firms coming into Canada and putting up buildings of all sorts in this country. They would not stand for hemlock. They wanted yellow pine. The result of the competition of yellow pine was that it was much harder to sell hemlock to-day than it was formerly.

Mr. MacBeth agreed with Mr. McGibbon that the yellow pine was an extremely inflamable wood. The matter ought to be brought forcibly to the attention of the builders. So far as the competition was concerned, when they dealt with the finished stuff in yellow pine it came into competition with the white pine, not with the hemlock. If Mr. Long would go carefully into the facts of the case he would not say that the price of hemlock was too high.

He would like to see something done in the line of establishing definite grades for hemlock. Although his company had not had any trouble in this connection, he knew that there was a lot of dissitisfaction with the shippers of hemlock. If there were official inspectors whose decision would be final it would do away with a great deal of the dissatisfaction. If anything could be done along that line it would be a great benefit to the trade.

Referring to the operations of his company Mr. James Lauder, of Speers & Lauder, Toronto, reported that they would take out this year about 3,000,000 feet. They had no old stock on hand,

and they had no trouble selling it. The prices they had been receiving were unsatisfactory.

Definite Grading Rules Necessary

Mr. Long interjected that he had not meant that the prices of hemlock should be reduced, without reducing the grades. He realized that with the high cost of stumpage and labor there was nothing in the manufacture of hemlock at present prices. He believed that an important source of trouble was the practice of putting up too good a grade of No. 2. The Toronto market had been ruined by this and it was now almost impossible to sell any No. 1 there. The No. 2 hemlock which they were selling in Toronto to-day was not No. 2 but rather merchantable hemlock.

Mr. MacBeth also took part in the discussion upon the matter of grading. The grading of hemlock to-day he said was certainly done in a hap-hazard manner. If there was any disagreement about shipment the other man's opinion was just as good as your own. They should have a definite basis for the settlement of disputes, and arrange that the man who was wrong should pay for the cost. A standard should be set and the manufacturers should form themselves into a regularly constituted organization with officers and a board of directors and then let the board of directors name committees and so forth, to handle the business. Then they could formulate certain definite grading rules to govern any disputes. An official would be appointed by the grading committee to look into a dispute and the people who were at a disagreement would each be required to pay a sum of money into the hands of the treasurer sufficient to defray expenses. The party who was found to be in the wrong would lose his money and the other one would get his money back. They might go on holding their little meetings of manfacturers until Doomsday, and do no good whatever, unless they formed some sort of an organization. There was a feeling among lumbermen that it would be a good move to form local organizations for Georgian Bay, Eastern and Western Ontario, and other important sections of the country. These local organizations could submit their ideas to the Canadian Lumbermen's Association, at Ottawa, as a National organization. It would then be possible in a large measure to bring about uniformity of trade customs throughout the country. There was a certain amount of uniformity that could be reached in connection with the grading of lumber and they should all endeavor to attain this end. In regard to the grading of hemlock he believed that bu putting up No. 2 as good as they had, they were making the grade of No. 1 too good. All 2-inch hemlock good enough for joisting should be classed as No. 1 and not good enough for a poist ought to be ripped into 2 x 4. By trying to give 2 x 6, 8 and 10 inch No. 2 quality good enough for joisting they were lowering the grade of inch No. 2 to shorts and strips.

Southern Pine Not Permitted in New York

As far as southern pine was concerned taking the New York State and city markets Mr. MacBeth stated that they would not let it be put into public buildings and warehouses there at all. They would not use it in large houses. The better class of architects would not take Georgia pine because of its inflammability. Yet in Canada it was being used extensively. You could put a match to yellow pine in a building and set fire to it without any difficulty. You could not do that if the wood used were hemlock, Norway or white pine. So far as the yellow pine situation was concerned he believed that many of the difficulties would settle themselves in time. In New York to-day, they would pay more for hemlock than for yellow pine. If the duty of $1.25 per thousand feet were removed it would have a decided levelling effect. It would give Canadian hemlock manufacturers a good market in the Eastern States which would care for their surplus stocks, taking it off the Canadian market and thereby helping to improve prices. They could get rid of their hemlock at $19.50 to $20 a thousand in New York state to-day, with the duty and a 16c freight rate to pay. They would surely be able to do a much better business if the duty were removed. Even as it stood to-day with a $1.25 duty against them they could do as well by shipping their hemlock down to New York State as to any other market. They could not get as good a price to-day in Toronto as in Rochester.

Speaking of the Parry Sound Lumber Company Mr. MacBeth stated that they were now cutting no hemlock at all and had practically none in stock.

Mr. Long drew attention to the fact that on many of the large buildings now being put up in Canada, American architects and American specifications were being employed, and that as a result the demand for Georgia pine was increasing considerably. He believed that a lot of good would be done if the lumbermen would persistently point out the facts of the case to the architects. He believed that the architects would no longer dare to recommend southern pine if they learned that it was such an inflammable material.

Mr. J. R. Summers, representing Graves, Bigwood & Company, said his company had not as yet cut any hemlock this year. It would be late in the fall before they would commence. Even then they would not cut very much. They had in stock now about 2,000,000 feet. They would probably have about the same cut as they had had last year. They had not yet decided whether they would operate in the bush on hemlock during the coming winter. They found the demand for hemlock very good at present. The demand for No. 1 was much better than for No. 2.

Determined Co-operation Necessary

Mr. Norman Hocken, of the Hocken Lumber Company, Otter Lake, Ont., also spoke at some length upon the subject of inspection and grading. This question, he said, had been before the trade for a number of years. It seemed to be either a very difficult question to settle or else it had been brought before a class of indifferent business men. He believed that the present situation was partly the result of one of these causes and partly of the other. They claimed to be members of one of the most important industries in Canada, and yet when an issue came up among them which required the co-operation of the trade they all sat back and hoped that someone else would take it up, and carry it to completion. If they wished to have the trouble settled they must go about it in a business-like way. These meetings of manufacturers had brought considerable success to the trade during the past year. They had met with considerable ridicule and criticism, and notwithstanding this they had also met with a large measure of success.

Mr. McGibbon questioned Mr. Hocken's statement that the meetings had met with ridicule, saying that they had been a considerable benefit to the trade, and that they were now getting $1.50 a thousand more for hemlock than last year, as a direct result of the meetings which had been held.

Mr. Hocken replied that this might be so, but they would all agree with him that their former meetings had received considerable ridicule. He believed that the originator of these meetings should be congratulated as they were the first step along the right line. Grading of hemlock was one of the most essential points at issue in the trade to-day. They had all felt this, more particularly during the past twelve months. It seemed as though the trade had drifted to such an extent that it did not know where it was at. One dealer had explained this situation quite nicely at the last meeting. He said that for a certain class of trade they supplied lumber from a certain mill, if another class of trade came along they supplied it from another mill, knowing that the customer would want something a little different from the first mill. Of course the prices were adjusted accordingly. He suggested that a committee should be formed of nine members, three of them to handle the business, six to be authorities upon lumber, two of the latter to be retailers, two wholesalers and two manufacturers. This committee should draft rules and bring them before the meeting of the manufacturers, so that they might be adopted as rules for the guidance of all members. Possibly after the drafting of such rules they might want to make a few changes and this would perhaps lead to difficulties and criticism. No man could be a successful book inspector, but a man could obtain a great deal of benefit from a book, and it would be possible for members of the trade to obtain much benefit from a definite set of grading rules. By way of settling disputes Mr. Hocken suggested that there should be two reliable inspectors and that their sales of lumber should be made subject to the decision of these inspectors in case of dispute. These men would act as arbitrators. The expense of their maintenance would have to be considered very carefully. He had thought it over himself, and come to the conclusion that these men would certainly have to be paid well. He did not think that to start out it would be necessary to have two men set aside to do nothing else but look after these disputes. He hoped they were not so numerous as to require two men to look after them. He suggested that all those who were interested in lumber should contribute a small amount towards the maintenance of the inspectors. This could be arranged upon a basis of so much per thousand feet of lumber. It could be set low enough that the one making the dispute would not be afraid to submit the case. They should not have it so high that they would be afraid to appeal to the arbitrators. He believed this would work out and be a benefit to all connected with the industry.

Mr. McGibbon suggested that the government be asked to appoint the inspectors. They were getting a large revenue already out of their timber and ought to be willing to give some value for it in this manner.

Mr. Hocken believed that this would be feasible, provided that the government would appoint someone capable for the work, and not have the position left open to political pull. The inspectors might be nominees of the association approved of by the government.

Mr. Hocken believed that Mr. MacBeth's suggestion for the formation of a hemlock manufacturers' association was a good one.

It seemed to him, however, that this should be the completion of the movement and that for their first subject they might possibly make a start lower down. He thought they could carry an inspection plan into effect simply as a matter of agreement, and to make it legal they could make all their sales subject to such inspection. He believed also, however, that the formation of an association should be the final goal.

Mr. MacBeth replied that he was still of the opinion that it would almost be impossible to do anything tangible, unless they had some head. They could not have the head without an association. They would have to have a president, vice-president, secretary, and treasurer, etc. They could not expect a busy member of the trade to devote all his time to the affairs of an association. The president and vice-president would not have any salary, their positions would be honorary. The only paid man would be the secretary. He could attend properly to all the correspondence that would come up in connection with the association. Then, the board of directors, of course, would have control of the business matters so far as the appointing of inspectors and looking after the general business of the association was concerned.

Mr. McGibbon asked whether they would think of making it a Canadian association.

Mr. MacBeth replied that his idea would be to confine it entirely to Western Ontario. The Canadian Lumbermen's Association at Ottawa would be a sort of parent association and the different local associations which might spring up would work in harmony with the Canadian association just as was the case in the United States with all the state associations in their connection with the National Association. Many of their ideas would be submitted to the Canadian Lumbermen's Association and in this way it might be possible to work out among the different sections of the country a workable measure of uniformity in their business methods. The local associations would be, so to speak, local legislatures, dealing with their own local affairs.

His idea in proposing that the Canadian Lumbermen's Association should be the head of the local ones was to make the movement as far as possible of a national character. Then any rules which they might formulate to govern their sales or terms would have a national bearing. They would not be fighting their battles individually as they were to-day. They would have an important national standing and would secure uniformity of grading.

Mr. Hocken remarked that in speaking at variance with Mr. MacBeth's suggestion he had had in mind the impression that it would be too much for them to undertake at first. The formation of an association was certainly what was required to make the movement complete. Possibly if they waited for the formation of an association they would be going on in the same way for a number of years before accomplishing anything. However, he could see nothing difficult about the formation of an association.

An Association to be Formed

Mr. McGibbon remarked that they were certainly getting along nicely. He remembered that at the meeting last year the idea was to get away from the formation of an association altogether. They were anxious then also to avoid publicity. However, there was no use in trying to do things in a corner. "I believe," he continued, "that it is right to form an association, and I would move that the next meeting be held about the first of October with a view to forming an association and that all the members on the chairman's list, and as many more as he can hear of, be notified."

The motion was seconded by Mr. Norman Hocken and was carried unanimously.

This concluded the business of the meeting and after about half an hour of informal conversation upon the subjects which had been under discussion, the members in attendance adjourned, well satisfied that they had taken a step which would work out to the general benefit of the lumber trade and industry.

A Year of Thrift, Exactness and Care

High Cost of Operation, Strong Competition and Fair Volume of Trade Have Distinguished 1911 Trade in Ontario

By Onlooker

WRITERS on economics in descanting upon the rewardsof industry are wont to put the lumber business in its broadest scope in the "extra hazardous" class, to borrow a phrase from the insurance business; so much of result depends upon the attitude of Dame Nature to the proposition. This, of course applies particularly to the producing end of the business. Man in his ingenuity has used the mechanism of railroads to bridge the tedious process of lumbering. This bas been especially the case in the south and west. In Ontario, however, the conditions, geographical and physiographical, have limited this application. Railroads are not so readily available nor the stand of the timber such as to warrant their projecting entirely for that operation. In the south and west logs cut to-day are in the mill to-morrow, but in Ontario we have to depend upon Jack Frost for roads, and streams and lakes to bring the logs to the mills. The last year has been on the whole favorable to this sort of operation. As against the winter of 1909-1910, the winter of 1910-1911 gave us generally good logging weather, and the winter operation on the whole in this section was satisfactory. There were exceptions in this as also in the experience of river driving, but no serious amount of logs were left back, and the costs were confined to what is the inevitable result of high labor and supply charges. Quantities produced were about the same as the year previous, and the output has been on the whole of the same general character. The lumber once produced the market is the next consideration. It is undoubtedly true that Canada is to-day in the best commercial position of any of the great countries. The unusual development of its natural resources has attracted a large consuming population which brings each year within its own borders a reasonable demand. This demand, however, is not sufficient to make us independent of outside customers, of which the United States is the most prominent. The very unsatisfactory condition which has prevailed there throughout the entire year has materially affected the demand for wood products, and has induced extra competition for the home trade.

In the face of all this, prices have been firm, with a tendency to advance. Our native hardwoods have been in especially good demand, at increasing prices; birch and basswood preeminently so. White pine holds strong in all its range, with the lower grades of culls sharing in this experience. Red pine, which has been inclined to dullness for the past three years, bears evidence of being increasingly sought after. Hemlock is the only wood whose position is uncertain. As compared with a year ago, the average price is higher, but some sizes and stocks are at times urged on the market and otherwise firmness is to that extent impaired.

To attempt to discern the future is always hazardous, and prophecy is only legitimate when it is limited to the interpretation of signs that are definite. Taking a present demand and a reasonably well-known supply, we can, by the association therewith of other basic conditions, arrive at a fair portent of the future. Crops must be admitted the chief controlling factor. With an unquestioned good harvest in Canada, with fair yields throughout the United States, Nature gives us a good basis for man's activities. The intelligence with which we shall project our activities on this basis must determine our prosperity. Whatever may be our attitude in matters political and economic, it must be generally conceded that all present constructive effort is towards equalized taxation, elimination of special privilege, the increase of opportunity for individual iniative, the improvement of social conditions—in a word, the increase in the usefulness and ability of the great consuming public. The unrest that has disturbed conditions in the United States for the past few years, turns principally on this effort, and it is undoubtedly true that although the end is not yet, progress is being made and the march is towards another wave of all-embracing prosperity. The presidential campaign of next year, which is even now being discussed, will add its measure of disquietude, but this will undoubtedly be only incidental, and not as pronounced in its effect as the last presidential campaign. In Canada, happily, the conditions which have caused disturbance within the borders of our neighbor country have not been so marked, and while our political affairs are engrossing, and economic problems demand their share of attention, they have not operated to affect and counterbalance the wonderful and most satisfying prosperity which we, as a country, are enjoying. Our present political discussion can hardly be said to affect the future of the lumber business, although reciprocity, whatever may be our general attitude to the proposition, will, undoubtedly, be of advantage to this particular industry. We need, for the good of this industry, the largest possible demand from our neighbors, but we need as well the development of our natural resources and an in crease in the population to take advantage of these natural opportunities.

The results of the year up to date, show that this has not been in any sense an exceptional year, but rather one in which the efforts of all those engaged in the business have been devoted to the proposition of good housekeeping. Costs have been greatly increasing, and more or less certain, and competition has set close bounds upon profits. This applies not alone to manufacturers, but to wholesalers and to retailers, and the proposition has been to apply the elements of thrift, and exactness, and care into all departments. There has been no advance that would guarantee a man a profit on his purchase. On the other hand there has been no decline, and generally speaking there have been no bad debts. It has been a case of taking care of the pennies, and letting the dollars take care of themselves.

Camp Operations in Northern Ontario

Detailed Description of Work in a Typical Camp—Cost of Material and Labor—A Forestry Student's Report of the Work

The students in the Faculty of Forestry of the University of Toronto are required as part of their course to spend at least ten days in a logging camp and make a full report on what they learn, the object being to familiarize them with the detail of logging operations.

The following description of the logging operations in large Canadian lumber camp is a sample of the completeness with which the information is brought together, photographs and drawings adding to the thoroughness of the description.

Location and Economic Conditions

The tract under operation is situated about forty miles west of Sudbury. The present cutting area is in the central and northern part of the township. This particular township has been logged for pine and spruce for the past seven or eight years. All of it is saw timber. The camp I was in (one of six in operation) was expected to cut 3,500,000 B.F. or about 70,000 pieces. The logs are dumped on A Lake and will be driven from here down the B Creek to the Spanish River, from the mouth of the latter they are towed to the company's mill at C. The mill is a double band one with two gang saws and a daily output of from 130 to 140 thousand.

The cutting is made clean as it is a foregone conclusion that the slash will be subject to fire the following summer so that nothing is left but the hardwood, and of this there is very little. Two rangers are kept on the tract during the summer to watch the camps and prevent fire if possible.—Cost $600.

Character of Forest

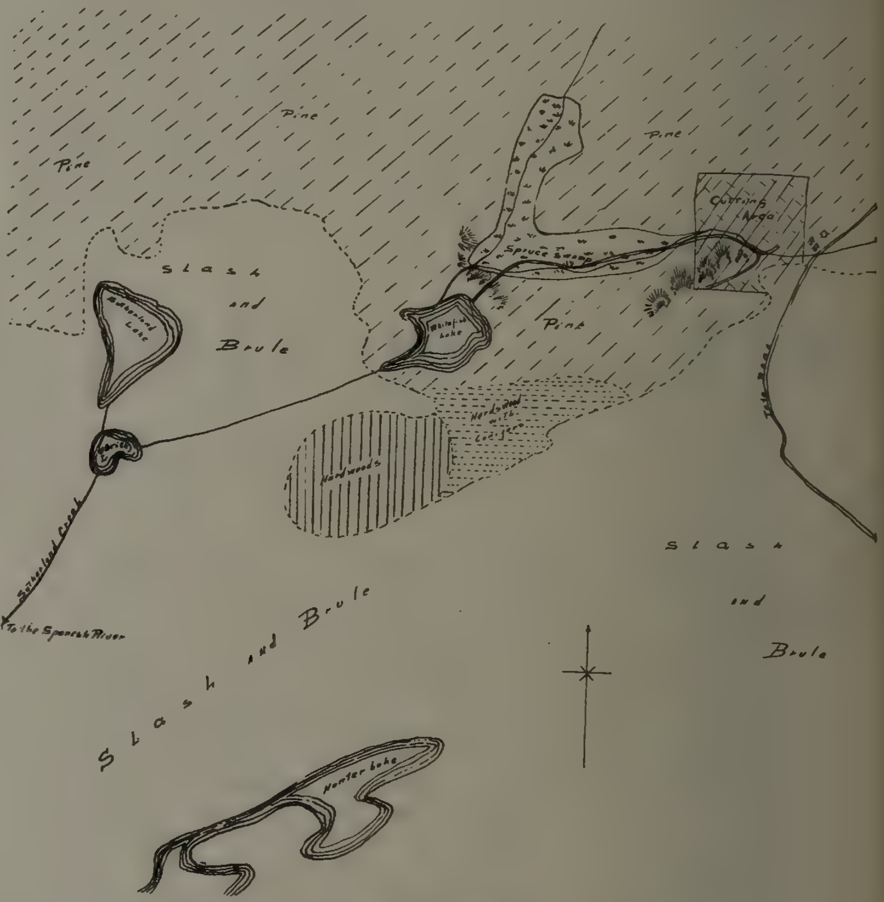
The topography of the country is typically Laurentian, being a system of rough broken hills and ridges of quartzite and granite with here and there a low swamp running sometimes for considerable distances between two ridges. These broken ridges make logging difficult and raise the cost of roads and in fact of all operations considerably. For instance, in this camp, part of a second main road had to be built, where if it hadn't been for a high rocky ridge one would have sufficed. On the other hand the swamps are a great aid to the logger in building cadge and hauling roads.

The tract presents three main forest types, namely: a swamp type of black spruce, black ash and yellow birch; a ridge type of white and red pine with a scattering of maple; and, on the better soils, a hardwood type of maple, oak and birch. The per cent. of the different species cut is about as follows: 5 per cent. spruce, ten per cent. Norway pine and eighty-five per cent. white pine. The spruce will nowhere exceed five thousand to the acre, while pine, though running as high as twenty thousand, will average between eight and twelve thousand. All the timber cut is suitable for saw timber under existing standards, and on the whole will run nineteen logs to the thousand. The timber is all remarkably sound, probably not more than two to three per cent. of the pine showing any rot or shake, although it is rather short and crooked in some places and nearly all the trees have spikes reaching to near the ground, but the knots are all sound and tight.

The climate is on the whole satisfactory for winter logging, there being fairly steady cold weather from Christmas on, and not too much snow. The thermometer frequently drops below zero and is readily noticed in the log makers cut for the day, and as plainly on the "sick list."

Cruising

The cruising and mapping of the limits is done by old woodsmen, or men with mill experience, who represent themselves as landlookers. The method employed is practically the "strip method," except that the whole area is covered and not only a certain per cent. A compass man runs the strips as far apart as the cruiser can be sure of seeing all the trees. The cruiser counts all the trees and at the same time guesses at the average log and the number to the average tree, and later multiplies this by the number tallied. The work is done by "forties." The topography is plotted in from measurements taken by "facing" and from what the cruiser can remember. Besides the cruiser and compassman a third man is taken along to cook and pack. The estimate is based on the Doyle Rule, and is supposed to tally pretty close to the bush scale, although it may vary from the mill cut as much as twenty per cent. It took three men a little over five and one-half months to cover the four townships. A cruiser receives $5 per day and found, while his helpers get ordinary wages. Cost of cruising and mapping, a little over two cents per acre. The cost is not on good authority.



Map of Limits

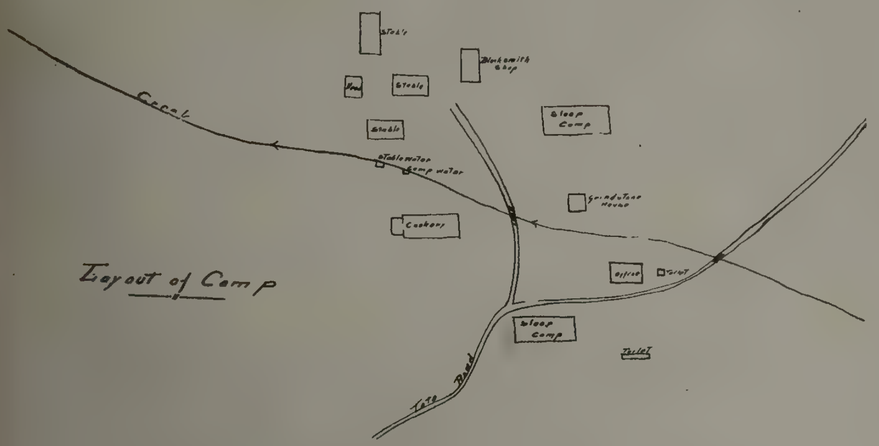
Camps

In locating a camp site one has to consider three things, first the accessibility of supplies from the railroad or town, second the proximity of the cutting area, and thirdly an assurance of good water supply. The above reasons decided the location of this particular camp, although, as will be seen from the diagram, the sanitary arrangements could have been improved. The area that can be logged from one camp is dependent on the density of the stand, character of the country and to some extent on the cost of building the camp, but ordinarily a radius of 1½ to 2 miles can be economically logged. This is an area of between five to six square miles.

As the timber used in the construction of the camp is cut on the ground, the density of the stand will largely decide the size of the clearing, but in any case an area of two and one-half acres is necessary. The larger the clearing the less danger there is from fire. The buildings necessary for this camp of 120 men were as follows:—Cookery, 50 ft. x 26 ft. plus 26 ft. x 26 ft.; bunk house, 55 ft. x 28 ft.; bunk house, 40 ft. x 28 ft.; three stables, 40 ft. x 30 ft.; store house, 30ft. x 20 ft.; blacksmith shop, 30 ft. x 25 ft.; grindstone house, 20 ft. x 20 ft.; office, 30 ft. x 20 ft.

The buildings were built entirely of pine, peeled and notched at the corner with the chinks plugged up with wooden wedges and then filled with a mortar of one part lime to five or six parts of sand or clay. The floors were of rough lumber, while the roofs were sheeted with the same and then covered with tar paper and lath.

To build such a camp a gang of twenty-five men and two teams were needed for three weeks. The tools and material used were about as follows:—2 doz. axes and handles; ½ doz. cross-cut saws; 2 hand saws (rip and cross-cut); 2 adze; 3 hammers; 2 kegs of nails (3 in. and 3½ in.; 1 decking chain; 1 pair of skidding tongs; 100 rolls of tar paper; 25 M. feet sheeting; 18 window frames; 2 grub hoes.



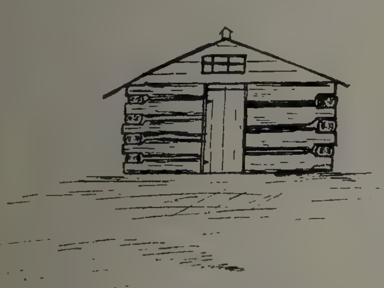
The cost of labor, food, material brought in, and allowing for the use of the tools in camp building would be between $2,500 to $2,700.

Cooking Outfit

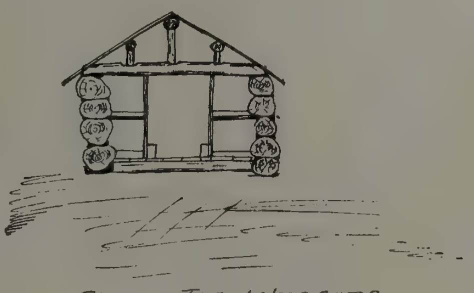
In the cookery were two six-holed ranges made by Butterworth of Ottawa, while the heaters were all of sheet iron with cast ends. Furniture was an unknown quantity except for the benches in the cookery and a few chairs in the office. For bedding, each two men were allowed three pair of blankets and an empty tick which they filled themselves with hay or hemlock sprouts. Bedding cost $820.

Food

The food supplied was plain but of good quality. The staple articles were salt pork, fresh beef, potatoes, beans, turnips, carrots, bread, cakes, pies, cookies, doughnuts, etc. The cook tried to run things so as to keep the cost per man per day below 60 cents, and on the average 50 cents per man per day would cover it. The proverbial salt pork was largely replaced by the fresh beef brought in, about 1,700 lbs. of this being used a month. The toting was managed on the following system: About one and one-half miles out of D. the company has what it calls headquarters. The toting teams load up at D. from the storehouse and drive as far as the headquarters, where they remain for the night. Taking an early start in the morning the teams land their loads at a second storehouse on the main tote road and about one mile from the nearest camp. After lunch here, the teams return to D. and then to headquarters as before. From this second storehouse the supplies are taken in by team from the different camps. The system allows of all the men and horses being in their own quarters each night. The number of teams hauling vary greatly, there being in the fall about twelve toting to the storehouse and on an average of two from each camp, while in the winter this number is cut in about half. In the fall the average load on the wagons is about 22 cwt., while on the sleighs it is 10 cwt. more. The toting costs from 14 to 20 cents per cwt.



Method of notching corners



Cross section of sleep camp showing manner of putting on roof and bunks

The Van

The van carried a stock valued at about $500, composed for the most part of wearing apparel and tobacco. The business done during the winter months amounts to nearly $1,200. The following were for sale:—Heavy rubbers, $2.50, mocassins, $1.25 to $1.75, shirts (flannel) $1.25 to $1.75, underwear $1.25 suit, socks 40c. per pair, tobacco 8 plugs for $1, stationery 35c. per box, sweaters $3.50.

The prices were but little above those charged at D. and only sufficient to cover expense of cadging. It is claimed that the business done largely depends on where the crew was picked up. A crew picked up in a town brings their own clothes, etc., in with them, while one that is taken off the drive and is in the bush most of the summer depended entirely on the van. An account is opened in the ledger with each man purchasing goods just the same as in any other business.

Blacksmith's Outfit

The blacksmith's equipment differs but little from the ordinary country blacksmith. The forge is built up of logs and filled in with earth and cinders and worked with a blower in place of the ordinary bellows. The outfit of the blacksmith and the handy man is as follows:—Vises, drill and bits, hammers, sledges, cold chisels, anvil, tongs, shoeing outfit, draw knife, shears, taps and dies, cross and rip saws, augers, ½ in., ¾ in., 1 in., 2 in., brace and bits, jack and smoothing planes, mortising chisels, gouges, small broad axe. This represents an outlay of $360. The blacksmith was paid $60 per month; handy man was paid $35.

Horses

The company's equipment in the way of horses would be hard to beat anywhere. They make a practice of summering all their horses at the headquarters mentioned before and besides fed inside in place of letting them forage on the poor pasture that is around it. During the summer they are fed just what will keep them in shape. The horses are, of course, mostly Clydes, and will weigh from 28 to 32 cwt. per team. Cost between $450 and $500. Hay, oats and an occasional feed of meal are given, one and one-half bushels of oats and about 60 lbs. of hay, at a cost of $1 per team per day. During the hauling season they are allowed a little more oats. The harness used is of exceptionally heavy construction. A noticeable feature of it is the breeching, which is attached by a broad strap to the neck yoke or rather to a short whiffle-tree on either end of the neck yoke, which gives a team enormous power in holding back. Harness costs from $40 to $45 per set and should last, with good care, for ten seasons. A harness maker is kept at headquarters to repair harness for the six camps.

The Sprinkler

Sleds, Snowplows and Sprinklers

Two types of snowplows are being used, one home-made and the other a patented affair. The former is built of two heavy Norway timbers 12 ft. x 6 in. x 14 in., their two ends being hinged to form a "V." Three-fourths of the way back two lighter brace timbers are hinged to the inside of these, overlapping and held together by two iron bands. By means of the latter the plow can be adjusted to any width desired or in running light could be brought almost flat. Two teams are used. The "patented" plow consists primarily of two solidly built sleds connected by a heavy timber down the centre to which the flanges and wings are attached. Just back of the front sled and working in two guides fastened to the end of a cross piece are two wings that could be raised or lowered and used for taking a crown off the road. To the front of the hind sled, and also working up and down in two guides, are two mould board arrangements of steel that take the place of a rutter and also throw the snow outside of the track. Hinged to the runners of the hind sled are two wings with an adjustable brace that throws the snow still farther out.

The roads are watered once a day by means of a sprinkler made at the camp. This is mounted on a pair of sleds similar to those used for hauling, except that they have knees at either end so that they can be run in either direction. On these is mounted a tank 8 ft. x 6 ft. by 5 ft., built of inch lumber and the cracks plugged with wedges and filled with putty or paint and the whole tied solidly by two straps of iron, one at either end. Holes are bored in the centre of either end to water the centre of the road, and also two underneath with a tin spray arrangement to put the "combing" on the track. The method of filling will be seen from the diagram. The tank will hold about 40 bbls. of water. Cost, $75.

Sleigh Hoist

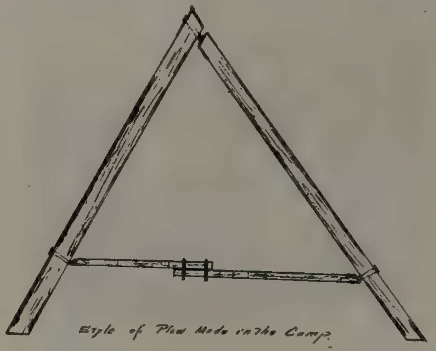
About three-quarters of a mile from the dump on the main hauling road there was an up-grade haul of about ten per cent for

300 feet, and here it was necessary to put in a sleigh hoist. The engine used is of the ordinary donkey hoist type, upright boiler, two cylinders, 7 x 10, double friction drums and rated at 20 h.p. This is mounted on two heavy Norway skids and securely guyed at the top of the slope. A light haul back line runs through a couple of blocks on trees at the side to the bottom. The main line, instead of running directly to the bottom of the hill, runs through a snatch block fastened by a short cable to a tree across the road from the engine and in this way the pull is directly up the centre of the road in place of being to one side. The teams unhitch at the foot of the hill and the main line is attached by means of a short chain and hook. Cost of engine $1,600; engineers paid $70 a month.

Tote Sleds

Tote Road

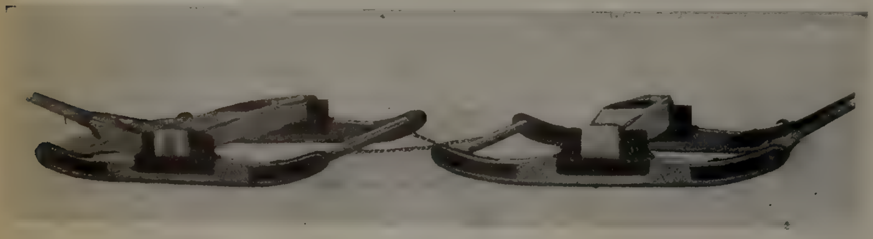
The camp being situated as stated above about fifteen miles from the railway, necessitated the building of that much tote road, but, as all the country between it and the railroad had previously been logged, the greater part of the road was already built when the company came into possession of the timber in question. The topography of the country was such as to make the road very winding and in some places have very steep grades, amounting to as much as twenty or thirty per cent., although it was made a point to have the worst grades towards the camp so that nothing but the empty sleighs had to be hauled up them. Figures on the time and cost to build this road could not be had since the same company did not build it all nor was it built all at the one time, and also from the fact that at the time of construction a camp was being built and the labor was shifting between one job and the other. However, judging from the nature of the country, I should think that different miles would cost from $500 to $1,000, possibly averaging $600. The improvements on the road in the way of bridges, culverts, fills and corduroy were of variable structure to suit circumstances, some of the methods resorted to being shown by diagram. In putting in corduroy, poplar, birch and jack pine were used when they could be secured. Very little cutting was done except where the road crossed some of the higher ridges. Where the road crossed the Spanish River all supplies coming in in the fall had to be ferried across on a scow. A heavy cable was strung taut across the river and from two blocks on this a short stout chain was fastened to either end of the scow on the upstream side. The contrivance was either poled or pulled across by pulling on the cable, an operation for which some of the "jacks" used sweet language in describing.



Style of Plow Made in the Camp

Logging Roads

To get the logs out this winter it was necessary to build about twenty miles of hauling roads. These were located in the fall by the foreman who walked over his cutting area (approximately one mile square or better) and sized things up, laying out his roads and skidways accordingly. The main hauling road followed for the most part a spruce swamp and in this way got a good grade, except where it crossed a ridge to the dump. Here it was necessary to install the sleigh hoist mentioned. Several places on the smaller hauling roads would need a tow team. The main road, three and one-half miles long and forty feet wide, required seventeen men, three weeks to build. With the use of a team needed part of the time this would involve a cost of nearly $200 per mile. This was on level ground, in small timber and requiring no rock cuts; the other roads, on which I could get no definite information, probably cost two to three times as much. A method used in leveling the main road was to divert a small creek nearby into the hollow places and allowing it to freeze, which besides leveling the road iced it as well. Where the fills were too large to be filled in with earth they were corduroyed or even a crib work with stringers and flatted cross pieces were used. Birch, ash, poplar, and maple were used for this. Grades as long as they were in the right direction were of no objection except in so far as they had to be sanded. The worst grades would run as high as fifteen per cent. A crew of eight to ten "road monkeys" are kept busy during the hauling season repairing bad spots, besides the sprinkler crew. They try to cover the roads once a day with the sprinkler and in daylight if possible, but owing to the weather very often it becomes necessary to put on a night crew as well.



Tank Sleds

Felling

The cutting was done by eight crews of three men each, a notcher and two sawyers. Notcher $32 a month; sawyers $30 a month.

The equipment of a felling crew consisted of one poll axe, one six-foot Simond's saw, a pair of felling wedges, a three-pound sledge, and a pole 8 feet 3 inches long. Cost, wedges, $2.50 per pair; sledges, $6 per dozen; axe handles, $5 per dozen; axe heads, $8 per dozen; saw, $4.75 each.

For log making most of the notchers preferred the poll axe, as they claimed it didn't catch in the brush and one was not so liable to cut himself when working in a small space. The wedges were all nicked with the corner of a cold chisel so as to make them stick better in frosty weather. The Simond's saw was used exclusively, and the saws were gone over once a day by a filer who traveled through the bush with a spare saw which the crew used while he was trimming up their own. For a vise the filer cut a good sized sapling about four feet from the ground and in the top of this sawed a deep nick into which he wedged the saw while filing. The method of procedure in felling was as follows: The notcher sized up his tree and notched it accordingly, and while the sawyers were felling this one he notched the next, or, in this timber, possibly two or three more. When the tree was down the notcher started from the butt and marked it into log lengths, clearing away the necessary brush as he went and also "topping" it. In case a tree breaks in felling the notcher is supposed to chop out his share of the break. As regards the choice of lengths of the logs, the orders to the foreman in this respect were as follows:—

Snow Plow and Rutter

Norway.—Logs 15 in. and over cut one-third, each 12, 14, 16 ft. Logs that are straight 8 in. to 14 in., cut 18 ft. long. All other logs to be cut 12, 14, 16 ft. long, as the tree will work to the best advantage. Take to 7 in. at the top. No choice in log lengths. Take chunks and crooked logs down to 8 ft. long and 10 in. at small end.

Spruce.—Take down to 6 in. at the small end. Get logs 12 ft. to 16 ft. with as many as 16 ft. logs as consistent. Get all the spruce you can.

White Pine.—Take down to 7 in. at the small end. Smooth logs to be made as largely 16 ft. as possible. Coarse logs to be made about one-third each, 12, 14, 16 ft. Crooks, crotches and broken pieces to be taken to 8 ft. and 10 in. tops.

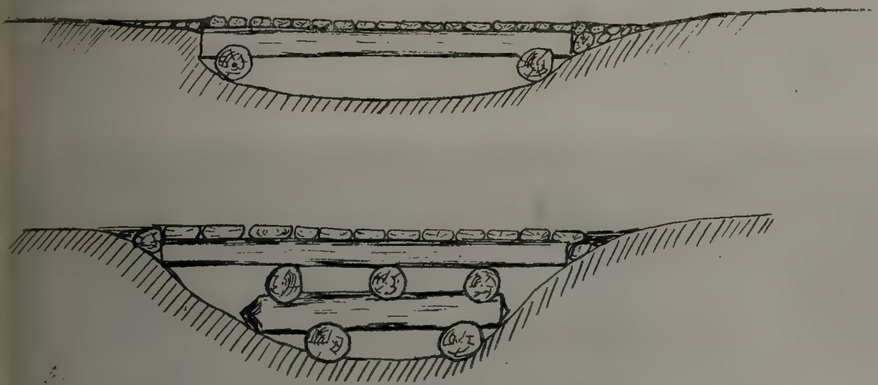
Trees with Crotches.—When you can cut up as far as the crotch in so far as it is consistent with above.

Arrange your cut and country so as to get the best timber without disadvantage to the remainder. In this particular timber a felling crew would work up any where from 100 to 225 logs per day. Any logs cut above a number set by the foreman went to the credit of the crew in the "bank," and could be drawn on when the daily cut was below the set number. The cut on frosty days was noticeably low. Eight crews started cutting after the middle of September and were through the first week in January. The cost of felling and cutting into logs was $1.10 per thousand.

Snaking and Skidding

The skidding was done by a crew of from six to ten men and two teams. Two teamsters, $32 per month; one roller, $32 per month; one sender, $30 per month; 1-6 swampers, $26 to $28 per month.

The equipment consisted of two pair short doubletrees, $3.50 each; one pair skidding tongs, 1¼ in. Hex., $4.25 per pair; one skidding chain and round chain hook, $3.50 per doz.; one swivel grab hook, $9 per dozen; one marking hammer; two piling cant hooks, $12 per dozen; one decking line, 12c. per lb.; two blocks, $1.25 each.

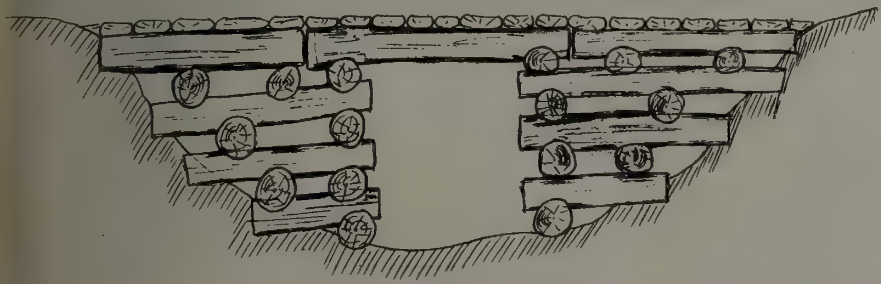


Bridges on the Tote Road

The yarding and skidding was done as follows:—

The swampers cleaned the logs of all branches and knots, cut trails to the skid roads and left all in readiness for the skidding beams. The number of swampers to a crew varied with the size of timber and the length of haul, but on an average 4 swampers were required to keep a skidding crew going. When the logs had been swamped off the teamster hooked on his skidding tongs or if they were small bunched several of them together with a short chain and hook, then grabbed the tongs or chain with a swivel grab hook on the doubletrees and drew the logs to the landing at the skidway.

The skidways are located when the foreman lays out his hauling roads. The skids are usually of Norway placed about 6 ft. apart and with a decided slant towards the road so as to have what the "jack" calls a "fly skidway." Besides Norway, maple, birch, white pine and in fact almost anything is used for skids except poplar. The skids are not taken up when done with. The first couple of tiers of logs in the skids are put up by hand but after this a gin pole is rigged at the side and a block attached to the top of it and another block fastened to the centre of the pile. A 60-ft. decking chain runs from the decking team through these two blocks, down around under the log and back behind the log where the one skidded is to be placed where it is fastened with a small dog. When the pile gets too high to be skidded right off the ground a couple of light skids are cut and placed against the front of the skidway. One man called a "sender" stood in front with a short cant hook with a small spike in the end of it and guided the logs up the skids while another on top called a "roller" fixed the dog and placed the logs as they came up to him. The number of logs to a skidway varied anywhere from 100 to 1500 and a skidding crew in this timber put on the average about 200 logs a day. The cost of snaking and skidding was $1.80 per M.



Bridge on the Tote Road

Hauling

The company starts hauling about the first week in January and tries to be through by the middle of March because, while the ice on the lake might hold out longer, the snow in the bush can not be depended upon. The average length of haul for this camp was a little over 3¼ miles and a team made 3 trips a day to the rollway with an average load of 50 logs. The logs were being dumped on the ice on the lake.

The sleds used for hauling had a 5 ft. 8 in. gauge and were made by the company for $60.00 each. The runners were for the most part yellow birch 4½ in. wide and also some of hard maple but these, it was claimed, didn't stand the weather well while oak was preferred to all. The runners were hewed out in pairs and rip sawed afterwards. These were shod with ½-in. iron shoeing brought well up over the nose and heel. The beams were of birch or oak 12 in. x 18 in. partially let into the runner and then strapped on. Each beam was mounted with a ¼-in. "rocker plate" to receive the weight of the bunk. The bunks were 12 ft. x 14 in. by 18 in. tapering a little towards the ends and hewn out of Norway pine. The back as well as the front bunk swung on a 2-in. gudgeon pin which went through the bunk and beam and was keyed underneath.

The outer ends of the bunks were joined by two "sway bars" fastened to them with eye bolts. The sleds were joined by ⅝-in. cross chains running from the roll of the back sled to the opposite corner of the front beam and fastened with an eye bolt. In the end of each bunk a 2-in. hole was bored to receive the corner binds. A loading crew consisted of 2 senders, $30 per month; 1 top loader, $32 per month; 1 tailer, $28 per month.

In loading the bunk load was put on and the two outside logs bound with the corner bind chains. The rest of the load was then put up with a decking line for four or five tier more when the wrapping chain was put on. The latter was fastened to one sway bar by passing the free end of the chain through a ring in the other end and then passed over the load and was fastened to the other sway bar by a toggle chain. The latter is a short chain fastened to the bar in the same way as the wrapping chain and having on the free end a long grab hook to catch the wrapper. The top load is now put on and binds the whole solidly. Loading, hauling and dumping cost $2.85 per M.

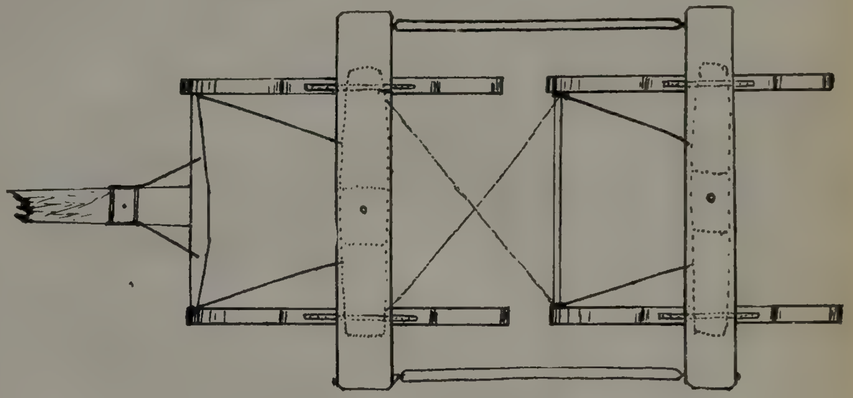


Diagram of Hauling Sleds

Scaling

The scaling for the six camps was done by three scalers who received $60.00 per month. The Doyle rule was used altogether and it was expected that the mill cut would over run the scale by about 25 per cent. The clerk and scaler working together, the scaling was done as follows: The scaler carried a scale stick, a tally board strapped to his left arm and some heavy blue crayon while the clerk carried only a scale stick. Going to one end of the skidway the clerk measured the diameter of each log and called it out to the scaler who then measured his end of the same log and put down the smaller number as the diameter of the log at the small end. Allowance was made in the diameter for defects which were allowed for by the scaler from his experience in the company's mill. As each log was tallied it was marked with the crayon. To be sure that both men were at the same log a system of manning the logs was devised the working of which is shown in the diagram. To check the scale, the government sends in a man who is supposed to scale one quarter of the skidways. The two men would scale on an average of 3,000 pieces in a day. Scaling cost 2½ cents per M.

Summary

Summing up then we have the cost of laying the logs on the ice as follows:—Cutting, $1.10; yarding and skidding, $1.80; hauling, $2.85; scaling, 2 cts.; interest on money and depreciation, 25 sents; total, $6.02 per M. Stumpage should of course be added in here.

Driving

The company drives its own logs only as far as the Spanish River where the Spanish River Driving Company take charge of them as far as the sorting jack at the mouth of the Spanish. The Spanish River Boom Company here sort and bag the logs ready for towing to the mill. For towing, the logs are put in lake booms, the boom sticks being of heavy timber and only 12 ft. long and extra precaution an "apron boom" is put in the outside of this so that any logs jumping the main boom will be picked up and not lost. In towing through narrows such as are encountered at Little Current between Manitoulin and the mainland the boom is narrowed by running heavy chains called "traverses" across the boom and pulling it narrow.

Condition In Which Forest Is Left

From the forester's standpoint the condition in which the land is left is anything but satisfactory. As stated before, it is clean cutting and nothing left but a few hardwoods, and as these occupy the better soils the result is that the poorer soils are left exposed to all the wasting agents. A more desolate looking piece of country could not be imagined than that lying north of D. If reproduction should happen to make a start it is promptly burnt during the hotter months of the summer and the result is that the soil, shallow to start with, under the influence of fire and natural agents is yearly becoming poorer. If fire were now kept out it is probable that the land would be stocked with jack pine as the only tree able to subsist as it is to some extent doing in the older slashes that have been burnt so often as to be now "fireproof." As regards the timber wasted, if you can call it such, by being put into roads, etc., there is not really very much of any value wasted, at least while being so far from a market. As stated before the material used for this purpose is mainly poplar and birch. In a good many casts, stumps might have been taken closer, and this is one of the things I would advocate if asked for suggestions for improving the present methods. Another suggestion would be in regard to the fire question. In timber of this size the notcher of a felling crew has a "snap." He could easily enough, while keeping the sawyers busy, swamp off the tops sufficiently to let them fall flat on the ground so that they would always be more or less damp and would decay the faster. Again, if a foreman was made to clear a line say 100 feet wide along the edge of his slash where it borders on green timber it would go a long way towards fire protection. Such a strip could be cleared, if not burned, for $10—$15 a mile, and, whereas the added cost would be hardly noticeable, the protection afforded would be immense.

A Hard Day's Work Ahead—Typical Log Dump in Northern Ontario

Messrs. J. & W. Duncan of Montreal are erecting at Weir, Que., a third mill. It will have a capacity of 50,000 feet per day and will cut chiefly spruce and birch.

A Fredericton, N. B., despatch says that the recent rise of water has greatly helped the corporation drive, the big jam at Grand Pas having been broken up and the logs running past the city to Mitchell's boom.

James Webster and Bro., Limited, Bootle, Liverpool, England, have opened a branch office at News Chambers, 57 Hope street, Glasgow, Scotland, and are in an excellent position to deal with shipments for that port, as well as shipments for the manufacturing districts of the Clyde and West Coast of Scotland generally.

The British admiralty recently gave to the Morseby Island Lumber Company of Queen Charlotte Islands, B.C., an order for 200,000 feet of white spruce. The material will be used in the manufacture of oars for the row boats of the warships. "The superior quality of the white spruce grown in the Queen Charlotte group was discovered years ago by British naval officers on the North Pacific station," says Mr. J. E. Corlett, general manager of the company. "This kind of timber was found to be ideally adapted for making oars and it is now used exclusively for that purpose in all His Majesty's vessels throughout the world. The same material is being used for making bobbins in cotton factories. Recently we shipped ten carloads to a Boston firm. Experiments made in California and Australia have also demonstrated that white spruce is superior to any other kind of wood for making fruit boxes and butter tubs because it will not taint. The demand promises to assume large proportions." The company owns hundreds of square miles of timber limits embracing yellow cedar, white spruce and hemlock on the Queen Charlotte Islands. Its sawmill is located on tidewater at Skidegate Inlet. The construction of three large plants with a combined capacity of over 450,000 feet daily is contemplated, and one of them will be started next season. Provisional plans have been prepared for submission to the board of directors. The company's timber limits have been estimated to contain over two billion feet.

Varying Views on Grading Proposal

Montreal Lumbermen Disagree about its Feasibility — Protection to Honest Trader—Some Think it impracticable

Montreal, August 22:—Mr. W. Duncan of J. & W. Duncan, Montreal, in a recent interview with a representative of the "Canada Lumberman" expressed emphatic approval of the proposals for grading and inspecting lumber. He pointed out that the present system was very unsatisfactory, and referring to pine, particularly, commented upon the expense and inconvenience of a buyer having to journey to some distant point in order, when purchasing goods, to inspect them. This was due to the fact that there were no established grades of lumber anywhere in Canada. Such journeys and expense would be obviated if each large district would adopt a grading system under which a man would be reasonably sure of the goods which he was purchasing. If the grades were well defined it would do away with practically all the present uncertainty and would put an end to a large proportion of the disputes which now are inevitable under present conditions. Mr. Duncan is of opinion that in order to apply uniform grading and inspection successfully, it would be necessary to obtain an act of parliament which could be obtained through The Canadian Lumbermen's Association. There was a real need for a body of this description which could do work along this and other lines. The grading and inspection rules could be also operated by officers of this association.

Uniform grading and inspection would be a protection to the honest trader. The present system allowed loopholes for the men who did not want to give their customers a "square deal." A dealer openly admitted to him that he puts culls into lots of what were supposed to be good timber in the hope that inferior stuff might not be noticed. If it were, it was simply taken out and excuse made, and the dealer got the price of culls in any event. In fact such a man had everything to gain and nothing to lose under such a transaction. The present variation of grades allowed, said Mr Duncan, such men to practice their tricks with more safety than if there were a uniform system of grading.

In a large yard it was now impossible for all lumber to be inspected, with the result that shipments which were not up to the quality expected were allowed to pass and were not discovered until the buyer had occasion to look over the lot. If the grades were more strictly classified, it would make buyers more careful because the rules would prevent them from availing themselves of the present lack of uniformity. There were many men in the trade, middlemen mostly, who had very little practical knowledge of the business and uniform grading would be a great assistance to them, particularly, as if the rules were more clearly defined, it would do away with many of the disputes from the buying and selling ends.

The inspection bureau appealed to him as being an efficient method of settling any such matters which might arise in the course of business.

Impossible and Impracticable

"Impossible and impracticable" is the opinion of Alderman Grafftey, managing director of the Montreal Lumber Company, and president of the Montreal Lumber Association of the proposal for uniform grading and inspection of lumber. "The question of grading lumber covering a large territory presents some difficulties that at first sight would not appear. To have a uniform system of grading controlled by regular appointed officials seems to me to be impracticable, simply because it is unworkable. It would require a small army of men moving about from one point to another, and never on the spot exactly at the time required, and their decisions would be final whether seller and purchaser agreed to them or not. This question has long been a vexed one, and the rapid changes being made in the location of material owing to the timber limits being used up, and new firms coming into operation who work out their own policy, make it very difficult to arrange a uniform grading for the sake of the trade. Take one practical illustration. The product of a large growth of pine log could not possibly be graded similar to the product of a small growth of pine. Perhaps in the same location only a few miles apart. The same applies to spruce, where one limit products a black knotted spruce, whereas in some other locality the product would be far superior.

"The fairness of dealers and manufacturers one towards the other by not making mountains out of mole hills and the elimination from the selling (which is the most important part of the trade) of inexperienced and irresponsible salesmen would do more to regulate present conditions than any attempt to have a uniform grading. There is this further point. Certain terms are used to represent certain grades of lumber, and these terms, used with care and strictly adhered to, are, I think, a sufficient guide for the usual run of trade. It is the usage of terms made to suit some individual cases that works the confusion which admittedly prevails. These terms are made for convenience at a given time, and they afterwards prove inconvenient to all concerned."

Considers Inspection Bureau Unworkable

Mr. W. T. Mason, of Mason & Gordon, Montreal, made the following statement to a representative of the Canada Lumberman:—

"The question of the formation of a set of rules to provide for the uniform grading of the different kinds of lumber manufactured throughout Eastern Canada, but having special reference to the grading of white pine, is one that has had considerable attention from the lumbermen of the different sections of the country for a great many years, but so far without any results worth speaking about having been achieved.

"Speaking of conditions in the Ottawa Valley, the lumber there is manufactured for the English and Eastern States markets, and the grades are entirely different from those in use in the Georgian Bay district, where the lumber is graded to suit the Tonowanda market. The grades in the two districts are different not only in names but in the qualities and other conditions.

"I do not know to what extent these western mills make their grades uniform, but, in the Ottawa Valley, each manufacturer, while making grades of the same name, is a law to himself as to what constitutes lumber of a certain grade, and the trade knows what to expect when buying any certain grades from any certain millman.

"Experience with the grading rules of yellow pine and hardwood timber and lumber, which have been as carefully drawn up as is possible, and which cover every point that either the buyer or the seller could think of, have shown me that it is not possible for such rules to be so drawn as to prevent disputes, and, when disputes do occur, they usually have to be settled by concessions from either one or both parties to the dispute.

"I do not believe that it is possible to draw up grading rules perfect enough to eliminate the personalities of the inspector, and, as no two men are constituted alike, it is not possible to put any two men that I have ever known on to the same lot of timber or lumber and get the same results from their grading. If they get within five per cent. of one another they are doing good work, and I have known cases, many of them, where the shipping and receiving inspectors have been ten per cent., fifteen per cent., and, in some cases, more than this, apart; and, where the official or supervising inspector has been called in, he has, at best, only been able to make a compromise decision. This fact is so well understood by the trade in general that some of the largest and strictest shippers will allow a difference of seven per cent. in their grading rather than fight the claim.

"My experience, therefore, leads me to believe that the formation of the proposed Board of Supervising Inspectors would not be of any material benefit to the trade in general, and that its formation would only result in a bill of expense to the trade in general, and would add a third party to the disputants, and so add to the troubles of those engaged in the lumber trade, rather than diminish them."

The Forester's Return

I'm back on the job by the singing river,
Far from the town with its money-mad,
Back where the quaking aspens quiver—
And I'm glad.
I'm back to the shack where the trail is winding
'Mid flowers of every scent and hue,
And I felt when I gazed, the hot tears blinding—
Wouldn't you?

I'm back to the creak of the good old saddle,
To the equine friends that never doubt;
Back to the haunts—with canoe and paddle—
Of the trout.
There's work to do, and there's work in plenty,
And we sleep in the open, if fate so wills,
But no man is more than one-and-twenty
In the hills.

Imports of wood and lumber into the United Kingdom for the six months ended June 30th, 1911, were valued at $43,675,976. For the corresponding six months of 1910, the imports were valued at $44,114,302. The exports of wood and lumber for the same periods were valued as follows:—1911, $465,306; 1910, $269,108.

THE SPANISH RIVER BOOM COMPANY

If the many processes which contribute to the conversion of standing timber into the finished product in the form of lumber, as it is bought by the consumer there is no single stage which has about it more interest and more of all that goes further to stir the imagination and interest the mind of the operator or of the public, than the various processes which have to do with the progress of the logs from the woods to the mills. The lumber jack is in his happiest mood when he is hard at work upon the river. The danger and the excitement of the drive are something which appeal to the instincts of the lumberjack in a manner which nothing else can approach. Of all the operations upon the river there is none which combines more of these elements of attraction than that which has to do with the sorting of the logs at the mouth of a large river.

It so happens, in connection with the operations on many of the large rivers, that the logs of a number of companies operating on timber berths adjacent to the river, all reach the mouth together and form into a huge jam. So intricate and so dense is the jam in most cases that to the mind of the inexperienced onlooker they are hopelessly mixed, and complete loss seems inevitable. There is little in the way of handling logs in the water however, which daunts the lumberjack and such a jam is one of his ordinary experiences. System and science have been put to use to such an extent in this direction that nowadays a jam of this nature is produced purposely, and the sorting of the logs is attended to by a company which occupies itself with nothing else the year round, and which undertakes to deliver the logs sorted out, in bag booms at the mouth of the river, ready for their various owners to tow away to the mills.

One of the best known of these companies in Ontario is the Sable and Spanish Boom Company, which was organized for the purpose of handling the logs of the various companies which operate upon the Spanish River. The Spanish River empties into Georgian Bay near the middle of the North Shore. The Spanish River Driving Company, a separate company, takes charge of the logs after their owners have placed them in the river in the spring. A number of improvements have been constructed upon the river to facilitate the passage of the logs to the mouth. Also a number of important timber slides have been erected at points on the river where dangerous falls and rapids occur, which would destroy the logs if they were allowed to pass through the boiling waters. The chief of these improvements are the slides at Espanola and Turpine. Improvements have also been made on the Sable and other rivers which are tributary to the Spanish. Among these tributary rivers which add their quota of logs to the immense Spring drive are, the Onaping River, which empties into the Vermillion River, and the Sable River which empties into the Spanish at Massey; to say nothing of a great number of smaller rivers and creeks. Logs for the Sable and Spanish Boom Company to sort at the mouth of the river come from as far north as the country beyond the main line of the C. P. R., a distance of over 100 miles. Throughout all this country the shores of the rivers and streams are dotted with camps both large and small in which live the driving crews of hardy rivermen who keep the logs continually on the move until they reach the jam at the mouth. On the main drive of the Spanish River there are employed about 150 men, and at the various dangerous spots on the river, crews are located whose duty it is to see that the logs do not jam, but are kept moving down stream. At some of the particularly dangerous places in the river the crews employed are of considerable size and the men have to be the most skilful that can be found.

The Sable and Spanish Boom Company in its present form is the result of evolution more than of any definite original plan. In the early years of its existence it was comparatively a small affair. Its size grew with the increasing proportions of the lumbering operations upon the river. Some thirty years ago the first booms were constructed and at that time only a few companies were interested in the work. More booms have been added from year to year until at the present time the plant, including booms, chains, tugs, and buildings, represents an outlay of capital in the neighborhood of $90,000. During its first year's operations the boom looked after the logs of only two companies. At present there are about 25 companies whose logs are handled by it annually.

Since its first appearance the company has been reorganized several times. To-day the following companies, among others,

Dam at Turbine on Spanish River.

Logs above the Dam at Turbine.

The Main Channel—Spanish Boom Sorting Jack.

The "Alligator" is an Important Factor.

have logs coming down the Spanish River and many of them are interested in the company, as owners of stock:—The Serpent River Logging Company, Massey; The Lovering Lumber Company, Toronto; Graves Bigwood and Company, Byng Inlet; The Carney Lumber Company, Owen Sound; The Spanish River Lumber Company, Massey; Loveland and Stone, Cutler; Cutler Bay Logging Company, Cutler; The Hope Lumber Company, Thessalon; The White Pine Lumber Company, Blind River; Moore and Moulthrop, John Island; McFadden and Malloy, Webbwood Booth and Shannon, Biscotasing; P. Shannon and Company, Massey; The Massey Lumber Company, Massey, and the Wolverine Cedar and Lumber Company, Sault Ste. Marie, Ont.

In the history of the company a few facts stand out prominently. In the first place the old Sable and Spanish Boom Company was established by Mr. Arnold of Albany, who was one of the first of the citizens of the United States to build a sawmill of any kind in Canada. His successor was Peter Heisordt of Bay City, Mich., who was followed by Robert Harvey of Bay City. Mr. Harvey continued in control of the company for nine years as Superintendent and Manager, and was succeeded by Abe Wall, of Saginaw, who continued at the work for one season only. Mr. J. O. Smith of Bay City, who is now associated with the Spanish Mills Company, succeeded Mr. Wall, and was himself succeeded by Mr. J. A. Ferguson of Massey, Ont., who now occupies the position of Woods Superintendent for the Spanish River Lumber Company. After this, a broken season followed during which several managers were successively in charge, including Messrs. Bruce, Ed. Williams and Oliver Paquette of Nairn, Ont. In 1908 Mr. C. H. Williams the present Superintendent, took charge. In 1908 No. 2 camp and jack were constructed and the capacity of the plant was increased 40 per cent. The plant of the company consists not only of the booms and camp houses, but they have an excellent dock alongside of which there is plenty of deep water, three tugs, an alligator warping tug, and a pile driver. They have also recently constructed a sling for raising tugs when repairs are necessary. The fuel for the powerful tugs which are employed is of necessity coal, and the company have a large coal dock for receiving the fuel.

So much for the business end of this unique company. The actual operations of the company however, are of far more interest to the general reader. With the passage of the logs down the river, we have nothing to do at present. After the logs have arrived at the mouth of the river, the Boom Company have them in charge and then commences the work of sorting and delivering them to their various owners. Any one who would like to make a special study of "system" as applied to an apparently impossible proposition and worked out to the minutest success, will find here, the most valuable object lesson he could come across in a life time.

It is not many days after the logs commence to come down the river before they collect in a formidable looking jam. By the time the driving season is a few weeks old, the river near its mouth is covered with a mass of logs and were it not for a channel which is kept free, there would not be a square inch of water to be seen from one hrore to the other, for a distance stretching away up the river as far as the eye can see.

At the lower end of the jam, men are stationed with their pike poles and other instruments of power, to free the logs from the jam and send them down one at a time to where they will be handled by the sorters who work from dawn till dark upon the sorting booms. Stout boom timbers are located in the river from the foot of the jam to the head of the sorting jacks. These booms converge gradually and the logs as they reach the jack, borne along by the current of the river, are so directed by men standing upon the floating boom timbers that they come into the long central channel of the sorting jack sideways, or corduroy fashion, so to speak. When the wind is favorable and the men are working with a will, the logs come along one after the other, with only a few inches of water between them, and they pass along quite rapidly.

The men engaged in sorting stand in a row on either side of the central channel of the jack. Their footing is a platform of a

Drawing Logs from Main Channel to pockets.

As much at home as on dry land.

couple of heavy timbers floating lengthwise and pointing up and down stream. Upon this platform, looking from a distance like so many sea gulls upon a floating log, the men stand all day long. With keen eyes and muscles of steel they attend to their work, shooting out their long pike poles every few seconds to capture the logs belonging to the particular company whose logs they are each assigned to look after. To enable them to identify the logs, every operator when the logs are cut in the winter, marks the ends of them with the company's mark of identification. Some of the marks are struck upon the ends of the logs with special hammers made for the purpose. Most of the operators however, have adopted a definite mark, which is painted upon the end of the log in strongly colored paint rendering the work of identification comparatively a simple matter. From the central channel of the jack, openings over which an elevated platform is erected, lead to other channels down which the logs float till they reach the end, out in the harbor at the mouth of the river. There the logs are collected into large bag booms and towed away by tugs belonging to the companies which own them. Briefly speaking, this is the whole process of sorting, and simple enough as it seems, it is a work which requires the utmost skill and minutest attention to detail, if it is to be carried out with success. An idea of the extent of the work may be obtained from the fact that no less that 150,000,000 feet of timber are handled by the sorting jacks in one season. This amounts to about three million or three and a half million logs. In a single day the men at No. 1 jack will sort 30,000 logs. If the wind is favorable—which is seldom the case—they will sort more than this, and on a day when the wind is up stream they will not be able to handle quite so many. Some days, as many as 38,000 logs have been sorted between daylight and dusk. Generally speaking an average day's work at No. 1 jack is about 28,000 logs and at No. 2 jack about 22,000 logs. The pockets into which the sorted logs are collected will hold from 3,000 to 5,000 logs each. A bag boom in which they are towed away to the mills will contain from 1,000,000 to 3,000,000 feet of timber or from 20,000 to 60,000 logs. On No. 1 jack there are 165 men employed and on No. 2, 110 men, making a total of 275 men. The river divides near the mouth into two branches and on each of these is located one of the jacks.

Where 165 men are fed four times a day.

The small army of men engaged in the work have to be fed, housed and cared for during the whole rafting season which lasts from May 1st to Sept. 1st. The men work, what is known as a river driver's day, which lasts, roughly speaking, from 5 o'clock in the morning till 8 o'clock at night. It is an absolute necessity that they should stick to the task through these long hours if the millions of logs coming down the river are to be sorted and delivered during the season.

It will be readily understood that men who are engaged in such arduous work, in the open air all day long and in every description of weather, must be given something more substantial in the way of food than would satisfy men in ordinary occupations. Three meals a day would not suffice to sustain them. Four meals every day are served to them, and they are not meals such as an ordinary man understands the word. The appetites of these men are cavernous. They sit in long rows before tables which are covered with food, and the difference they make in the appearance of the tables in a few minutes is astonishing. Dyspepsia is not known to them. They eat whatever their appetite fancies and give it never a second thought. Pies and pastry, puddings and fresh bread, beef, fat pork and syrup, canned vegetables and cheese, sauces and pickles, tea and coffee 100 per cent. strong, porridge and preserves; every conceivable combination and permutation of the thousand and one articles which make up a camp table, are consumed by them with the haughtiest indifference as to results and with a smack and a gusto which, if it could be illustrated, would establish the fortune of any prepared breakfast food advertiser.

The mainspring of the institution is the cooking staff. They feed them all, nearly 300 of them. They see that the men are awakened in the morning early, and after they are all snoring heavily in their bunks at night, they and their helpers are still busy cleaning up dishes and pots, and setting the table for the early morning breakfast.

At four o'clock in the morning the cooks' big hand bells are heard as they tramp about the camps swinging them lustily and rousing the whole institution from sleep. At half-past four the attack upon the tables is made, and at five o'clock the men are out upon the river, hard at work. It is something worth while, to see the men as they march out along the floating boom platform to their places on the river. There is only room for them to walk in single file. A hundred and sixty or seventy men trudging along in single file, dressed in the picturesque and varied costume of the lumberjack, with the river beneath them and the distant shore for background form a procession more striking and more replete with human interest than the most gorgeous cavalcade of a modern circus. Each member of the procession is a human being intent upon his life work. He is earning money for those whom he has left at home. He is a denizen of the backwoods, a man who would not long stand for a life in the city. He must have the open air and the wild spaces of the north. He tramps along almost in silence. Marching in single file affords little opportunity for conversation. He smokes his pipe or chews his plug as he moves along. There is no hurry, no delay. If his time were taken, day after day, on the march of about 300 yards from the camps to the jacks, it would be found that there was almost no variation in it. He is methodical and picturesque and a study in human nature which it would be hard to equal.

When he has reached the sorting jacks he is almost in a moment another being. The steadily moving stream of logs awakens in him an instinct and a personality which at first had seemed to be absent. His tongue is loosened and his companionability appears. The men work in groups which perhaps would not be noticed at first, but they are pretty well marked. A group of French Canadians will be found near one another. Several Scotchmen will be in another quarter, and the foreigners will be found assigned to sections of the work which bring them together. Through the long hours they work away at their tasks of allotting the logs to their proper pockets.

These men of the river have a vocabulary which serves them best when there are jibes to be cast or when there are mistakes to be jeered at. There is nothing in the form of an oath which is beyond the ken of most of them, and when they are aroused to language of this nature it is something to make a man marvel at the flexibility of the human tongue. Possibly a log or two which should have been secured by a couple of men up stream escapes their notice and is detected by others after it has passed beyond its proper pocket. In a moment one hears the call, "Serpent going up," or "Spanish going up," according to the designation of the logs which have been missed. The logs are turned, pointing up stream, and shoved along by pike poles until they reach the men who have missed them. Meanwhile a volume of jibes or curses is heard from some of those upon whom is put the duty of turning the logs back and returning them to their proper places. Such sarcasm, disdain and cursing as one may hear when this occurs, is not to be described. It is about the only diversion the men have and they indulge in it without stint.

These men working upon the river with the running logs become as agile upon the floating log, or a wobbling timber platform, as an ordinary man upon a country road. They leap upon a log to cross the channel of the jack, with less concern than other men would show in stepping from a street car.

The pockets into which the logs are directed are divided from one another only by single floating boom timber logs, chained together at the ends and anchored every here and there to spiles driven for the purpose. They extend for a distance of half a mile or more out into the river where, on a windy day, the waters are rough and the logs dance about pretty vigorously.

From five o'clock in the morning until quarter to nine in the morning the men work steadily. Then they march in for their morning lunch and are again on the river at half-past nine. The work then continues till quarter to three o'clock in the afternoon and at that time an adjournment is made for afternoon lunch. At half-past three they are at work again and stay at it until about eight at night when they return for supper and shortly after this they go to bed. There is not much sitting up late to read or play cards. The morrow's work is too hard and it begins too early for any one who sits up late at night to stick at it.

The cooking and the setting of the tables for all these men is a tremendous business. The cooks have to be experts. They have assistants known as the second cooks and several helpers. This staff of men prepare all the food, set all the tables four times every day, clean all the utensils and dishes and attend to the innumerable chores which have to be systematically looked after. There are many articles of necessity which a lumberjack needs during the driving season. The superintendent of the company keeps a supply of these, which he deals out to the men when they are required, the price being deducted from the men's wages. Tobacco, boots, wearing apparel and such other requisites as the lumberjack requires are kept in this stock, and it is the duty of the bookkeeper to see that they are properly charged up. The bookkeeper, Mr. J. Parker Reid, has his quarters with Mr. Williams, the Superintendent, in a comfortable office building, with living rooms attached.

Smaller sorting booms similar to the Spanish River Boom, are in operation at other points on the Georgian Bay, but in comparison, they are small affairs. One of these is on the Mississaga River about three miles from Blind River and it sorts logs for four or five different companies. On the Blind River, a boom sorting five or six marks is located and on the French River a boom company sorts logs belonging to several of the companies operating in that district.

There remains only to explain the financial system upon which the Sable & Spanish Boom Company is conducted. The company is an organization formed by a number of the companies which operate in the country bordering on the Spanish River and its tributaries. No attempt is made to derive a profit from the company's operations. A fixed charge is made per thousand feet for handling the logs. If a surplus is available at the end of the year, it may be divided or expended in alterations and improvements, and if continual surplusses were made they would result in the charges being reduced. This has not been the case in the past, however and the company gets along pretty well on just about an even keel.

The wages of the men who work at the sorting jacks are from $1.75 to $2.00 per day in addition to their board and lodging. The wages of the tug men and cooks are higher, running from $70 to $100 per month.

The officers of the Sable and Spanish River Boom Company are as follows:—President, Guy H. Moulthrop; Sec.-treas., W. J. Bell; Executive Board, Guy H. Moulthrop, W. J. Bell and John Malloy.

A Progressive Ontario Lumber Firm

Hocken Lumber Company's Operations at Otter Lake Station —Product Dressed and Planed as it Leaves the Saw

At Otter Lake Station in the Parry Sound, District of Ontario, is located the mills of the Hocken Lumber Company, Limited, at the junction of the G. T. R., C. P. R., and C. N. O. R.

The location of a mill always has much to do with its success. The excellent site of the Hocken Lumber Company, and the energetic oversight of its president and general manager, Mr. N. C. Hocken, account largely for the success of the company.

Mr. Hocken started a small mill at Otter Lake in 1903, and the business gradually extended until, in 1907, a joint stock company was formed. In 1909 fire destroyed the plant. Although there was no insurance upon it, a new mill was erected upon the same site within eight weeks.

The present sawmill is fitted with a circular saw, steam feed, steam nigger and steam log stop, 150 h.p. The planing mill has a new Berlin 94 planer, also a Ballantyne Lightning Matcher. All lumber is dressed and planed as it leaves the saw. The company specialize in timber, all of which is loaded direct from the saw on to the car. The total cut averages about 6,000,000 feet yearly.

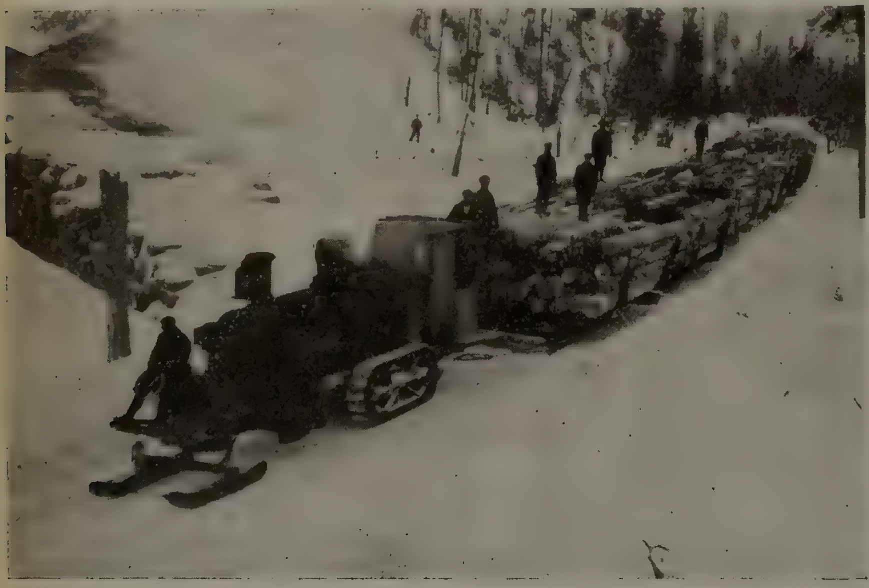
The president of the company, Mr. N. C. Hocken, was born in Bowmanville, Ont., thirty-three years ago. Although a comparatively young man, Mr. Hocken has, by his constant and careful application to business, made a success in the lumber industry. Not only in the office, but in the mill and in the woods, he always maintains a constant oversight, and through his systematic attention to all the operations, the cost of production has been greately reduced. The other members of the company are Henry Hocken, vice-president, father of the president, and a lumberman of many years experience; H. N. Hocken, secretary-treasurer; S. L. Hocken, Mr. J. C. Slater and J. W. Slater. The company also maintain a large supply store at Otter Lake Station, in charge of Mr. James Slater.

Plant of the Hocken Lumber Company, Limited, Otter Lake Station, Ont.

Logging by Steam in Ontario Forests

Interesting Operations of the Wolverine Cedar and Lumber Company on their North Shore Limits—Haul 2,400 Logs a Day

As other industries have been improved and their costs lessened by the gradual substitution of steam and electric power for horse and man power, and of various mechanical devices for manual labor, lumbermen have been constantly trying to apply the same principles to their own industry. This has been done pretty successfully in the saw mill end of the business, and in a modern sawmill with its steam kickers, niggers, loaders, cant flippers, live rolls, etc., the logs and lumber are rarely touched by hand except in guiding them. In the logging end of the business, however, comparatively little has been successfully accomplished in this direction, particularly in Ontario, where the ground is rough and the stand of timber not sufficiently heavy to justify many devices used successfully elsewhere. It is in the logging end of the business, however, that labor saving mechanical devices have their greatest opportunity for reducing costs, as the cost of logging is several times the cost of sawing.



Logging by Steam—Going down a Small Grade.

Logging is primarily a problem in transportation—from the stump to the skidway, the skidway to the stream or the railway, and thence to the mill—and though there are other expenses, the greatest saving that can be made in the cost of logging is in the various processes of transportation. The steam log hauler attempts to cheapen just one of these processes, viz: the transportation of the logs from the skidways to either the railway or the river. It is not a panacea for all the troubles of the logging business, but simply a substitution of a machine and a few men for larger number of men and a number of horses, on the sleigh haul. It is a mean between the high cost of preparation and low cost of operation of a logging railroad, and the low cost of preparation and the relatively high cost of operation of sleigh hauling with horses. Where a logging railway can be cheaply constructed and has a heavy enough stand of timber available to justify the initial cost, we believe it makes cheaper logging than the steam log hauler, particularly as it can be used the year round. On the other hand, there are some conditions, such as a very short haul, a rough country or lakes, where a sleigh haul with horses is cheaper than either. The conditions favoring the steam hauler, which is substantially a railroad proposition on ice instead of steel, are a moderately long haul and an up hill grade, as against horses, and too little timber and too great expense of grading, taking in and laying steel, as against a logging railroad.

The machine we used, as you will notice from the photographs, is practically a small geared locomotive, built for running on snow or ice instead of on rails. The boiler is 36 in. by 15 ft. of regular locomotive type, with a fire box that will burn either wood or coal. We found coal cheaper than wood. The engine consists of four cylinders, each 6¼-in. bore by 8-in stroke, bolted in pairs to the boiler and frame on each side, and each pair equipped with link motion. The machine carries 200 lbs. steam pressure and develops about 100 h.p.

From the crank shafts driven by cylinders, power is transmitted through a longitudinal shaft and a set of gears to the driving wheels, which are sprocketed, two on each side of the machine, each pair carrying a lag or tread chain 12 in. wide, with a bearing surface on the road about four feet long. The bearing surface of the lag chains between the two sprocket wheels is kept flat on the road by a channel carrying a second chain belt which is simply a series of roller bearings. Most of the weight of the engine is carried on these driving chains at the rear, the remainder of it being carried on a pair of runners in front, which are steered by a wheel. Under the boiler the engine carries a water tank holding enough water to run the machine five or six miles. This is filled through a suction hose by a steam syphon.

The manufacturers of the machine claim that about one to one and a half tons of coal should run the machine ten hours. This possibly is correct under the most favorable conditions, but we found that it required on an average about half a ton more than this.

There is not very much variation in the speed of the machine loaded and light. The maximum variation for satisfactory use being from about four and a half miles an hour with a train load of logs, to about six miles an hour with a train load of empties.

With the machine we used special heavy sleighs with eight foot run and fourteen foot bunks. The run is so wide in order that the engine may keep inside of the ruts. Each sleigh has a short heavy tongue, which in coupling the sleighs in trains is adjusted to bump against the beam of the sleigh in front, to prevent their running together. The short tongue however, has a double clevice for taking long poles for use in assembling the loads with horses, and a hook to which the draft chains can be attached. In coupling the sleighs in a train each sleigh is coupled to the one in front by cross chains on the same principle as the two sets of runners are coupled together in a horse sleigh. The front sleigh in the train is coupled to the engine by cross chains attached to each side of a slot in the draw box of the engine, the tongue fitting into the slot. The cross chains all the way through however, instead of being fastened to the runners are fastened to the beams, and the gudgeon pins pass through a long link in the cross chains so that no traction strain comes upon them. The sleighs were equipped for convenience in loading and unloading, with stakes fitting into the steel pockets at the ends of the bunks. The pockets on each side of each sleigh can be tripped by a toggle lever allowing the stakes to drop out and the load to dump. This equipment was used in place of corner bind and wrapper chains and saved considerable time, but is not essential to the working of the machine. We used about thirty-five of these sleighs.

Logging by Steam—Making up a Train with Horses.

In building our roads, we plowed them to the ground and tanked entirely with horses, building up about six inches of ice before we started to haul and then adding to it for a couple of weeks until we got about ten inches. We cut ruts about four inches deep to keep the sleighs in the road. After the road had once been tanked it required very little attention, in fact simply the plowing out after each heavy snow storm. The machine does not cut up the road as horses do, and is not bothered by a flurry of snow which leaves a couple of inches of loose snow in the ruts. After getting about ten inches of ice we did not put another tank of water on this road, although a horse road, paralleling it part of the way, required tanking almost every day. We of course tried to get the roads as level as possible, but did not have to be so particular about short grades as for horses, as the machine is a good climber and it not bothered at all by a stiff grade the length of half its train, which a team of horses with a fair load can not get up without assistance. The principal difficulty we had with the machine was going down hill, as it is considerably harder to sand properly for ten or twelve sleighs than for one, and in case of a "run" the machine cannot keep out of the way so well as horses, being geared for heavy pulling and not for speed. It is easy, of course, to sand a hill heavily and take down only two or three sleighs at a time, but that takes longer. In planning a road it is necessary to have water holes every four or five miles as the machine will require water that frequently if heavily loaded.

As it is more expensive to make roads for these wide heavy sleighs than for the ordinary type of horse sleighs, we made rather fewer branches and skidded our logs a little farther. We did not find this made any material difference in the cost, as we had fewer skidways to build when we were skidding, and fewer to shovel out when we got to hauling, though in loading there was a little more tailing down. In operating the machine we kept three trains of ten or twelve sleighs each, in use all the time; one train in the branches being loaded, another train at the dump being unloaded, and the third train behind the machine. In this way we saved a great deal of time for the engine as it did not have to wait for its loads or empties. We loaded in two or three branches at a time, using at one time as far as possible, branches which came out on the main road about the same place. The loads were drawn out of the branches and made up into trains with horses, frequently two or three teams being required to bring a load out of a bad branch, when we got to loading our sleighs heavily.

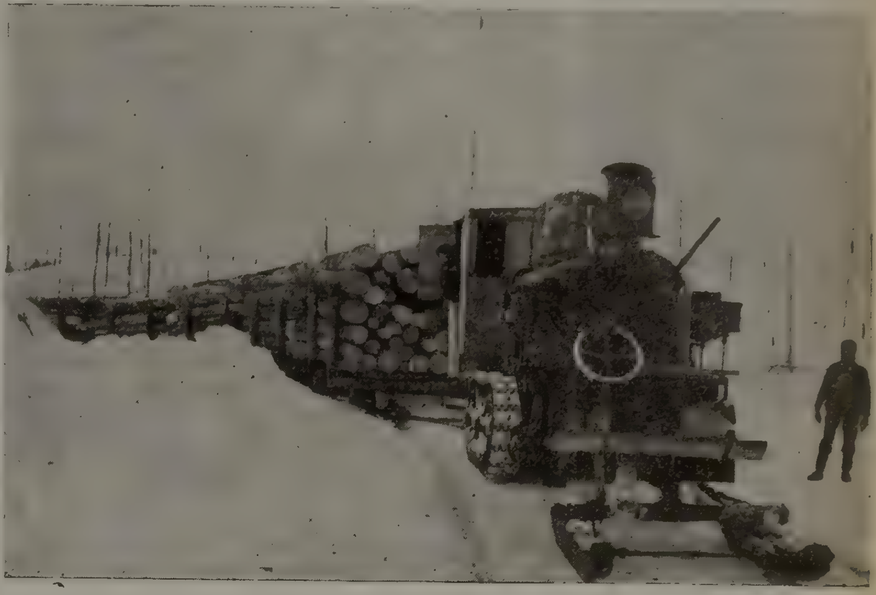
When the engine got in it dropped its train of empty sleighs on a siding, hooked on to the loaded train and started for the landing again, and the horses which had brought out the loads and made up the train took the empty sleighs to the skidways to be re-loaded. At the landing the idea is to have the machine spot the whole train where it can be unloaded and pick up the train load of empty sleighs, which, as fast as they were unloaded, had been turned around and coupled up by a team or so of horses. In this way it is possible to operate the machine with very little lost time.

Operating in this way, after we got well started, we made three trips a day on an average haul of between seven and eight miles to the water, or a total distance of about forty-five miles a day, and a good many days we could have made an extra trip if we had had sufficient sleighs to load. We carried from nine to twelve sleighs to the trip, or thirty a day. Each sleigh was loaded inside the stakes to about four feet and a half above the bunks and the load then rounded up, averaging about eighty logs to the load. In other words, the average hauled was about 2,400 logs a day.

Logging by Steam—Loading for the Machine.

During one period when the machine was laid up for a few days we tried to haul with horses, and put our best teams on this road. We could not average eighty logs a day to the team and the horses "went down" very rapidly during the few days we used them. In other words, on a haul of this length the machine is equal to about thirty teams of horses, and as from eight to ten teams are required to bring the loads out of the branches and make up the trains and to switch the empties at the landing, the machine is equivalent, we figure, to about twenty teams net.

It requires a crew of five men, consisting of engineer, fireman, steersman and two trainmen. The engineer's wages run from $100 to $125 a month, and the other four men average about $45 to $50 each. The whole thing will figure about $15 a day in wages and board, as against about $40 for teamsters, and the coal, oil, etc., for the machine will cost another $15 a day, including the toting, as against a cost of $25 to $30 for feeding horses to do the same work. The principal saving, however, comes when the machine is not in use, for our experience has been that it costs us anywhere from $25 to $50 a head to take care of our horses during the spring and summer, and of course no expense whatever is necessary on the machine. Such a machine can also be used night and day for as long a period as desired, which gives it an advantage over horses.



Logging by Steam—Taking a Curve.

We think that the rate of depreciation on it is very much less than on horses, for while some horses will give service in logging for a number of years, a considerable percentage of them either die or get killed or become useless for logging through one cause or another.

Canadian Paper Captures New Zealand Markets

American manufacturers of printing and writing paper have suffered almost a complete loss of their New Zealand business within recent years, writes the United States Vive-Consul General Mr. Henry D. Baker, from Auckland, New Zealand.

Canada, through the preferential surtax on printing paper, which went into effect in April, 1904, has taken from the United States almost the entire business of supplying printing paper for the newspapers of New Zealand. Up to that time printing paper had been admitted free of duty into New Zealand, but the preferential tariff, which amounted to 20 per cent. ad valorem, raised an effective bar against the admission of American paper in competition with paper from British countries, which was still admitted free.

The complete loss of this business to the United States is shown by the fact that in 1903, the year before the preference went into effect, the Eastern States of the United States, exported to New Zealand 46,823 hundred-weight of paper and the Western States 11,630 hundred weight, a total of 58,453 hundred-weight, while in 1909, the last year for which customs figures are available, the Eastern States of the United States exported only 3,913 hundredweight, and there were no exports from the Western States. Canada, however, which in 1903 exported 2,231 hundredweight of printing paper to New Zealand, in 1909 exported 86,889 hundred-weight. Printing paper is to-day Canada's most profitable article of export to New Zealand, the sales in 1909 amounting to $286,286, while sales from the United States amounted to $12,692.

The report of the Canadian Forestry Convention at Quebec has just been issued, and makes a volume of 160 pages, of addresses, papers, and discussions by Canadian and United States authorities on forestry and lumbering. All parts of Canada are embraced in the report, and all phases of the subject, commercial, educational, administrative, and protective are dealt with. The resolutions passed and changes suggested in the laws are included. Persons interested may receive a copy free upon application to The Secretary, Canadian Forestry Association, Canadian Building, Ottawa, Canada.

The Value of Canadian Forest Products

Nearly Three Billion Feet of Lumber, Lath and Shingles Cut Annually—Total Value of Forest Products, $166,000,000

By H. R. MacMillan

H. R. MacMillan

The statistical work conducted by the Forestry Branch of the Department of the Interior, Ottawa, during the past three years, has enabled us, for the first time, to form an authorative estimate of the quantity and value of the annual forest products of Canada.

The quantities given in Table 1 represent the amounts of timber cut—the woods to furnish the material necessary for each class of products. Owing to the very great waste in the utilization of wood in Canada only about three-fifths of this wood was ever actually put into use.

The values given in Table 1 are the values of each class of products at the point of manufacture. Were the timber products of Canada to be traced to their highest manufactured form their total value would greatly exceed the $166,000,000 given here over one-quarter of the total and the remaining one-quarter is made up of nine different classes of products, of which posts, poles and rails, and pulpwood are the most important.

The quantity of timber cut and its value at the point of production for each of the classes of forest produce for 1909 is given in Table 1. The figures for quantity and value have been rounded off to millions.

Table 1

The Cubic Feet of Forest Material Required for, and the Total Value of, the Forest Products of Canada, 1910

Products	Cubic feet of Material cut in the forest	Value
Total	2,895,000,000	166,000,000
Lumber, Lath and Shingles	840,000,000	87,500,000
Firewood	1,430,000,000	45,000,000
Poles, Posts, Rails	280,000,000	11,000,000
Pulpwood	150,000,000	10,000,000
Hewed Ties	125,000,000	5,000,000
Cooperage	29,000,000	2,500,000
Round Logs Exported	20,000,000	1,000,000
Round Mining Timber	20,000,000	1,000,000
Square Timber	3,000,000	1,000,000
Tanning Materials		1,000,000
Miscellaneous Products*...	10,000,000	1,000,000

*Distillation wood, maple sugar and syrup.

About 2,895,000,000 cubic feet of wood are cut annually in the forests of Canada. One-half of this is used for firewood, three-tenths for lumber and shingles, one-tenth for poles, posts and rails. These three classes of products together require nine-tenths of the wood cut in this country.

The total value, at the point of production, of the annual forest products of Canada is at least $166,000,000. This is $22.44 for every person in Canada, March 31st, 1909. In 1909 there were cut from Canadian forests about 400 cubic feet of timber for every inhabitant of the country. This is a per capita timber usage unequalled by that of any of the other important countries in the world.

The different classes of forest products will be discussed here in the order of their importance.

Lumber, Lath and Shingles

Lumber is Canada's most valuable forest product. There were cut in 1909 about 4,900,000,000 board feet of lumber worth at the mill $80,700,000. Twenty different species make up this total, only six of which, spruce, white pine, Douglas fir, hemlock, cedar and red pine, reach a cut of over one hundred million per year. These six species constitute 86.5 per cent. of the total lumber production of Canada.

Spruce, which has been the leader this last two or three years, in 1909 formed 29.5 per cent. of the total, white pine 27.4 per cent., Douglas fir 12.3 per cent., hemlock 7.9 per cent., and red pine 4.4 per cent.

Soft woods constituted about 94 per cent. of the lumber cut in 1909, compared with 6 per cent. supplied by hardwoods. The only Canadian hardwoods, of which over 20,000,000 feet are cut per year, are birch, maple, basswood and elm.

The valuable hardwoods, oak, hickory and walnut, are almost extinct in Canada. The total cut of these three species in 1909 was less than one-fifth as great as the quantities of these necessary woods imported in that year from the United States.

Two-fifths of the lumber of Canada is produced in Ontario, one-fifth in British Columbia, and one-fifth in Quebec; New Brunswick and Nova Scotia together make up the greater part of the remaining fifth, and proportionately small quantities are manufactured in Saskatchewan, Manitoba, Alberta and Prince Edward Island.

The per capita lumber production in Canada in 1909 was about 684 board feet, probably the greatest in the world. The per capita production in the United States in 1907 was 470 board feet. It is probable that with an increased demand due to forest depletion in other countries, and with the development of transportation systems to northern forest regions, now inaccessible, the forest production of Canada will still further increase, even though it has already reached proportions which under present systems of administration the forest of this country cannot permanently support.

There were manufactured in 1909 about 965,000,000 lath, worth about $2,400,000. About one-half the lath manufactured were spruce and one-third were white pine; cedar, Douglas fir and hemlock made up the remainder. For every 3,000 to 4,000 feet of lumber milled there are produced enough slabs and edgings to make 1,000 lath. It is from this material, at present considered valueless for any other purposes, that practically all the lath produced in Canada is manufactured.

About 2,330,000,000 shingles, worth $4,400,000, were manufactured in 1909. Cedar is the favorite shingle wood; three-quarters of the shingles manufactured in Canada are of red cedar—the production being about equally divided between the red cedar of British Columbia and the white cedar of Ontario, Quebec and New Brunswick. Spruce and white pine are the only other species used to any extent for shingles; together with cedar they make up 98 per cent. of the total output. The western white pine (Pinus monticola), of British Columbia, supplies three-quarters of the white pine shingles of Canada.

As nearly as can be judged almost as much cedar is used for shingles in this country as is sawn for other products.

Two-fifths of the shingles manufactured are produced in British Columbia, almost one-fifth in Quebec, the remaining two-fifths are supplied chiefly by New Brunswick and Ontario.

It is estimated that in addition to the sawmill waste used for fuel, about 15,000,000 cords of firewood, valued at $45,000,000, are consumed yearly in Canada. The use of wood for domestic fuel is general in the country, excepting in the areas tributary to the eastern and western coal fields, the comparatively small prairie district, where there is no timber, the denuded area of Southwestern Ontario, and a few of the larger cities. Much, if not most, of the firewood used comes from the uncleared portions of farms in Eastern Canada, and a fairly large proportion of it consists of hardwood timber which would be worth much more if manufactured into lumber or other products.

All the common woods are used for fuel, but the species used to the greatest extent are maple, birch, beech and spruce, in Eastern Canada; tamarac, jackpine, spruce and poplar in Central Canada. and Douglas fir on the Pacific Coast.

Poles, Posts and Rails

There are used each year about 400,000 poles over twenty feet in length, and about 110,000,000 posts and rails of a total value of $11,000,000.

For the poles, which constitute the chief means of support for the transmission lines maintained by the telephone, telegraph, railroad and electric companies, cedar is practically the only native timber suitable. Nearly 95 per cent. of the poles used in Canada in 1909 were cedar, mostly eastern white cedar. The remainder were tamarac, spruce and Douglas fir.

Wherever cedar is available it is also the favorite timber for posts and poles, as it is the only common Canadian wood durable in contact with the soil. Chestnut and oak are valuable for post timbers, but are native to only a small area in Canada, and are almost extinct. Posts and rails are usually secured as near as possible to the locality where they can be used, and where cedar is not available the woods most commonly used are tamarac, spruce, jackpine, lodgepole pine, poplar and Douglas fir.

Pulpwood

The cut of pulpwood for 1909 was nearly 1,700,000 cords, valued at $10,000,000.

Over four-fifths of the pulpwood cut in this country is spruce; spruce and balsam together supply 99 per cent. of the pulpwood. Other species included in the remaining one per cent. are poplar, hemlock and jackpine. Three-fifths as much spruce is cut yearly for pulpwood as is cut for lumber. About 46 per cent. of the pulpwood cut in Canada is domestically manufactured, and about 54 per cent. is exported in the raw form to the pulp mills of the United States. Over one-half of the pulpwood domestically manufactured is manufactured in Quebec, about thirty per cent. in Ontario, fourteen per cent. in New Brunswick and four per cent. in Nova Scotia. Nearly all the pulpwood exported is cut in Quebec. About seventy per cent. of all the pulpwood produced in Canada is cut in Quebec.

The pulpwood which is yearly exported from Canada to the United States keeps running 69 of the 251 pulp mills in the United States. If this pulpwood were manufactured in Canada it would supply each year about 73 mills of the average size of those already existing. We have now 60 pulp mills in Canada. If we manufactured at home all the pulpwood which we cut we would have about 133 pulp mills.

Hewn Railroad Ties

In addition to the sawed ties, reported and classified as lumber which Canadian roads, steam and electric, purchased in 1909, there were purchased 9,500,000 hewn ties, valued at $5,000,000. The species used chiefly for hewn ties are cedar, jackpine, tamarac, hemlock and spruce. The making of hewn ties involves a tremendous waste of timber and leaves a great accumulation of slash in the woods which as a rule results in the destruction of the entire forest by fire.

Cooperage

Two classes of cooperage are manufactured, tight for liquids, and slack for materials other than liquids. Tight cooperage requires a very high quality of wood—white oak is preferred and is used almost exclusively. There is no supply of wood suitable for high grade tight cooperage in Canada, consequently there is practically no tight cooperage industry excepting what depends upon logs or staves imported from the United States, or excepting a low grade of tight cooperage for less penetrating liquids, for which some Canadian woods are suitable. There were manufactured in Canada in 1909, 567,000 sets of light heading and 12,000,000 tight covers. The greater part of the tight cooperage used in Canada is manufactured in the United States, and of the remainder a good proportion is manufactured in Canada of logs imported from the United States.

Most of the woods common to Canada are suitable for the manufacture of different grades of slack cooperage. There were manufactured in Canada in 1909, 139,000,000 slack staves, 11,000,000 sets of slack heading and 47,700,000 hoops. Four-sixths of the staves were elm, one-sixth were spruce, and the remainder chiefly poplar, maple, birch, beech, basswood and ash. About one-quarter of the heading was poplar, one-quarter elm, and the remainder basswood and spruce. Nearly 90 per cent. of the hoops are elm. Over three times as much elm is used for cooperage in this country as is cut for lumber. The total value of the cooperage output for 1909 was $2,500,000.

Logs Exported

Public lands regulations prohibit the export of unmanufactured logs from the greater part of Canada. The logs exported are chiefly cut on private lands in Ontario, Quebec and New Brunswick. At times cedar logs are exported from British Columbia. There were exported in 1909, 20,000,000 cubic feet of logs, valued at $1,000,000. Practically all logs exported go to the United States.

Round Mining Timbers

The operation of the mines of Canada requires the cutting each year of about 20,000,000 cubic feet of round timbers worth about $1,000,000. About eight-ninths of this is used for the coal mines and one-ninth for the metal and other mines. Soft woods form the chief source of supply, and as a rule young thrifty trees are used.

Square Timber

In addition to sawn square timber, which is scaled and reported upon as lumber, about 3,000,000 cubic feet of timber is hewn and exported each year in square or waney logs. Practically all of this timber goes to England; one-half of it is white pine, one-third birch, and the remainder chiefly red pine and elm. The export in 1909 was valued at almost $1,000,000.

The square timber trade reached its height in 1877, and, owing chiefly to the disappearance of the supply of timber fit for squaring, has declined steadily since that date. The average white pine export for the decade 1871-1881 was about fifteen times as great as it was in 1909. The export of oak was then 194 times what it was in 1909. The export of birch has kept up better. It was, in 1909, nearly one-half as great as it was in the seventies. The export of elm has decreased largely. It is now only one-thirteenth as great as it was thirty years ago. The other timbers, red pine, ash and maple, are only exported to about one-tenth the quantity previously shipped.

Tanning Materials

The only native vegetable tanning material in Canada is a forest product, hemlock bark. The value of the hemlock bark and the extract of hemlock bark placed on the market in 1909 was over $1,000,000. About four-fifths of this was used at home, the remainder exported.

Canadian tanneries used in 1909 about 90,000 cords of hemlock bark, and about 2,250,000 pounds of extract of hemlock bark of a total value of over $800,000. At one time tanneries in this country depended almost altogether upon hemlock, but owing to a variety of reasons, the decreasing supply of hemlock, the introduction of cheap foreign, chiefly tropical, vegetable tannins, and the multiplication of chemical processes of tanning, hemlock now represents, by value, about three-fifths of the vegetable tannins used, and a much smaller proportion of all tannins, vegetable and chemical.

There were exported in 1909 about 20,000 cords of bark, worth $120,000, and about 3,500,000 pounds of extract of hemlock bark, valued at $80,000. The bark goes to the United States, the extract to Great Britain. This represents a great decrease from 1880, when the export of bark was 82,000 cords, worth $442,000, and 1883, when there were exported 20,000,000 pounds of extract, valued at $305,000. The exports of tannins from Canada are now less than two-sevenths as great as they were thirty years ago.

All the hemlock bark produced in Canada is not used. Though the bark of the British Columbia hemlock is twice as rich in tannin as that of the eastern hemlock, it is all wasted, and it is estimated that, at prevailing prices, eastern hemlock bark is wasted to the extent of $400,000 yearly.

Miscellaneous Products

In addition to the different classes of products enumerated above, enough material is taken from the forests of Canada each year to make up another $1,000,000.

Nearly 100,000 cords of wood, worth over $300,000, are used yearly by the destructive distillation plants manufacturing wood alcohol, acetate of lime and charcoal. Still more valuable is the maple sugar industry of the eastern provinces.

If the forests of Canada are administered for another three or four decades as they are administered at present it will be impossible for them to produce yearly such crops as that described above. No one can doubt this save those who do not know that our seemingly inexhaustible white pine forest has been so reduced that it now contains only thirty years' supply at the present rate of cutting, that our valuable hardwoods have been cleared away to such an extent that we now import each year more hardwood lumber than we produce domestically, that our square timber exports are only one-twelfth what they were thirty years ago, and that two-thirds of the original forests of Canada have already been destroyed by fires. Under the present system of exploitation the forests of Canada are decreasing steadily in area and in available products.

The decrease of the forest area of Canada, and the consequent decrease in available forest products is nothing short of a national calamity. It is not the purpose here to touch upon the favorable influences which the forest exerts upon climate and waterflow, indirect values which are recognized by everyone, but to point out how indispensable is the forest as a crop producer.

The forests of Canada stand chiefly upon lands unfit for agriculture even in its most intensive form. They produce a crop valued in its raw state at $166,000,000 per year. The harvesting and first manufacture of this crop employs labor to the extent of $100,000,000 yearly, and probably almost as much more is spent in turning out the more highly manufactured forms of wood products. In addittion to supplying a large proportion of the population of Canada with this means of livelihood, the products of the forest are, for the whole population, the chief sources of heat and shelter, are the most important raw materials for the factories, enter largely into the construction of nearly all articles of human use, and furnish one-sixth of the total exports of Canada.

Unless the principles of foresty are adopted by those who are responsible for the administration of the forest lands of Canada there is nothing surer than that within a comparatively short period of years the forests of Canada will be so destroyed by fire and exploitation, heedless of the future, that not only will there be no surplus of forest products for export, but there will be an insufficiency of any grade of timber for the building of homes, the carrying on of the works of the population in this country, and on the mountainous, rocky, sandy and other non-agricultural lands of this country, where the forest stood, there will be produced nothing. All the symptoms which have ever been met with in history previous to the destruction of the forests of any country, now exist and daily increase in Canada.

Forestry seeks not only to prevent the destruction of the forests but to secure their improvement so that they will be in a psition to produce each year, without any lowering of their value, even greater crops than they have yet produced under methods of exploitation. To secure this result forestry must achieve fire protection, prevention of waste in the logging, manufacture and use of lumber, and the reforestation of barren and cut-over lands.

The measures adopted to protect the forests from fire are now generall understood. They are the removal by eduction or legislation, adequately enforced, of the causes of fire, the organization of a patrol to find and extinguish such fires as will inevitably start, and the improvement and organization of the forest areas so as to render most efficient the efforts of fire fighters and to minimize the chances of any fire getting beyond control.

One aim of forestry is to further the productivity of the forests by securing the most profitable use of all forest products. There is now a tremendous waste in the use of forest products, a waste which every year leads to the cutting of more than twice as much timber in the forest as ever comes into use. Investigations have not as yet been conducted in Canada to show what percentage of the merchantable timber cut in the forests is wasted, but in the United States, where conditions of logging, manufacture and utilization are similar to those in Canada, it has been found that from ten to thirty-five per cent. of the merchantable timber is, as a rule, left in the woods; that of the logs which reach the mill there is wasted 49.1 per cent. by volume, and that after the lumber leaves the mill from ten to twenty-five per cent. of it is wasted before it is put into use. The waste in logging is due to:—

Poorly conceived and poorly executed logging plans.

Failure to remove from the woods merchantable material which is actually cut.

Failure to cut and remove inferior trees, partly defective trees, and inferior species which are merchantable.

Failure to remove small bodies of timber in comparatively inaccessible places, on which the profit is low.

The removal of only one class of timber from the forest when others are present and merchantable.

Failure to utilize merchantable dead timber; when inferior trees and inferior species are available, the use for construction work of valuable species and valuable trees which can not be otherwise utilized at a later time; failure to use materials for the purpose to which they are best suited.

The cutting of trees for tan bark only, and waste of logs.

The cutting of unnecessarily high stumps.

Failure to utilize all of the merchantable material in tops suitable for saw timber or cord wood or other use.

Failure in requiring the proper variation in log lengths.

The non-use of odd and short log lengths.

Unnecessarily long trimming lengths.

Unnecessary breakage in felling and transportation.

Too great loss in driving, and

Careless use of logging machinery, such as donkey engines.

All these causes given in the Report of the National Conservation Commission as reasons for the great loss of timber in logging in the United States operate in Canada. On one operation on Dominion lands in the Crow's Nest Valley, Alberta, it has been noticed that the waste of timber per square mile was 366,400 lineal feet of mining props, and 480,000 board feet of saw material, or over ten per cent. of the total originally standing.

On lands under forest management, it has been found possible to reduce the waste due to the causes enumerated above to less than two per cent. There is no loss in preventing this waste, but there is sometimes no profit except the profit which accrues to the country through securing the use of a natural product which would otherwise be lost.

The loss of timber in the manufacture of lumber is partly unavoidable and partly avoidable. The different sources of loss are:—

(a) Loss due to kerf 15.5 per cent.
(b) Loss due to edging and trimming 10 per cent.
(c) Loss due to slabs 10 per cent.
(d) Loss due to careless manufacture and accident 4 per cent.
(e) Loss due to standardizing lengths and widths of boards 2 per cent.

Much of this waste may be averted by:—

1. The general adoption of thin saws—band saws and resaws.
2. By elimination of gang saws.
3. By manufacturing in round-edged or "waney" form a large part of the lumber which is to be worked over.
4. By modifying market requirements and usage so as to allow boards of random widths and odd lengths.
5. By admitting short and narrow boards.
6. By modifying standard grading rules to allow defects on ends and edges without seriously reducing the grade of a board.
7. By more careful manufacture and more perfect machinery.
8. By utilizing short boards, slabs, and waste for such articles as matches, toothpicks, excelsior, novelties, and other purposes for which large boards and planks are now used.

There is great waste of lumber before it is put into use, due to loss in seasoning, and loss in manufacturing. It is estimated that in lumber used by the building trades there is a waste of 3 per cent. in seasoning, due to checks, stains ,etc., and a waste of 12 per cent. in cutting for use. There is a seasoning waste of 5 per cent. and a manufacturing waste of 20 per cent. in the timber used in the furniture industry. There is a waste of 15 per cent. in the timber used in the manufacture of boxes, and a waste of 10 per cent. in timber used by transportation lines. There is an average waste of 10 per cent. in seasoning, and of 15 per cent. in manufacturing vehicle parts. Much of the waste of timber in utilization is unavoidable, but with careful management a portion of it may be saved.

A large part of this yearly consumption of timber in Canada is due to the necessity of replacing timber which has decayed in use. The necessity of replacing at frequent intervals all the timber used for ties, poles, posts, mine props, piles and shingles is due chiefly to the destruction of these articles by decay.

It has been proven in Europe and the United States that a cheap process of chemical treatment applicable to almost all timbers doubles the life of the timbers. Doubling the life of ties, poles, posts, mine props, ties and shingles would mean that only half as much timber would need to be cut each year for replacements as is now cut. The general adoption in Canada of a system of giving railroad ties preservative treatment before use would bring about a saving of over 5,000,000 ties yearly. This would, allowing for the cost of treatment, mean an annual saving of from $55 to $60 on every mile of track in Canada.

The general use of timber preservatives is particularly important in Canada because we have in our forests but limited quantities of naturally durable timber, and very large quantities of timber which decays quickly in contact with the soil. The durable species are being culled, the non-durable species are being left or are being used at a loss. Were the non-durable species given a preservative treatment, for which they are naturally adapted, they would give most efficient and economical service, would add to the revenues and resources of the country, and would lessen the drain on the naturally durable species.

Many Ties Chemically Treated

Seventy-one plants in the United States reported a treatment of 17,933,918 hewed ties and 8,500,657 sawed ties during 1910. There were also treated by these plants 9,383,366 board feet of switch ties; 1,402,109 board feet of bridge ties; 7,826,749 lineal feet of piling; 1,809,723 square yards of paving blocks, 85 per cent. of which were yellow pine, the remainder being made up of Douglas fir, red gum, larch, and Norway pine; 435,462 lineal feet of poles; 142,093 cross-arms; 43,648,101 board feet of bridge timbers; and 49,638,844 board feet of other construction timbers. Approximately 30 million board feet of various other materials, such as posts, flooring, mine timbers, wood conduits, car sills, car flooring, tie plugs, barge timbers, etc., were also treated.

The following comparative statement of material treated in the United States during the years 1907 to 1910 has been compiled from statistics collected by the Wood Preservers' Association and by the Forestry Service. The table is instructive mainly in showing the tendency toward the use of certain preservatives. It will be noted that of the approximately 100 million cubic feet of material treated in 1910 with creosote and with zinc chloride, considerably more than half was treated with creosote. In 1909 there was less material treated by these preservatives than 1908; 1910, however, shows a decided increase in the amount of material treated.

Crossties are particularly liable to decay, since they are used under conditions which are favorable to the growth of wood-destroying fungi. Consequently, the railroads have always taken a leading part in timber preservation in the United States. Fifteen railroads report the operation of timber-treating plants; many also have ties and other materials treated by commercial plants.

The perusal of the individual reports of 1910 shows also a tendency toward the treatment of certain classes of material which have not heretofore been treated to any great extent. For example, the railroads report the treatment of large amounts of tie plugs, pole brackets, fence posts, pole steps, tunnel wedges, and planks.

Protection of Timber Against Fire

Precautions Necessary in Logging Operations—Disposal of Debris—Government Supervision Suggested

By Wynyard C. Gladwin, Chief Fire Warden for B. C.

Wynyard C. Gladwin

ALL disastrous forest fires have a small beginning, and 95 per cent. of them have had a certain amount of debris left from logging operations, or from settlers clearing land in the close vicinity of the forest to start these fires in the first instance. This applies more to provinces of the Dominion other than the Prairie provinces, where large tracts of timber have been destroyed by prairie fires. According to the conditions in which the brush and tops are left from logging operations, so can the danger to the adjoining standing timber be gauged. In my opinion, the only method by which a proper and safe system can be reached in this matter is through proper legislation by the government of the different provinces, in which certain regulations would be laid down, stating how the debris from operations are to be disposed of. This, of course, would be opposed by a percentage of timber holders in the provinces where the timber holder has a Crown grant of the timber land. It would be considered as dictating what he should do on his own land, but the whole country at large might suffer for something that would be caused by conditions existing on his land. I claim that the government should have the right to say how he should leave conditions, so as not to menace property other than his own.

A system of trimming the tops and piling them as the logging operations are carried on, and burning them off in a time when conditions are safe for so doing, under direction of government timber rangers, would be cheaper and a most effective way of doing away with the debris—and thereby doing away in the end with the most dangerous causes of timber fires, as the rotten material on the bed of the forest becomes the fertilizer for the next growth. It is of the greatest importance that this rotten material should not be burned. By piling the debris, the percentage of ground burned over would not exceed ten per cent., and, further, the small timber which is left standing would in this way be protected. Otherwise, not only is the young timber comparatively destroyed by the fire, but the ground is generally burned to a depth as deep as the decayed matter goes, thereby destroying everything that would hasten a new growth on the same ground. Then follows what becomes most destructive, the great rush of water from the melting snow in the spring time, washing the soil from the hill sides, swelling the streams to torrents for a time, and as the dry season advances the streams dry up; all from the cause of the vegitation being burned up, and nothing being left to retain the moisture. We see how far reaching is this matter of doing away with every cause that may endanger and destroy the standing timber, and wooded tracts of the country.

The cost of piling should be paid by the operators, and it should be done when the timber is being cut—all old stubs to be cut—tops to be trimmed and piled. The cost of burning, where the government have an interest in the timber, such as stumpage tax, could be paid by the government and the burning carried on under the government rangers or supervisors.

The providing of a force of timber rangers I think can best be done through the government having control, and by levying a special tax on every acre of timber, for a fund to carry on this work. The government to pay for all patrolling and fighting of fires.

I believe of all the most important features of forestry, none is more vital to the welfare of the whole matter than the mode of cutting, and disposing of the refuse. If we are to protect our forests that they may become a perpetual means of revenue, we must protect them as we would any other crop that the land is called on to yield. In countries such as Germany and India, where the state controls and owns the timber, and sells the amount required by the manufacturers directly to them—they must cut the timber that is marked by the ranger, and remove everything. The state, by this system, has a perpetual growth coming of the land, with nothing left from the logging operations that may cause a fire to start. In India the state owns the timber lands, these are patrolled and looked after by a body of some 15,000 patrolmen—with 500 officers, yet after paying for the maintenance of this large staff, the revenue from the timber sold adds some three million dollars to the treasury.

The great trouble in the past with the forests in Canada seems to have been that we thought there would be no end to the supply. But fire and waste have done away with more than has been marketed; the time has come when the people must "wake up" and make laws and regulations, and see to it that they are carried out, not for the benefit of a few, but for the nation as a whole; that not only may the present generation benefit by it, but that generations to come may benefit by the foresight of the present in preserving this great natural asset.

Motor Trucks for Lumber Delivery

One of the largest among Chicago lumber dealers has been using an automobile truck for several months with good success in the delivery of planing mill materials, says The American Lumberman. Other dealers here and elsewhere are likely soon to fall into line, although they do no expect to discard horses altogether. Commercial motor trucks have gained headway steadily and the increasing number and variety of such vehicles seen upon the streets of metropolitan cities and even centres of smaller growth are everywhere impressively noticeable. This tendency, of course, does not signalize the entire extinction of horse power; without much doubt it does mean that its future will be marked by the steadily increasing retirement of that noblest of animals, the horse. That the motor delivery truck is gaining and will continue to gain favor in the lumber circles of the country is in growing evidence where they can be utilized to advantage.

Steady Prices During 1911

Perhaps the most striking feature developed in the general lumber market thus far this year is the fixity and stability of prices, says The Lumberman's Review. There have been few quotable changes in either direction, and demand for nearly all classes of lumber has quite fully taken care of production. In very few lines has demand so far exceeded supply as to create a strong sellers' market! but, on the other hand, the buyer has not ruled the market on many, if any, varieties of lumber. There have been no fancy prices, and yet the bargain counter has not been in evidence. As a rule, the buyer has "shopped around" a great deal before placing each order for supplies, and the yard men have rested content so long as there was a fair assortment in the sheds. Round lot buying for stocking-up purposes has been conspicuous by its absence. In short, we are having what may properly be termed a steady market, a condition which portends neither excessive profits nor material losses. It has been neither a fat nor a lean year. That there has been a "normal play of free competition" is a fact beyond question.

After a fight of twelve years Theodore Ludgate, of Seattle, Wash., who built a mill at Arrowhead, has been successful in validating his lease of Deadman's island. He secured his lease in 1898, and purposed to erect a saw mill. The island is in Vancouver harbor and opposite the aristocratic West end. The residents objected. Since then the case has dragged through all the courts. Now the highest tribunal of the Dominion declares Mr. Ludgate has possession. The island has increased enormously in value, for Vancouver has grown from a city of 25,000 to 150,000 in the last decade or so. It is probable that wharves and warehouses will be erected on the property instead of a saw mill, as was first planned.

The three northwestern associations of lumber manufacturers in the United States are arranging a scheme to consolidate under the name of the West Coast Lumber Manufacturers Association. The organizations affected are the Oregon and Washington Association, with headquarters in Portland; the Pacific Coast Lumber Manufacturers Association, Seattle, and the Southwest Washington Lumber Manufacturers Association, Centralia, Wash. Economy, lessening of competition and extension of the lumber markets are sought through the proposed amalgamation. Centralia will be the headquarters of the association.

Reports from Shelborure, N. S., state that serious forest fires still continue in the country round about. 33 barns and two lumber mills had been destroyed at the time of the latest report. The fires were still advancing and it was believed that the large mills of the Sable River Lumber Company, together with 5,000,000 feet of lumber which was ready for shipment could not be saved.

The Retail Dealer and His Problems

A Problem in Competition—Can Anyone Solve It?

Retailers' Troubles

By George Wilson Jones.

"Hello, old settler, glad to see you! Begun to think you'd forgotten all about us down in this neck of the woods. Take a chair. I've got these figures to go over and then I'll talk with you."

That's how Billy Jordan who runs an up-to-the-minute, tiptop, ship-shape retail yard at D—— gave me the "glad hand" as I dropped in on him a few days ago. Billy is one of those men you call by their first name before you've been with him ten minutes. You do it instintictively, and it doesn't show any discredit either. I've known him off and on for ten or twelve years and don't recall ever hearing him called anything but Billy. I suppose a new yard man, if he ever hires one, might call him Mr. Jordan the first time he addressed him, but if he did, the chances are that Billy would look around to see whom he was speaking to. That crack at the new man puts me in mind of the foolish notion once expressed in my hearing that you have to get new employees frequently to keep your machine up to a concert pitch. Billy Jordan keeps life in his organization with a bunch of old fellows who have been there ever since I first became acquainted with him. He does it by treating them as men and making each one feel he's part of the works. Of course if he found a fellow who didn't respond to such treatment, that particular chap would get his walking papers instantly, if not sooner, for with all his geniality Billy is not a man to be hoodwinked, bamboozled, flimflamed, or monkeyed with.

As Pretty a Team of "Chunks" as I Ever Saw

Acting on his suggestion, I took a chair near the window looking out onto the yard and watched as pretty a team of "chunks" as I ever saw drawing out a load of shingles. The horses of a lumber yard always appeal to me. They seem to acquire some of the solid qualities of the material they draw. I followed the team out and watched them till they turned the corner, then I came back into the office just as Billy swung his chair around ready for a visit.

"Pretty good team you've got there, Billy."

"Yes, they're a smashing good team, but what's that got to do with your coming to R——? You're not buying up horses now are you?

"No, not so you'd notice it," I replied. "My nose for news got busy so thought I'd hike down here. Sort of felt there might be something doing. You know we war correspondents like to get in on the ground floor before the smoke clears away. How are things, anyway?"

"Rotten's no name for it Jonesy my boy, I've got the toughest scrap on my hands I ever had."

"I'm sure sorry to hear that, but glad I can get the facts while they're hot. Take this cigar and put me next."

"Thanks. I am really glad you've come, for I want to talk this matter over with you. Maybe you can suggest what I'd better do."

We then settled back in our chairs, Billy's feet on his desk and mine braced up against the stove. After we got the smoke circulating in a friendly manner, we got down to business.

A Well Known Retail Trade Snag

"You remember the Parsons yard, don't you?" Billy began.

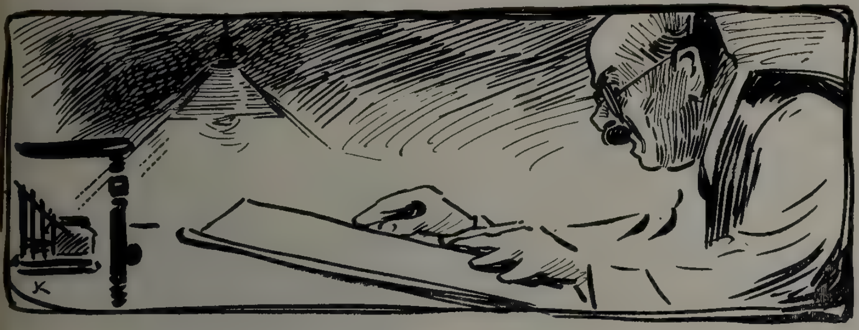
"I certainly do. He was in business here the last time I called, and a mighty fine old gentleman he was too."

"Well, he sold out about the first of the year to a man named N—— who used to be a line yard manager in Minnesota but got the notion that he knew all about running a lumber yard and thought the chances were better for him here than back in the States. Soon after N—— came, he called on me. He struck me as being a pretty decent sort and we had a pleasant visit. He said he was a newcomer and wanted to get acquainted so we could get along nicely and keep out of the rows that usually bob up when a new man goes into a town. This sounded good to me, and I told him Mr. Parsons and I had been competitors for a good many years and always got along finely and saw no reason why he and I couldn't. We went around the yard and I showed him how we did things, the kind of stock our customers called for, and gave him a lot of pointers about conditions here. When we came back to the office, I showed him what we were getting for stuff, and a lot of such information. After a little more talk he started to go, but came back toward the desk and said he supposed as there were only two yards he was entitled to half the business. This took me off my feet, for he must have known that the Parsons yard was smaller and could not in the nature of things do half the business of R——. I explained the situation to him but he stuck for half. I told him Parsons never had over a third of the business and that I couldn't afford to throw over enough to make things even. I suggested I show him my books for five years and let him make a statement for the same period from the Parsons books, and divide on the amount each yard was entitled to. He didn't take to this, saying Parsons was an old fogy and what he got was no sign what could be gotten out of the yard. We talked quite a while and he finally had to admit that he was not entitled to half the business, and when he left seemed very friendly."

"That was a reasonably good start, but I suppose he didn't stick"

"You've hit it right. Now I wouldn't care if he went about it like a man, for I'm not afraid of square, open competition, and don't ask any favors. After a little, one of my old customers came in and said N—— was bragging that he would soon have me on the run, that I'd been robbing the people, and that he was going to show them what a real lumber yard was. Then another customer came to me with that story that N—— said he would give his lumber away before he'd see me doing all the business. This made be pretty hot, so I called N—— up on the phone and asked him that there was in these yarns. He didn't give me much satisfaction. Said he'd thought over my proposition and couldn't see his way clear to divide that way. I told him I had no kick coming on decent competition but didn't like the way he had been talking to my customers. He just said there was no use discussing it, and hung up the receiver. That was a couple of months ago and since then things have been cut wide open. One case was par-

Supposed he was entitled to Half the Business ticularly annoying. You know sometimes I make plans for my customers, and one day a man who had bought quite a lot of stuff came in and said he was going to build a small house and wanted me to drawn the plans, promising me the business. I went ahead and got them out. There were three contractors figured, or rather two contractors and a couple of carpenters out of a job who joined forces and set up as contractors. These fellows took the bill to N—— and when the bids were opened, they were very low. My customer came over and told me just how it stood. He said he hated to give N—— the business after promising it to me, and offered to give the two carpenters $50 to drop the matter or else buy of me. I agreed to make some concession too. He made them the offer but they went right over to N—— and of course de duplicated it, giving them the lumber at the original price. I didn't want to stir up any trouble, so told him to withdraw his $50 offer and buy of N——. You see N—— was practically a hundred dollars below me on the original figures, and with the extra $50 he was willing to allow, he was under me $150, and I know from my figures that there was little or no money in it, so he must have been willing to lose a tidy sum just to beat me out of the job."



Found he was Loading Up—at a Loss

"That was rubbing it in with a vengeance! I know how hard it is, but why didn't you call on him and see if he wouldn't listen to reason?"

"Thought He Had Me on the Run"

"I did that very thing, but from his manner I took it he thought he had me on the run and meant to whip me to a finish. All he would say was that if I would agree to be satisfied with half the business, he would talk with me, but not until I was."

"That's a hard one to crack, but you know the history of these fellows. They all go broke. All you've got to do is to figure down and throw the work to him till his capital is used up. I know a case of that kind where the scrapper found he was loading up with business at a loss and soon saw where it would land him, and he came to time and was the best sort of competition after that."

"Hold on, there, old man, you forget one thing. While N—— and I are doing this, the trade in this whole section will be shot to pieces. We wouldn't recover for years. Every farmer for twenty-five miles or more would hear of it and drive in here to buy, and that would make the other yards mad and they would be drawn into it. These things spread like the small-pox. I tell you, Jones, this is a hard problem. I haven't worried so much about anything since I began business. Suppose instead of fighting, I sit tight and keep my prices up? Where will my trade go to? When a fellow's hit, he wants to hit back, and that's how I feel, but sometimes its foolish. I'm certainly thinking of telling N—— he can have half half the business if he'll call the fight off, but I hate to do it. Its too much like admitting I'm licked, but I've got my family and my business to think of, and I can't afford to do anything rash just for the sake of the fight. I can hold my trade———."

"Yes, that's just it! You can hold your trade, and even if you offer to give N—— half the business, how can you turn it over to him? At even prices, N—— won't have a 'look-in' and after trying it for a week or two and finding the trade all going to you, he'll begin cutting and slashing all over."

"Yes, that's true. I've thought of that, and that's another reason why I am up a stump."

That's the gist of my visit with Mr. William Jordan of R——, and I'm frank to admit right here I don't know what course is best under the circumstances. My object in writing it up is in hope that some retailer may see it who is inclined to start a fight for trade and stop right where he is. If N—— had started in fair and tried to build up his trade in a legitimate manner, he might have secured half the business in R—— without any hard feeling. He's trying to "force-feed" his business and its mighty apt to have a fit of indigestion that will lose him everything. It seems to be a fact that every once in a while a man butts into a business without the first instincts of a business-man. Before you can practice law or medicine, you have to show certain qualifications, but any fellow with a few hundred dollars, and sometimes less, can get out some stationery, hang up a sign, find a few easy marks to supply him with stock, and go into the lumber business. In most cases these fellows know nothing about the cost of doing business, they are loose with their credits, and by their tactics rob their competitors of legitimate profit. A case of that sort came to my attention one night at the Russel House at Ottawa. I met a friend of mine there and we got onto this subject of men who had no right to enter business. He told me of a man in his town who had recently failed for something like $15,000 and it came out in the investigation that he never had over $300 invested. It took him two years to reach the limit, but during that time he had been a veritable bull in a china shop and aside from causing his creditors heavy loss, cut his competitors out of what they were entitled to as well. The insane desire to get "into business' as they call it, wrecks many a good, competent employee who can work for others and earn a profit for their employers, but who lack the qualifications that make a successful business man.

Trade Journals—Their Importance

You would scarcely think that at this age of the world there would be a single retail lumberman who was not a subscriber to his trade journal, but such is the fact, sad to relate. I often boast that I can tell from the appearance of a yard whether or not the proprietor is a subscriber, and when called upon for proof, state simply that the man who has the most modern yard must keep in touch with conditions, and nowhere can he find those conditions outlined except in his trade paper. To put it bluntly, when you refuse to subscribe you deliberately shut off one of the most important means of communication with your fellow lumbermen, and unless a man is egotistical enough to think he knows so much no one can teach him anything, he owes it to himself, his family, and his business to keep posted. You may say that's all theory, and maybe it is. That's why I put it before my proof. Now I will give three examples. If I were a lawyer, I should term them exhibits No. 1, No. 2, and No. 3.

A friend of mine who has one of the best equipped small yards I ever saw took me on a tour of inspection at my last call, and finally we came to what looked like the village fire department's hose drying tower. Opening the door, he ushered me in. There in neat stalls were his mouldings, upright.

"What do you think of that for a moulding room?" he asked.

"As fine as I ever saw, but why go to the expense of building this place when you used to keep them in the shed?"

"Did it ever occur to you," he questioned, "the amount of waste when mouldings are kept flat? When a customer wants a piece, you yank it out for him, and if you could pile up the amount of stuff broken in this way, you would never pile any more in the shed. Then see how clean these are." and he rubbed his hand over a number of pieces. "You couldn't do that if they were outside, so I could keep my stock here for a hundred years without any deterioration. When a man buys moulding, he picks clean pieces, and you are left with stuff that won't sell if you permit dust to settle.

"Where did you get this idea?"

"From a trade paper a salesman left here one day, and I want to tell you that tip has been worth a good many dollars to me."

My exhibit 2 is about a retailer who had a small mill in connection with his yard. Usually the inside of a mill gradually grows grimy and black from dirt and dust, but this man kept his painted white. He said he first saw the value of a bright interior from a description of the mill of the Blakeslee Lumber Company, at Albany, N.Y., in a lumber paper.

Exhibit 3 I put last because I happened to be the one who made the suggestion. In an article written a year or more ago I described what to me was a new idea. The retailer sprinkled the driveways in his shed with crude oil the same as used in some cities on their dirt streets. This retailer caught the idea and by giving his driveways a treatment in the spring as soon as the ground was settled, he avoided the ruts and clouds of dust that make a shed a pretty disagreeable place when there is any wind blowing.

Now here are three ideas, and if any one of them is adopted, you will have received many times over what your subscription costs. This may be like a temperance lecture at a prohibition convention, but one can never tell, and if the ideas are passed along, they may result in a number of subscriptions, and thus in better yards. The system of studying through correspondence schools is deservedly popular, and the usual fee is $40 for twenty lessons. Now why not consider your Lumberman a correspondence school? Not a bad idea, is it? Divide the cost by the number of issues you get, and you will see what it means. We all want better yards, and better informed proprietors, for then you eliminate wildcat competition, which invariably comes from ignorance. Let the retailer know what it costs him to do business and how he can improve his facilities, and he is at once a better competitor.

THE WOODWORKER

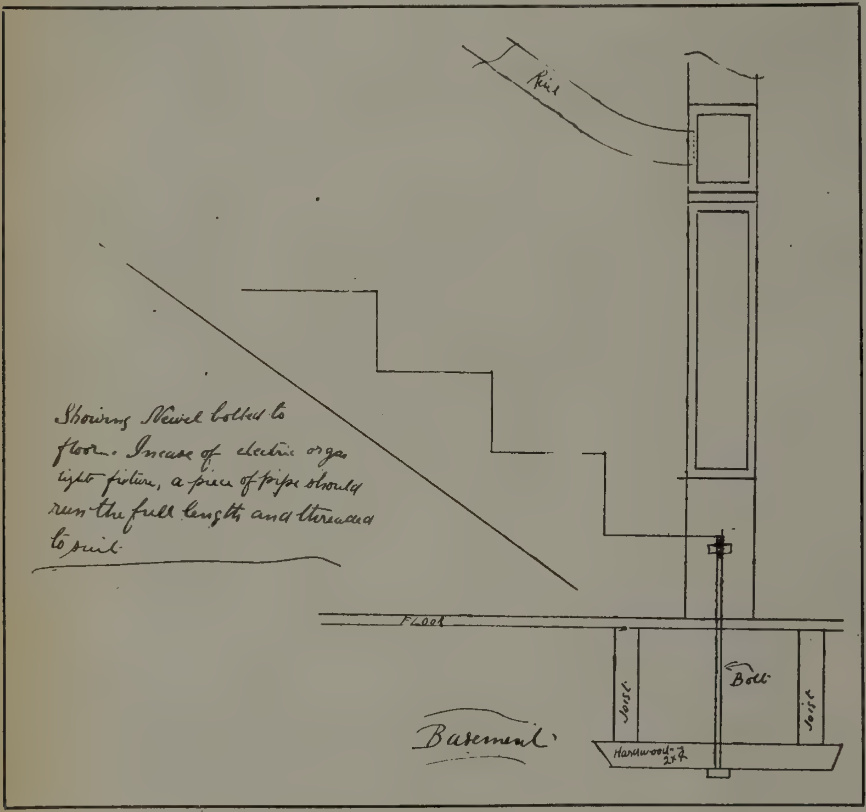
Mill Built Stairs—Elements of Design

By Frank Bowers

WE are very much too prone in this age of power-driven machinery, when noting the ease with which many processes in woodwork construction are chopped out thereby, to wonder whether it is worth while learning to do anything with our hands at all. But great as are the capabilities of machinery, we should not lose sight of the fact that it is still an agent, and auxiliary power to lessen our manual, but not mental exertions. If we fail to bear this in mind we will be on the high road towards a fate worse than Sodom and Gomorrah, the state of listless inaptitude.

In the course of training for general usefulness perhaps there is hardly anything so fascinating as woodworking. It is with us from the cradle to the grave. Even Santa Claus (who, by the way, has a great eye for business) takes care to have a good supply of woodworking tools, on card usually, for his young friends, and Madam will essay to saw a board and do a stunt or two at the family wood pile.

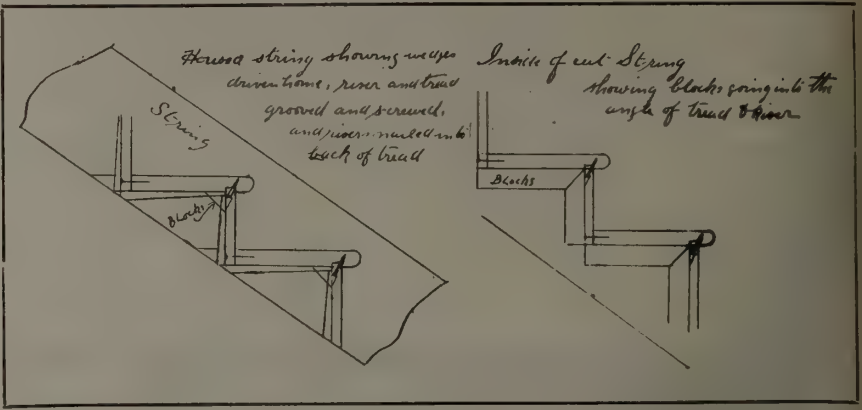
Seeing that all this is the case it behooves us, owing to the increasing demand, and the decreasing supply of woodworking material, to be more thorough in our construction. I hold that a job taken in hand with fairly good material, and well constructed, is better economics than to do the same job with better material and sloppy work, inasmuch as the latter will soon let in those deteriorating influences dragging down what was good, to its own miserable level. So that the whole can be summed up in one word, both literally and figuratively as "rotten."



Showing Newel bolted to floor. In case of electric or gas light fixture, a piece of pipe should run the full length and threaded to suit.

I would like to call your attention a few moments to that very essential piece of work in our modern buildings: "the stairs"—the thoroughfare that leads from one storey to another. You could not have failed to notice how, in many instances, the designer has a tendency to chop off space that has been allotted to the stairs. As the stairs are among the last pieces of work to be done, unlimited opportunities are afforded, so to speak, for taking off a few feet to fill some other deficiency. So, when the stair-builder comes to get in his work he finds it is more a job for an aviator than a woodworker, for, like the proverbial dove, there is no room for the sole of his feet. This surely is a mistake, and I believe often an unwitting one, for I have often heard, after a few yards of finished plastered partition have been torn down, and trimmers and joisting cut back, those ominous words "I wish we hadn't done it."

One method we are getting out of, though, is what I call the treadmill type, that is, one long flight leading from front hall to landing, without a break, which would make a strong man wonder when he would get to the top, to say nothing of the doubts and fears of delicate women, elderly people and little children. But, even it had its advantage over its present rival, in as much as it had a hand rail from bottom to top.



Housed string showing wedges driven home, riser and tread grooved and screwed, and risers nailed into back of tread

Inside of cut String showing blocks going into the angle of tread & riser

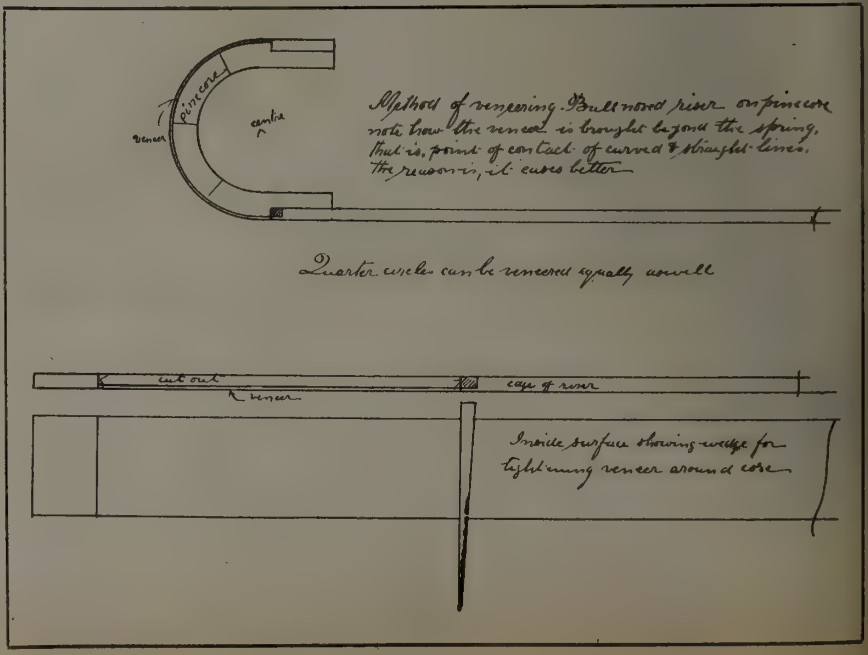
Now, the idea is to start with a few steps with a short piece of handrail butting into a wall at the first landing (about all that is in sight from the front door). Then you can continue the rest of the journey from a small level landing, or often, which is worse, several winders without any support whatever, except your own natural equilibrium, which generally ends, in the case of little folks, in a bad tumble from top to bottom, or pitching through a window, which seems conveniently placed for that purpose.

The ideal stair that I would suggest is not new by any means, but one we have discarded in our rage for cheapness. That is, the space cut up into two or more flights, level landings where practical, handrail from start to finish without a break, and a lower rail for the little ones. Above all, there should be thoroughness of construction, so that when you walk on them it won't be a signal for them to tell you all their weak spots.

Stairs of any pretention at all should always be specified to be "mill built," for no matter how good a workman may be, he cannot do justice to the job on a building where there is always more or less dampness, where there are no facilities for veneering curved risers, dowelling and cramping joints, where glue cannot be used to advantage, as it perishes before it sets, and where many other difficulties too numerous to mention are continually present.

Good construction would consist of carefully selected material; strings housed in not less than half inch; five eighths is better if thickness of stuff will allow it; wedges made to fit, glued and driven home; step and riser tongued and grooved and screwed from the back and neatly blocked; in case of open string the blocks should be made to go right into the angle made by tread and riser; the steps dovetailed (not bored) to receive balusters.

The starting newel on the ground floor should be bolted through the floor, so that it can be easily fixed at any time with a turn or two of the nut, a much simpler and neater job than letting the newel run through the floor and keying.



Method of veneering. Bull nosed riser on pine core note how the veneer is brought beyond the spring, that is, point of contact of curved & straight lines. The reason is, it cures better

Quarter circles can be veneered equally as well

Inside surface showing wedge for tightening veneer around core

Where risers are curved the steps should run under them and be screwed up from underneath. This will give you less bending on the riser, besides making a perfect joint. The back of the straight steps can be tongued and the riser grooved to receive it or a very good job. In fact, I think just as good a job can be done without it, the material being seasoned, the riser passing down and thoroughly nailed. The nails being at right angles with the strain, there will be no fear of joints opening.

All steps and risers engaging with newels should be housed or gained into them, also strings and handrailing where it makes a right angled butt. If wreaths are used, learn some system of lines that will avoid cripples. Never have a joint on the spring, even in ordinary curving it is not advisable, and in stair building it is fearful.

A few pointers say from the works of Robert Riddle and a good eye will result in a very graceful combination, I think you will endorse me if I say that a man who can take a piece of tree and make it twist and turn in easy flowing curves just as he wishes has attained something worth while.

And in closing I would say, if we ever want to get upstairs we must first go upward then onward like the souls of true Christian spirits.

Cooperage Industry on a Sound Basis

Production About Equal to Consumption During Present Year—Slack Barrel Stock The Trade Staple—General Consumption Increasing.

By J. Innes

J. Innes, Chatham, Ont.

The cooperage industry in Canada this year has been on a very sound basis, the production being on about a par with the consumption. The fact is, that if the large apple crop, which was expected, had developed, considerable stock would have had to be imported into the country. The apple crop, however, is light, and the consequence is that there is a small quantity of staves available for export.

Reports from 58 mills in Ontario give the production for 1911 as follows: staves, 58,250,000; hoops, 20,125,000; heading, 3,600,000 sets.

A number of small mills which make stock for local consumption only, have not reported, but we do not think that this will increase the production more than ten per cent. at the outside. All of the heading and hoops manufactured are used for home consumption. There will probably be ten per cent. or a little better of the staves manufactured, exported to the United States and Europe.

The production in New Brunswick and Quebec is not very heavy this year and a large part of this production is nail keg stock. As near as we can gather Quebec and New Brunswick will produce in the neighborhood of 1,000,000 sets of heading and 12,000,000 staves. Two-thirds of these will be for nail kegs, spike staves and other classes of kegs; the balance in long staves for fish, lime, cement, etc., a considerable portion of which is exported.

The production in Nova Scotia will be comparatively light this year. We do not think it will exceed 16,000,000 staves and 900,000 sets of heading. There is considerable stock now being manufactured in British Columbia, and from advices we have received we believe that in the neighborhood of 8,000,000 staves and half a million sets of heading will be produced.

Ontario is the only province which manufactures elm hoops to any extent. Bark hoops are made in the other provinces, but there is no way of getting at this production in anything like correct figures. Quite an amount of stock is now being manufactured in Newfoundland, only all of it is used for fish cartons, Newfoundland importing from the United States the oak staves and heading required for their oil barrels and hogsheads.

There have been a few gum staves imported into Canada from the United States for flour barrels, but these are not meeting with any great appreciation by the millers, as occasionally they arrive musty and are liable to flavor the flour. Nearly all the oak staves and heading used in Canada are from the United States, as tight barrel stock is only produced in very small quantities in Canada, the oak and ash necessary for these staves and heading being either too expensive or too scarce to warrant their manufacture into staves and heading.

The production in Canada of cooperage stock is now almost entirely confined to slack barrel stock. The trade conditions throughout Canada have been improving in the last twelve months, and as the barrel has been found the handiest and the most sanitary package for food stuff, and the safest package for other purposes, the consumption of barrels in Canada is increasing.

Staves and hoops are principally manufactured from elm; heading from basswood and hardwood. Elm, however, is getting quite scarce throughout the country, and it is only a question of time when the elm will have to be reserved for hoop manufacture and staves made from other woods such as birch, poplar, etc., which make a good stave, and when properly manufactured, make an excellent barrel.

The reciprocity treaty, which is proposed to be put into effect between the United States and Canada, admits staves free of duty from the United States into Canada and vice versa. Heading and hoops, however, are not affected. This treaty will work well for the stave manufacturers and the coopers on account of the geographical situation, as staves can be brought from the United States to some parts of Canada on much lower freight rates than they can be shipped from the producing part of Canada to the consumer, while the Eastern States can be reached by the Canadian manufacturers at low rates of freight and enable them to dispose of their surplus in the United States without any difficulty.

The stave manufacturers are, therefore, very much in favor of the reciprocity treaty, as far as their business is concerned, and leave the general effect of the treaty for the statesmen of the two countries to thrash out, who are sufficiently patriotic to accept or reject the treaty according to whether it is good for the country at large or otherwise.

Regarding the consumption in Canada, as already stated the general consumption is increasing. The apple barrel trade, however, is a factor in the fixing of prices, and as this year the crop is only a moderate one, it is not likely there will be much fluctuation in the prices of cooperage stock, as the production is not large enough to leave any large surplus on hand and cause any of the manufacturers any inconvenience in carrying over stock that will not be required for actual consumption this year, whereas a very slight spurt in the consumption would affect the market considerably.

Would Simplify Shingle Grading

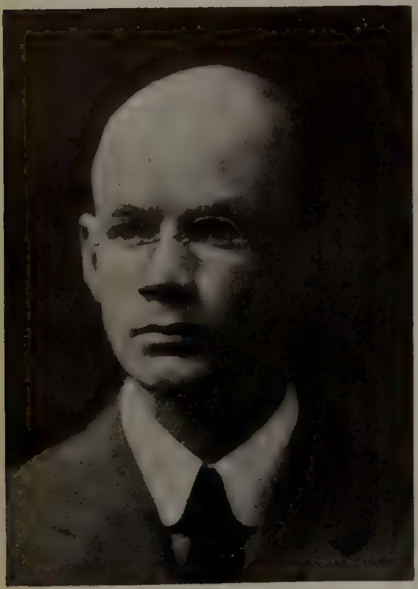
The Pacific Coast Shippers' Association, through its secretary, F. D. Becker, Seattle, Wash., has started a campaign for a simpler method of grading red cedar shingles. Mr. Becker has mailed circular letters to 20,000 of the most prominent retail lumber dealers asking for their personal views on the proposed change in the grading rules. The campaign will be carried on by the Pacific Coast Shippers' Association all over the country with the exception of the New England and South Atlantic States. At the present time there are eight grades of shingles manufactured. The Shippers' Association wishes to encourage the manufacture of three standard grades only, which Secretary Becker says would result in a more stable market, better grades and smaller investment by the retailer who handles the red cedar shingles. Mr. H. S. Stine, who is the father of the movement for simpler grading, suggests the manufacture of only one thickness of sixteen-inch shingles, the new grade to be thicker than the present "Star A" grade and thinner than the present "Extra Clear." The opinion of lumber dealers on the merits of an air-dried shingle is also asked for in the circular letter to retailers.

Newfoundland is beginning to export lumber. Last year it exported lumber to the value of $144,600 and wood pulp to the value of $69,164.

CAMP DEPARTMENT

Forest Surveys—Wherein They Serve

By C. A. Lyford



C. A. Lyford, Montreal

THE maps and estimates resulting from a forest survey furnish an inventory of raw material in a complete, concise, classified form, such as is obtainable in no other way. They provide a usable and convenient vehicle for taking the directors and managing officers over the ground, without necessitating several trips to the scene of field operations, with attendant inconveniences, and expenditure of valuable time and energy.

Maps made by competent Forest Engineers and constructed in such a way that all pertinent information, (except the actual figures of the stand of timber), is shown; and which are arranged so that they can be kept up-to-date by annual revision (mapping of new cuts, etc.) will enable the managing officers to obtain a bird's-eye view of their operations—will enable them to see at a glance just what and how much area has been cut over—how much is waste land — how much timber is coming from each watershed—the location of routes of travel through the property—the exact location of camps and areas tapped by each one—the location of dams, chutes, and all improvements, and a correct impression of the relation of various features of the property, one to another as regards distance and direction. With the maps and estimates both at hand, general plans for operations can be made for years ahead. Moreover, a distinct advantage is gained for the men who are financially interested in the property, but have no close connection with the management of either the office or field operations. With the aid of an adequate map system and estimate, the manager can readily show them in a comprehensive way just what is going on and where it is going on, and what relation the amount of wood used annually and the area cut over bear to the total supply of wood and the total area remaining uncut.

Just within the past few years the form of negotiable security, known as timber bonds, has begun to appear as an important item in the financial markets. Hitherto timbermen have been more or less at the mercy of the banks, when in need of financial accommodation, but now bonds afford timber owners a simple and convenient vehicle for this purpose; and furthermore, furnish a substantially secure and productive form of investment, for which there appears to be a growing demand. In the near past, timber bonds have sold very readily in the West and South of the United States, and are being taken up to some extent in the Eastern States and Canada, and the indications are that they will be much more in demand in the near future. Timber bonds may be issued by a company for several purposes. The company may wish to acquire additional facilities, or to refund existing liabilities, or enlarge available working capital. Standing timber affords ample security for these bonds, and the prospective value of immature timber of cut-over lands and of the natural reproduction where clean cutting has taken place in many cases may equal the value upon which the bonds are predicated. A company which is contemplating a bond issue cannot find a better medium for exhibiting their resources in standing timber than the maps and estimates furnished by a reliable Forest Engineer, as the result of a forest survey. The maps show the areas of virgin timber, and a record of past operations. The figures of the estimate make up the inventory, and in conjunction with the maps, provide a convincing voucher in presenting a proposition for bonding timber properties, to the consideration of the public.

No system of fire protection can be effective, however, without maps, which show the lay of the land, the quickest and best routes of travel from one part of the forest to another, the courses of streams, and the location of bodies of water, etc. It is admitted that the prevention of fires is the most important aim of all organizations for fire protection. In order to prevent fires getting under way, a patrol system is necessary. It is not very difficult to perceive what an immense advantage accurate, detailed maps would be to a district supervisor of fire rangers in enabling him to see just how his men were placed, and in attaining an economical division of the country into patrol units.

In the State of Wisconsin, a bill was recently proposed for levying a tax of 2½c per acre on wild lands in the Northwestern part of the State, the proceeds to be used to pay for a forest fire patrol. This bill passed the Senate, but was defeated in the Assembly. Although this bill did not pass both houses of the State Legislature, it exhibits the general tendency toward increased efficiency of forest fire protection. When the time comes that Canadian provinces realize the importance of fire protection to such a degree as to result in imposing a tax of similar magnitude for a similar purpose, the timber owners who can show detailed maps of their property, which greatly facilitate the organization of a patrol system, would justly be entitled to a discrimination in their favor, equal to a fair portion of the cost of the forest survey, which provided them with their maps, making the patrol problem a fairly simple one for these favored sections.

A great many owners of standing timber are holding their property with the view of eventually operating, when industrial conditions, railroad facilities, etc., permit them to do so to advantage; or, they may be holding the timber until such time as they can sell at what they consider a fair price. A majority of such timber owners are in a state of considerable ignorance as to the exact area and condition of their limits, and in many cases, the boundary lines are either not located at all, or conflict with adjoining boundaries. There are usually cruisers' reports on nearly all these properties, but they are at best but rough estimates, and in very few cases have the areas been covered systematically, and in almost no cases are there any maps, showing more than limit lines, and a few main streams and lakes. These owners can put themselves in a certain strong position as regards the value of their property by having a forest survey made, and then they don't need to ask anyone about anything in connection with their property. They know all there is to know about it themselves. They will have obtained a reliable map—a sort of picture of natural features and conditions, and a reliable inventory of the timber, and a great deal of information on all points of interest to a practical lumberman. Along with the forest survey, boundary lines may be established, so that there will never be a chance of misunderstanding with adjoining owners.

Perhaps the consideration of the value of the forest surveys in their relation to the protection of forests from fire, should have had first place here. The great and growing importance of fire protection for the forects of the Provinces is evidenced by the recent appropriation of a considerable sum by the Quebec government for this purpose.

The Forest Fires

By Arthur Guiterman

Is this the Forest Primeval?—that redolent, hallowed cathedral
Lifted by Nature to God, the solace and joy of His creatures.
Health-giving, tranquil and strong, the source of beneficent waters,
Wooing the quickening rains, guarding the bountiful wheat-lands?
This was the Forest Primeval;—this roaring, devouring furnace
Billowed and sheeted with flame, a pitiless, raging inferno.
See! how the sentinel pines go down, while the red-hearted cyclone
Greedily sweeps on the settlements, whirling in panic before it
Caribou, timber-wolves, deer, snorting and plunging and bounding
Mingled with cattle and men, poured through the streets, where the houses
Melt in the fury!—And now, nothing remains but the timbers
Desolate, blackened and charred, heaped over smoldering bodies.
There let the fire-weed grow, dropping memorial blossoms.

Only a camp-fire brand,—only a spark from an engine,
One of the myriads blown daily and nightly at random—
Such was the procreant seed. Come, let us thresh out the harvest.

—Life.

Mr. J. W. Tarrant, formerly with the Mount Royal Spinning Company, has joined the staff of the Wyagamack Pulp and Wood Company, of Three Rivers.

Keeping Books in a Lumber Camp

Suggestions for Practical Care of the Accounts—Important Points which can be Dealt With Simply

By Camp Clerk

THE system of book-keeping which prevails in many of the lumber shanties is certainly a long way from perfect, and the question arises whether it would not recompense lumber firms to pay a little more attention to this important subject. Accuracy and neatness can be practiced as well in the lumber camp as they can in the city office.

After all is said and done, no very elaborate or expensive set of books is necessary for the clerical work of the shanty. A good, serviceable time book, a strong ledger, a stock book, a rough day-book and two or three small check books should answer the purpose. Many lumber firms are too prone to study absurd economy in running the shanty office.

Everything is rough up there in the camp. Anything is good enough for the office seems to be their motto. But it is a mistaken one altogether. An ill-equipped office may lead in consequence to financial losses to the firm. These losses under a bad system may never be discovered, for the simple reason that there is no means of tracing them. For instance, if the time-book is improperly kept, men may be paid wages to which they are not entitled. If a man has been idle for a day, and for the lack of a proper time-book the clerk has failed to make an entry to that effect, the man, when he comes to be paid off, will receive more than is properly his due. In the case of one man, this may be a trivial matter for the firm, but in the course of the fall and winter it may amount to a considerable sum.

Therefore a proper time-book should be one of the first essentials. In some camps it is the practice to keep a memorandum book, in which are entered the names of the men as they arrive, and the date of their arrival, then if a man is idle for a day or longer the fact is entered in this book under the man's name. This, at the first glance, may appear to be a safe and simple way of time-keeping, but in reality it is not so. The practice of "putting off till to-morrow what can be done to-day" is inherent in many human breasts, and shanty clerks are no exception to this little weakness. Of course, a really careful clerk, as soon as he knew that a man was idle, would make an entry to that effect immediately; but probably the time-book is not just at hand, or has got mislaid, so he says to himself "I will remember. I will enter it later on." There the matter ends, and the entry is never made. For that reason then it is advisable to provide a time-book which must be made up every day.

A book with columns ruled for each day of the month will answer the purpose. The names of all the men from the foreman downwards, should be entered therein one under the other, and a stroke "1" placed in the dated columns day by day against the names of the men who have worked and "abs" (absent), "idle," or "sick," against those who have not been working.

"That is all very well," it may be argued, "but the shanty clerk may fail to make his entries every day, just as he did in the other case." He may neglect to do so, but it is unlikely that he will, for if he gets behind-hand it will be a tedious task to catch up and, moreover, he never knows when the agent of one of the heads of the firm may happen along, and if either of them takes up the book a mere glance will suffice to show whether the time-book is being kept up to date.

Another important matter is the keeping of a meal book with a record of the men's meals. This can best be done in a book ruled in the same way as the time-book though not necessarily so large. It, too, must be entered up every day. The cookery forms such an important factor in the running of a camp that it is essential that a close check should be kept upon that particular department. If a careful account is kept of the number of meals consumed each week, together with a weekly record of the supplies used, a firm can ascertain whether a cook is extravagant, and if so discharge him. It is probable that a cook is often blamed for lack of economy when the fault really lies with a defective system of book-keeping. If the shanty clerk makes a mistake in recording the amount of supplies used, and sends in a return showing the amount of provisions used to be in excess of what actually is the case, then the cook is blamed. The practice of sending in each week a return of the provisions used has much to recommend it, but it must be done properly or not at all.

The clerk should be the only one to have access to the storehouse. Every Monday morning the cook should notify him what provisions he needs for the ensuing week, and the clerk before handing out fresh supplies should go round the cookery and make a careful note of the amount of stock remaining there on hand. In this way he will be able to make an accurate return of the quantity of provisions consumed. Having, during the week, taken a careful account of the number of meals, he will be able to send into the head office a correct summary of the inner working of the cookery, and it should be a simple matter for someone at headquarters to work out the cost of meals per man. If they cost too much then the only thing to be done is to replace the cook by a man who has a greater regard for economy. At the same time too much emphasis cannot be laid on the fact that if the weekly stock-taking is imperfectly done, or if the record of meals is made by sheer guesswork, the lax system simply makes "confusion worse confounded."

In regard to the ledger any stout book ruled with "Dr." and "Cr." columns will answer the purpose. In making out a man's time it is necessary that his van account should be kept separate from the other items charged against him. Thus if he is in the habit of making periodical advances to his wife or mother out of his wages account, these payments should be kept separate from the van account. For the sake of simplicity a good practice would be to use the first cash columns in the ledger for the van account, and the other set of columns for the entry of payments out on account of wages, charges for doctor, mail, etc. If a man disputes the accuracy of his van account the clerk will have the amounts separately before him. Moreover, when the clerk comes to settle up his van account with his superior officer, he will have the whole of the articles which he has sold from his van shown in separate columns in each page of his ledger.

In closing a man's account the clerk can summarize the whole thing at the foot of the page in the following manner:

Bill Smith

Engaged Sept 1, 1911, as general hand at $26 per month

Balance payable to Smith… …		$28.20

A serviceable time sheet is that shown in Specimen B., and has the advantage of enabling the man to see at a glance the exact amount coming to him after all deductions have been made. The time sheets made out by some firms are so complicated that it is impossible for the shantyman, who is usually illiterate, to understand it at all. When the document is handed to him he should be able to see clearly what he is to receive when he presents it to the book-keeper at the office where payment is made. A clearly prepared time sheet such as the one shown should be the means of avoiding disputes with the men when they make their departure.

Specimen B.

The system of paying a man by the calendar month (reckoning 26 working days to the month) leads to a good deal of confusion, and is often a source of much irritation amongst the men. The only fair and practicable way of paying them is by the number of months and days worked. Under the calendar month system of payment there are many anomalies. Thus men who start work on the 29th, 30th, or 31st of December and leave work at the break of camp,—say in the middle of March—all get the same amount of pay, for they each complete two months on Feb. 28th, and commence their third month on March 1st. When the man who started work on December 29th finds that he has only been allowed the same amount of time worked as he who started work on December 31st he is naturally dissatisfied, and often raises trouble. If the clerk used a time book such as that already suggested he could at the end of each month total up the number of days worked by each man, and when he came to pay him off it would be a simple matter to reckon the exact number of days he had worked.

For the stock book, no very pretentions volume is required. A book of about two hundred pages should answer the purpose, and the clerk can rule the columns to suit himself. A page should be devoted to each article:—pork, beef, flour, butter, lard, sugar, beans, etc., etc., and one column should be devoted to the supplies received and another to those given out, thus:—

	Butter	
	Received	Given Out
Oct. 21	200 lbs.	
" 24		50 lbs.
" 31		100 lbs.
Nov. 4	250 lbs.	
" 7		100 lbs.
" 14		50 lbs.

In this way the amount of stock on hand is readily discernible.

The number of logs cut can of course be entered up in a memorandum book each night as the "counts" are given in by the men from each gang, but these should be transferred next day to a more pretentious book for permanent reference, and should be so ruled as to show exactly the amount of cutting and skiddng done by each gang, as well as the total cutting and skidding for each day. Specimen "C" will give an idea of this, though lack of space prevents the various kinds of timber which may be cut in a particular camp being shown in the illustration.

Specimen C.

Gang 1	Sept 1	Sept. 2	Sept. 3	Sept.4
Pine cut	10			
Pulp cut	160	200		
Cedar cut				
Total skidded	165	190		
Gang 2				
Pine cut				
Pulp cut	200	200		
Cedar cut				
Total skidded	195	200		
Gang 3				
Pine cut	10			
Pulp cut	175	200		
Cedar cut				
Total skidded	180	200		
Gang 4				
Pine cut				
Pulp cut				
Cedar cut	100	100		
Total skidded	95	100		
Gang 5	Sept. 1	Sept. 2		
Pine cut				
Cedar cut				
Cedar cut	100	100		
Total skidded	95	100		
Totals				
Pine cut	20			
Pulp cut	535	600		
Cedar cut	200	200		
Skidded	710	790		

The record of logs hauled and shipped can be kept in a similar way though, of course, the totals of each kind of timber handled each day need only be given.

In regard to keeping a weekly or monthly account of the food consumed by the teams, guesswork has to a large extent to be relied upon. The only way to keep an absolutely accurate check would be to have the hay, oats, etc., weighed as they leave the granary or storehouse. This, whilst ensuring accuracy would be a cumbersome procedure and the amount of labor which it would entail would more than counterbalance any benefits which would accrue from the practice. It is only possible to estimate the amount used and the amount on hand, and a competent stableman can usually come somewhere near the mark.

In this article the writer has not attempted to lay down any hard and fast rules as to how the shanty books should be kept, but has merely offered a few suggestions which he hopes may be helpful in leading to accuracy with simplicity.

C. A. Lyford & Co., Forest Engineers, Board of Trade Building, Montreal, have commenced field work on a forest survey of a portion of the limits of the River Ouelle Pulp and Lumber Company, at St. Pacome, Que.

The Men Who Get the Formanships

An Incident of a Lumber Camp which shows how the Demands of Business Determine the Success of Employees

By Guy Cramer

THE Old Lumberman had been talking. Now he had slowly refilled his pipe and touched the flaming match to the tobacco-filled bowl. Logging days of years ago had been his theme. He had listened patiently, too, to the clatter of the drummer who sold firearms "out of Boston" and the sage expressions of "business of to-day" by the young salesman who carried clothing samples from a house in New York.

But as the Old Lumberman again showed evidences of finding his tongue the "general room" in the little inn of the northern New Hampshire town—a village which crowded close on the timber reaches that send their volume of raw material down to the grind of the paper mills along the Androscoggin River—took on a veil of silence that gave the crackling of the spruce logs in the fireplace the sound of firecrackers in early July.

"Well, the effect this here called 'business' has on people is certainly various and peculiar," was his rather meandering comment, as his deep-set eyes seemed to be searching back through the years that had gone. And then he volunteered this personal experience—an experience which, shorn in part of his vernacular, speaks a homely but truthful sermon to every man who to-day gives his efforts in the cause of business.

"You may know," he began slowly, "that years ago I run a sawmill up on the Androscoggin. I'd knocked around the woods so long that I could talk the tree language. I knew 'em from root to leaf, and me and the woods was familiar friends and each of us was good enough company to keep the other from gettin' lonesome. 'Two is company' went every time with me and the forest, no matter whether it was summer with its green or winter with its cold and snow. Then I settled down to saw-millin'. Well, sir, I had one fellow that took a place with me when I set the first saw to buzzin' His name was John—he had another name, but John can do for the purposes in hand.

"Well, we sawed some there, I can tell you. John had been with me for nineteen years, workin' around the mill steady all the time, when I took on another new chap. This fellow was a chap who'd just come up to me, manly like, and said he needed a job and would I give him one. Well, he got the job, as I've said, and, by godfrey, by the end of a year I just felt that I didn't know how I ever got along without him. He was such a real prop to me, learned so much about the business and handling things so fast in just the way I wanted 'em handled, that I figured we'd just get up to date and have a 'foreman.' So, I crowned Bill—that name means just as much to you folks as his whole name would—with that there title and told him to live up to the job and be the boss of the men.

"I saw a change in John, all right, in a few days. He went around about his work, mind you, just about the same as ever. But he did it just as if he'd crawled into his shell, stuck there and was carrying the shell around with him. See? One mornin' he come to me.

" 'Say,' he says, 'I've worked faithfully for you for twenty years, ain't I?'

"I said he'd figured right.

" 'An' I've done my work steady?'

"Again I wagged my head up and down.

" 'An' I've stuck to you loyally?'

"I give him another nod, found my tongue and said: 'You bet you have, John, and I appreciate it!'

"He stopped me right there. 'How can you say that,' he broke in, 'when you put over my head a man who's been here only 'bout a year?'

"Now, when I seen John goin' around in his shell I'd sort of been figurin' that I'd have to explain in some way, and smooth down his fur and coax him out again. But I wasn't quite as prepared as I thought I was when the showdown come thus rather unexpectedly sudden. Finally, I jus said: 'Now, John, that's all right; you go along and everything'll be all right. By the way,' I added, 'I think there's a drive of logs just come down this morning and being held about a mile above; I wish you'd just run up and take a look around.'

"He went and some time later come back.

" 'They're in,' he said, short like.

" 'Well,' I said, 'what kind of logs be they?'

"He looked at me a minute and replied: 'I didn't notice that.'

"I wanted to keep him busy, so I said: 'Well, I wish you'd run back and find out.'

"He went and got back with the report that they was poplar, chiefly.

" 'And who're they from?' I asked.

"'Well, now, I just didn't find that out,' was John's reply, and he had that blank look again.

"'Just run up again and see, will you?' I asked. I looked at John with a little meaning that time, but he was off again. Pretty soon he came in with the news that they was of Higgins' cutting.

"'And what length are they cut in?' I asked.

"It was the same old story—John hadn't 'noticed that.' So back he goes again at my askin'. His next appearance brought the word that they'd average about twelve to fifteen feet. Then I had my idea.

"'Well, John,' I said, 'you've traveled right smart now and you must be purty tired; so just sit down here and smoke this cigar,' an' I handed him a roll of tobacco. Then I sent for Bill. He come in lookin' alert and eager.

"'Say Bill,' says I, 'I think there's a drive of logs for us about a mile above, and I wish you'd run up and look around.' Bill was gone in a minute. I kept John smokin' away until Bill got back.

"'Well,' I said, as he come in, 'what'd you find?'

"'The logs is there, all right,' Bill reported.

"'And who're they from?' I asked.

"'Why they're from Higgins, they're about all poplar and they run from twelve to fifteen feet, as I see 'em.'

"There was the whole story in one wad—all the information handed over in one lump! See? And Bill hadn't traveled four times to get it, either. 'All right, Bill,' I said; an' he disappeared out to where the saw was singing its way through the timber.

"'John, I said, turnin' to him, 'I guess you'd better go back to work now; you're rested and everything'll be all right.' And John went. He saw the point. He saw why Bill got the foremanship.

"So, I say, the effect of this thing called 'business' on people is certainly various and peculiar. The Bible talks about them as has ears but hears not, and of those who has eyes though they're blind as bats. And that's gospel truth, all right. It's the fellow who knows and what takes pains to know and uses his ears and his eyes and his brains in learnin' to know, that gets there. You got to apply yourself, I tell you, and think. And it's the fellow who does that as gets the foremanships. And I guess that's about as true in your big cities and in your business concerns to-day as it was in saw-millin' upon the Androscoggin. Ain't it, now?

"I guess it is," admitted the Boston drummer meekly. But, broken only by the striking of another match by the Old Lumberman, the strained silence was almost painful as each member of the circle about the fireplace involuntarily turned his eyes inward and took a mental inventory of himself.

And no man summoned courage sufficient to inform his neighbor as to the result.

Would you?—"System."

Woodworking Progress at Huntsville

Rapid Growth of the Muskoka Wood Manufacturing Company—Modern Facilities and business Ability Produce Successful Result

At the town of Huntsville, Ont., is located one of the most interesting and progressive woodworking institutions to be found in Canada. The Muskoka Wood Manufacturing Co., which enjoys a business of extensive proportions in all parts of the country, is the direct successor of a small industry which was started in a little factory some time in the early nineties. The factory was fitted with woodworking and iron repairing machinery, and was located on King William street. This little company ran along for two or three years without showing any indication of unusual prosperity or growth. Its principal output was broom handles.

In the early part of the year 1901, an important change occurred when the factory and equipment were purchased by Messrs. Hanna and Hutcheson Bros., a well-known mercantile firm of Huntsville, and a determined effort was put forth to develop a large business Results were not long in making themselves shown, and in March, 1902, it was necessary to secure a better site. This was found on the shore of Huntsville Bay, where a lake frontage and piling yard were obtained, occupying about fifteen acres. The factory was then enlarged and the company was incorporated under the name of the Muskoka Wood and Manufacturing Company, Limited.

One of the first steps was to erect a large and modern sawmill, together with a factory for the manufacture of flooring, handles, dowels, chair parts, and other articles of woodenware. A better site than the one thus secured would be difficult to name in Canada. Navigable lakes and rivers enable the company to bring logs from their own limits at a minimum of cost, and to place the finished product on railway cars or vessels without moving from their own premises. Their eastern boundary is the main line of the Grand Trunk Railway, from which two main switches and seven spurs run through their yards, so that they have every convenience for prompt loading and shipping.

Considerable enlargement and improvement has taken place since that date. The floor space of the factory has been doubled, dry kilns have been erected and storage sheds and modern equipment throughout the mill and factory have made it possible for the company practically to double their capacity within the last few years.

An interesting summary of the operations of the company may be secured from the following figures, which represent the annual output of the mill and factory: Lumber, pine, hemlock, mill stuff, hardwood and spruce, 6,000,000 feet; dressed softwood lumber, and dressing in transit, 3,000,000 feet; hardwood flooring, 2,500,000 feet; lath, 2,000,000. The product of their factory also includes curtain poles, handles, dowels, chair parts, cedar telephone and telegraph poles, cordwood and hemlock tanbark.

The plant of the company includes a power plant 40 feet by 40 feet, and an excellent fire fighting equipment.

The company carry in stock from 2,000,000 to 6,000,000 feet of lumber in their yard, and from 300,000 to 500,000 feet of hardwood flooring in their storehouse. Their "Red Deer Brand" of kiln dried hardwood flooring is manufactured with the latest improved class of machinery. It is all jointed, end-matched, steel polished, bored for secret nailing, and bundled. It is known in all parts of Canada, and

Muskoka Wood Mfg. Co.'s Mill; view from yard

Muskoka Wood Mfg. Co.; bird's eye view of plant has an extensive sale in the British Isles. The standard widths are 1½, 1¾, 2, 2½, 3, and 3½ inches, and their standard thicknesses are ⅜, ⅝, 13/16, and 1⅛ inches. The birch of Muskoka and Parry Sound make a splendid quality of flooring. It is claimed, in fact, to be the best for this work upon the American continent.

So long and intimately have the members of the company been associated with the districts of Muskoka and Parry Sound, that they are able to make numerous advantageous purchases of timber lots.

The officers and directors of the company are: R. J. Hutcheson and W. E. Hutcheson, of Huntsville; Wm. Hanna, of Port Carling, Muskoka; Dr. W. L. Hilliard, Waterloo; Dr. J. A. Hilliard, Berlin, and T. S. Parkinson, of Huntsville, secretary-treasurer; Mr. R. J. Hutcheson, who is president and managing director, has been in the lumber business for twenty-five years. The successful organization of the company is due to his efforts, and its continued success is also the result of his careful oversight. Mr. Hutcheson's business ability has been frequently recognized by his fellow townsmen, an indication of which is afforded by the fact that he was re-elected this year to the important position of president of the Board of Trade, of the town of Huntsville.

Concise Lumber Book-keeping Method

Synoptical System which Shows at a Glance Just How the Firm Stands — Practical Forms for Orders and Invoices

THOMPSON LUMBER COMPANY
Per E. W. Thompson.

THE success or failure of a lumber company depends so intimately upon the bookkeeping system and the bookkeeper that the subject of bookkeeping is one of great concern to all in the business. The system which is explained in the accompanying illustrations, and in the following article, will be read with interest and benefit, inasmuch as it contains the essential principles of what is perhaps one of the most concise and at the same time one of the most thorough systems which can be adopted. While this system is in use largely by wholesale lumber firms, it can, with a few modifications, be adapted to the other branches of the trade and industry.

Briefly speaking the system is one which shows at a glance, at any time, the exact financial situation of the firm and the results of its business for the day, the week, the month or the year.

If the books are properly kept according to this system the sum total of the debit entries will be at once shown to equal the sum total of the credit entries. Also the sum total of the credit balance is readily seen and shown to be equal to the sum total of the debit balances. This is the natural proof that the books have been correctly kept.

The accompanying illustration of a synoptic page shows that the sales for the month have been $1,321. It shows also $200 in cash on hand and $158.21 in the bank. A gain of $5.36 is shown on interest, exchange and discounts over and above what has been paid under these items. The gross profits are shown to be $103.05 for the period. Bills payable are shown to amount to $644.80. Notes in hand—not in the bank—are shown at $390. Office expenses for the period are shown at $5 and wages at $12. If there had been any travelling expenses they would have been shown in the column for that purpose.

These are all simple enough entries, but the advantage of the system is the information which it affords at a glance, covering all the operations of the business. The books can be balanced easily at the end of any desired period, without the necessity for taking off all the balances from the ledger accounts. Much needless work is saved because there are no further cash accounts, bank accounts, interest exchange and discount accounts, merchandise accounts, bills payable accounts, bills receivable accounts or office, travelling and wages accounts to be copied into the ledger. This, as shown in the accompanying example, obviates the necessity for posting fifty per cent. of the items in the ledger and the cash on hand and balance in the bank can readily be seen without having to post the items.

To ascertain the net profits according to this system, it is necessary only to deduct from the gain in merchandise and exchange the amount that has been paid in expenses. It more frequently happens, of course, that there has been a loss on the item of interest exchange and discount. In that event the net profit is obtained by deducting from the gross profits the balance of interest exchange and discount and the office travelling and wages items. The illustration shows that the net profits have been $91.41.

The most distinct advantage of the system is the fact that at the end of each day it is a simple matter to add the columns and ascertain the results of the day's business. The advantage combined with the synoptical review afforded of transactions from day to day over any given period makes the system extremely practical for lumber companies.

The system as outlined is so applicable to the wholesale lumber business that it has been adopted in a great many offices throughout Canada. There are many offices, however, which are using much more complicated systems and which could get along well with a system similar to this. The forms used in the system are manufactured ready for use and any firm which wished to look into the advisability of using it could obtain the address of manufacturers

who would supply them with the forms by writing to the Canada Lumberman.

The illustrations, of course, are filled in with imaginary amounts, which have been made as simple as possible in order to make them clear. The two illustrations of invoice forms work in in a measure with the system outlined. One shows the order form which is sent to the mill by the wholesale firm and the other shows the invoice form which is sent to the customer to whom the lumber has been sold. Duplicates of these are kept by the wholesale company in separate books. The folio number is the same for both the order and the invoice form. The terms of payment are clearly shown and the particulars of the order and details of shipment are entered. By this means it is an easy matter to keep track of all business transacted and so simple is the method that there is little or no possibility of disputes arising about the terms of the order.

Pros and Cons of Reciprocity

Views of Lumbermen on the Tariff

An Ottawa despatch says that Mr. J. R. Booth, the well known lumber operator, is absolutely opposed to reciprocity. "It would be the worst thing that ever happened to the country," is his expression of opinion.

That there will be an immediate and large increase in the manufacture of paper and pulp in Canada for trade to the United States as a result of the American tariff changes affecting these commodities, is the opinion of Chester W. Lymann and R. Pagenstacher, officials of the International Paper Company, and of the Manufacturers Paper Company respectively, the two leading paper manufacturing concerns in the United States. They were in Ottawa recently investigating conditions in regard to the paper industry. Mr. Lymann stated that the present exports of pulp and paper amounting last year to about 60,000 tons will probably be more than trebled within the next twelve months. The Manufacturers Paper Company is looking over the ground in Canada with a view to establishing manufacturing plants on this side of the line.

At the Liberal Convention at Amherst, N. S., Mr. Tucker, an enterprising young lumberman, made a practical speech in favor of reciprocity. He pointed out that the British market would only take spruce deals of the best quality. Hemlock was practically debarred from the market on the other side of the Atlantic. No laths could be sold in the British market, no inferior lumber of any kind could be disposed of to the English buyer. Such products that meant much to the lumberman had to be sold in the American market or burnt as waste material. It was the American market or no market at all. Lumber operators who catered solely to the English market burnt a tremendous amount of material that could be made into laths and boards. As lumbermen they realized that this material should be utilized and if the reciprocity pact went into force, a big market could be opened for the by products of the saw mills of this country. Mr. Tucker stated that despite the heavy duty he was selling a great quantity of such products to the United States. He got the same price as his American competitors but his customers charged him with the duties paid which this season already amounted to over $2,000. As this matter vitally touched his pocket he was for reciprocity. The removal of the American duty would be an incentive for all the large operators to utilize what is now too often used as waste material, as manufactured products and with a steady market the small operators would receive a higher price for their cut than under the conditions that prevail at present for the simple reason that more marketable products would be obtained from the log. More employment would be furnished for men and better conditions prevail all round.

A Portland, Oregon, despatch says:—While it is impossible to foresee what will be the effect of the Canadian reciprocity agreement on the lumber industry in Oregon and Washington until there is a practical application of its workings, it is the consensus of opinion among Portland lumbermen that the lumber trade, especially of the Columbia River district, will not suffer in the least. By some it is declared, on the other hand, that if there is any effect upon conditions in this district, it will be for the benefit of the trade.

It is pointed out that there are fewer mills in operation in British Columbia than there are in Oregon and Washington, compared to the amount of standing timber. Added to this condition, the British Columbia plants have been understocked virtually all the time that the mills in Oregon and Washington have had a surplus stock. With a comparatively less number of mills, and with stock kept low, the operators in British Columbia have been supplying a local demand almost entirely.

The result is that lumber prices in British Columbia have been much higher the past two years than in Oregon and Washington. By the elimination of the duty of $1.25 a thousand feet through the reciprocity agreement it is evident, declare Portland lumbermen, the difference on lumber prices will be slight so far as American shippers are concerned, but, on the other hand, an opportunity may arise which will make it profitable for lumbermen of Oregon and Washington to compete with the millmen of British Columbia for trade north of the boundary line.

Local lumbermen hold that as long as the demand from the interior part of Western Canada for lumber continues brisk, due to the thousands of people who have flocked to Alberta in the past few years, the reciprocity treaty cannot have any serious effect on the industry in Oregon and Southern Washington. It is also asserted that if the British Columbia mills seek trade relations with California or foreign markets, lumbermen of this territory will be able to compete with them to good advantage.

Standardization of Sizes

President Griggs, of the National Lumber Manufacturers' Association, has initiated a campaign in behalf of universal standard of sizes of lumber. The argument is convincing and unanswerable. The standardization of sizes in practically every line of industry was undertaken many years ago, and the lumber trade of the country should make a start in this direction at once. Each district association can lend its influence to attain this result. If Mr. Griggs is able during his incumbency of office to bring about even partially this reform he will have done more for the industry as a whole than has been accomplished in any other single step taken in the direction of standardization.

Seasoning Wood by Electricity

The following item from a British technical paper concerns a new process of seasoning wood by electricity in France:

A large tank is filled with a solution containing 10 per cent. of borax and 5 per cent. of resin, with just a trace of carbonate of soda. In the bottom of the tank is a lead plate which is electrically connected to the positive pole of the dynamo. The timber to be treated is stacked on this plate, and when the tank has been filled another plate is superimposed and connected to the negative pole of the dynamo. When the current is switched on it passes through the stack of wood between the two plates, and in its passage it is said to drive out the sap in the timber and deposit borax and resin in its place, completely filling up all the pores and interstices. When the process is completed the timber is removed and dried, after which it is ready for use. It is claimed that the timber submitted to this treatment, no matter how green it may be, becomes completely seasoned.

Nearly one-third of California is forested and the standing timber measures more than 381,000,000,000 board feet, which has an estimated market value of $700,000,000. Government reserves cover 27,000,000 acres, about 11,000,000 of which are timber land, 8,500,000 acres being privately owned. In 1910 there were 738 brush, grass and forest fires, burning over 482,563 acres of land and destroying timber to the value of $601,000.

British Columbia's Supplies of Timber

Over Two Hundred and Twenty Seven Billion Feet of Standing Timber—Influences Which Will Tend to Increase the Annual Cut

By Roland D. Craig

A Stick of Spruce, Graham Island, B. C.

THE average traveller going through British Columbia on the Canadian Pacific Railway carries with him the impression that it is a country of wild rugged mountains and rushing waters, and he wonders where the magnificent forests and productive farms which the Province claims are to be found. The only forests he sees have either been cut over during the construction of the railway, or have since been burned through the negligence of the railway and the Government.

If, however, he is fortunate enough to be able to leave the main line of travel and take a cruise up the coast among the numerous inlets and islands, or follows up the big water courses of the Fraser, and the Columbia Rivers, he will become convinced that British Columbia possesses a wealth of timber which can hardly be equalled by any other province or state in America. He will be impressed most by the heavy yield per acre, which frequently runs from one hundred to two hundred thousand feet per acre, and by the long clear boles of the trees which indicate exceptional quality.

According to the most reliable estimates, fully one-half of the timber suitable for the manufacture of lumber in Canada is to be found in this one province.

Various estimates have been made of the standing timber, but the following table published in 1910 by the Royal Commission of Inquiry on Timber and Forestry gives the most authorative estimate, as it was arrived at after careful inquiry from the best sources of information:

Tenure	Acreage	Stand B. F.
Vancouver Island Crown Grant Timber	318,000	11,130,000,000
Mainland " " "	552,000	5,520,000,000
E. & N. Railway " " "	375,000	5,380,000,000
Timber Leaseholds	619,000	12,380,000,000
Special Licenses	9,000,000	108,000,000,000
Mill Timber on Pulp, &c. Leaseholds	387,000	4,640,000,000
Total	11,251,000	147,050,000,000
Reserved Timberland	3,750,000	45,000,000,000
Total	15,001,000	192,050,000,000

To this should be added a quantity of pulp timber which will be equivalent to at least 10,000,000,000 b.f. and the timber enrolled by the Federal Government in the forty-mile strip along the C. P. R. which the writer estimates as follows:

	Acreage	Stand B. F.
Leased Timber—		
West of Cascade Range	182,874	6,500,000,000
East of Cascade Range	425,600	8,500,000,000
Reserves, Crown Granted Lands, etc.	2,000,000	20,000,000,000
Total	2,608,474	35,000,000,000

The total area carrying merchantable timber at the present time is, therefore, about 18 million acres, and the stand 240 billion feet.

This does not include all the land which is producing wood, for throughout all parts of the province, but more especially in the interior, there are vast areas on which the mature timber has been cut or burned, and where there are excellent stands of reproduction, and I think that altogether the typically forest land is not less than 30 million areas.

Both the Federal and Provincial Governments have wisely followed the policy of lessening timber holdings rather than selling them outright, so that up to the present time less than ten per cent. of the timberland has passed from public control. About sixty-five per cent. is held privately under various forms of lease which, besides paying an annual ground rent, is required to pay a royalty of 50 cts. per M when cut. It is estimated that about twenty-five per cent. is still held in Government reserves.

Aside from the interest reserved in the standing timber in the form of royalty, this policy has enabled British Columbia to secure without hardship to the lumbermen a larger forest revenue than any other province or state on this continent, and the second highest total revenue of the Canadian provinces in spite of the fact that the population is less than 500,000.

Nowhere have I seen natural forest reproduction so successful from the standpoint of species, density and rate of growth than on the Pacific slope, and all that is required to produce a new crop is protection from fire.

In Europe forest lands raise on the average from 200 to 400 board feet per acre per annum, and without fast growing species and propitious climate, there is no reason why our forests should not produce 250 board feet per acre, allowing for a hundred year rotation. In mature stands, the growth is of course offset by decay, but I estimate that there will always be 20 million acres of immature forests which should produce annually under good management, five billion feet.

The value of the asset which British Columbia holds in her timberland is seldom realized. During the year 1909 the Provincial Government secured the following direct revenue from the timberlands under its control:

Crown Grant Taxes	$ 95,712
Leasehold Ground Rent	77,473
Special License Ground Rent	1,983,015
Royalty	264,544
Cordwood	494
Scaling Fees	19,115
Transfers	7,982
Handloggers' Licenses	1,625
Total	$2,449,960

The total forest expenditure for the fiscal year 1909-1910 was only $91,072, which leaves a net revenue of approximately $2,360,000.

With the survey and thorough cruising of the licensed lands there will be a reduction in the number of licenses and therefore of the ground rent, but the increase in the cut from year to year will tend to keep the revenue over the $2,000,000 mark for many years.

The present annual revenue represents only a small part of the value of the timber to the province, for, aside from the royalty, every thousand feet cut in the province means the expenditure of at least $8.00 for wages, supplies, etc.

The capital value of the total stand may, therefore, be conservatively placed at $1,990,000,000, figuring on the following basis:

50c Royalty of Leased and Licensed Timber	$ 70,000,000
Money Spent in Manufacture	1,920,000,000
	$1,990,000,000

The annual growth can safely be said to be worth $50,000,000 to the province.

These figures of course make no allowance for loss from forest fires or careless exploitation, and it is unbelievable that the people of British Columbia will long tolerate the waste which has heretofore been permitted through lack of effective patrol and general ignorance of the importance of forest protection.

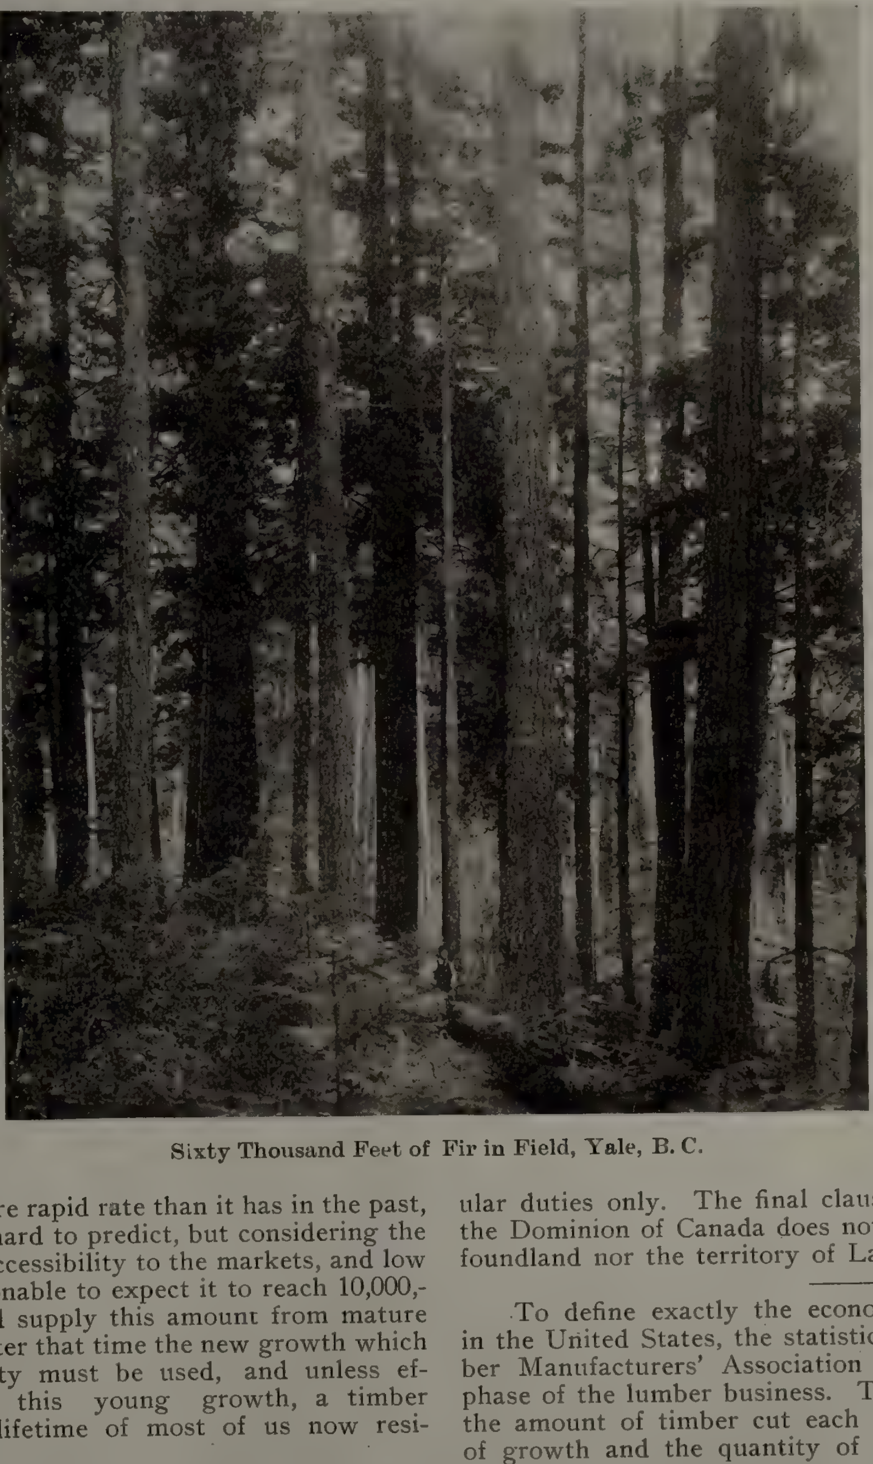
Since the cut at the present time amounts to a little less than one billion feet per annum, it might be deducted that there is no danger of the timber resources ever being depleted. The same has been said of the forests of Ontario and the Lake States, and we know their history. It must be remembered that the lumber and pulp industries of British Coulmbia are in their infancy, and that conditions are so changing that it is doubtful if even our

240 billion feet will be able to supply the demand which will be made for very many years. The centre of timber production is moving west in both Canada and the United States. In 1900 Washington was sixth among the States as a lumber producer, and since 1909 she has been first. This change is due to a better appreciation of the qualities of the Pacific timbers, increased transportation facilities, and decreasing eastern supplies. The wonderful agricultural development of the West has also been an important factor.

The impending change in the United States tariff will have a stimulating effect on the British Columbia lumber production, for though our home markets have been open to American competitors, a duty which practically excluded our common lumber from United States markets has been maintained. There is now every indication that even if the reciprocity agreement is not ratified, public opinion will force the removal of the duty on lumber.

British Columbia lumbermen have been greatly hampered by lack of adequate transportation facilities, but the building of the Grand Trunk Pacific and the Canadian Northern Railways will, besides opening up the northern part of the province, furnish a much needed competition, and result in better service and reduced rates to the the markets on the prairies. The opening of the Panama Canal will also open up the markets of the Eastern United States and Europe, which the long haul around the Horn now precludes, and in this trade British Columbia shippers will then have an advantage even over the Pacific States since interstate commerce is confined to American ships which are few in number, and on account of their monoply charge very much higher rates than the tramp vessels which may be used by British Columbia shippers.

The rapid depletion of accessible timber in the United States is a fact which can no longer be denied, and though the use of inferior material may for a time stave off an actual timber famine, Americans make no secret of the fact that they must depend more and more on Canada to supply their ever increasing demand for forest products, and already many large American firms such as the Weyerhauser interests, Brooks-Scanlon Lumber Company, Michigan Pacific Lumber Company, and many others have acquired large holdings in British Columbia and are commencing operations on a large scale. In addition the wonderful development of the prairie provinces, and the agricultural districts of British Columbia is causing an increase in the demand for lumber which our forests will have to meet.



Sixty Thousand Feet of Fir in Field, Yale, B. C.

It is apparent therefore that the cut must increase at a much more rapid rate than it has in the past, and what it will be in ten years is hard to predict, but considering the superior quality of the timber, its accessibility to the markets, and low price of stumpage, it is not unreasonable to expect it to reach 10,000,000,000 feet per annum. We could supply this amount from mature timber for twenty-five years, and after that time the new growth which will be inferior in size and quality must be used, and unless efforts are made now to conserve this young growth, a timber shortage is in sight during the lifetime of most of us now resident in the province.

It is the duty of Governments to look beyond the present, and to provide for the future welfare of its citizens, and there is no doubt that the present protective system will be greatly improved as public opinion demands it, and that British Columbia will for many years maintain a prominent position as a lumber-producing province, and if Governments and lumbermen work together with the object of maintaining a constant growing crop of trees there need never be any reduction in the present revenue to the province, or the profits to the lumberman.

Practical forestry in British Columbia is a very simple matter. Throughout the greater part of the Province it is only a matter of fire protection. Nature supplies the reproduction, and we should be able to protect it.

Application of Pulpwood Provisions

A communication recently received by the United States Consuls in Canada from the Department of State of the United States at Washington contains instructions in regard to the application of the act to promote reciprocal trade relations with Canada, approved on July 26.

The instruction refers to section 2 of the act, with regard to wood-pulp, and sets forth the conditions necessary to obtain free entry of the articles enumerated in this section, viz., pulp of wood, chemical, bleached or unbleached; news print paper, and other paper and paper board, manufactured from mechanical wood-pulp or from chemical wood-pulp, or of which such pulp is the component material of chief value, colored in the pulp or not colored, and valued at not more than four cents per pound, not including printed or decorated wallpaper.

To obtain free entry of these articles, the exporter must declare on the invoice that the articles are the product of Canada, and that their exportation is not subject to any "export duty, export license fee, or other export charge of any kind whatsoever (whether in the form of additional charge or license fee or otherwise), or any prohibition or restriction in any way of the exportation."

It is further set forth that the free entry of wood-pulp, paper and paper board, applies to manufactures from wood cut on any lands, public or private, of the provinces or territories of Canada, except the provinces of British Columbia, Ontario, and Quebec. Upon the last three, the limitation is made to wood cut on private lands; and New Brunswick is only included in the provision until October 1, 1911.

Printing paper, valued at 3 cents per pound or less, and wood-pulp, which are the products of wood cut on the crown lands of Ontario and Quebec, or on the provincial lands of the province of British Columbia lying west of the Cascade mountains, or on the crown lands of New Brunswick on and after October 1, 1911, will be subject to the countervailing provisions of the tariff act of August 5, 1909; but such paper, valued at more than three cents per pound and not more than four cents per pound, will be subject to the regular duties only. The final clause of the instruction mentions that the Dominion of Canada does not include the crown colony of Newfoundland nor the territory of Labrador.

To define exactly the economic status of the lumber industry in the United States, the statistical committee of the National Lumber Manufacturers' Association is delving into every branch and phase of the lumber business. This committee will attempt to learn the amount of timber cut each year, where it is used, the amount of growth and the quantity of timber left standing after the cuttings the made. They hope to offset at least some of the irresponsible statements frequently made in the public press concerning the wasteful devastation of the timber area. The problem is not so much how much is used and how much left standing, so far as this committee is concerned, but how much of the timber on lands cut over finally finds its way to the markets, and how much is wasted. When sufficient progress has been made by this committee, their findings will be reported to the executive committee of the National association.

A Modern Plant of the Ottawa Valley

Fine Lumber Manufacturing Equipment of the Colonial Lumber Company at Pembroke—Capacity of 160,000 Feet Per 10-Hour Run

Colonial Lumber Company, Pembroke, Ont.—View of Sawmill from West.

THE average visitor to Pembroke, Ont., is not apt to gain anything like an adequate conception of the volume of business transacted in the town. Looking along Pembroke street, where most of the retail business is transacted, he is apt to be pursuaded that he is in a handsome and prosperous rural town in which the inhabitants are not in any particular hurry about anything and where all are rather well satisfied with the existing state of affairs, says the Pembroke "Standard." There are smart and well stocked stores with fine assortments of goods and these seem to be well patronized, but they do not convey any fair idea of the great great volume of business with which Pembroke has to be credited annually. The real industries of the town are so scattered in different quarters that they do not intrude themselves upon the attention of the casual visitor.

A Splendid Sawmill

On the water front, near the C. P. R. station is the large mill of The Colonial Lumber Company, which takes an exceptionally prominent place among the great industries of the Ottawa Valley. On this site extensive lumbering operations have had their headquarters for upward of thirty years from the time when Messrs. A. & P. White were among the leading lumber firms doing business on the Upper Ottawa and its tributaries. Five years ago the original firm was bought by The Colonial Lumber Company of Pembroke, which is now composed of E. J. Chamberlain, President, who is also Vice-president and General Manager of the Grand Trunk Pacific Railway; J. W. Smith, Vice-president; W. R. Beatty, Secretary, of Pembroke; G. E. Fauquier, Director, railway contractor of Ottawa; and the Estate of R. W. Gordon.

The purchasing company rebuilt the mill in the winter of 1905-1906, and so equipped it that it now ranks as one of the most efficient and up-to-date lumber mills in the Ottawa Valley. Of course the output is mainly pine, but spruce, ash, basswood, hemlock and tamarac are included in its output, while oak, birch and other woods are among the important assets of its extensive limits.

An Elaborate Equipment

The mill as it now stands contains one double cutting band saw with gunshot feed and steam set works; a twin circular saw for slabbing, and a circular gang saw for cutting the cants for the twin slabber. This gang includes fourteen saws cutting from one inch up to two inches in thickness. It will cut cants up to 10 inches and is especially adapted for the manufacturing of lumber from small logs. The equipment also includes a slab resaw.

Among the smaller machines in the mill are two-saw edgers, a three-saw edger and a set of slash saws for cutting the slabs into lath and picket lengths. The plant is also equipped with three picket mills and one lath mill, including the necessary saws for trimming lath, etc. The logs are fed into the mill by two separate jack-ladders.

The mill is driven by one engine of 450 horse power and a small engine of 50 horse power, besides a small engine for saw-filing.

The boiler house contains five 125 horse power sawdust oven boilers and one Dutch oven boiler, all of which are fed automatically with sawdust collected from all parts of the mill.

The whole property has an up-to-date and thoroughly efficient system of fire protection. The mill is furnished with a sprinkler equipment on every floor and in the upper yard are two well placed hydrants, which with 1,500 feet of hose can effectively cover every inch of the property.

The lumber is transferred from the mill to the sorting table which is 140 feet from the mill, by a system of live rollers. The sorting table is 200 feet long. From the sorting table the lumber is loaded on cars and distributed to the different yards, one of which is about the mill and the other about two miles below Pembroke and on the line of the C. P. R. The yard capacity is 25,000,000 feet.

The mill refuse is consumed by a burner 25 feet in diameter and 110 feet high.

Extensive Booms for Storage

The company has, at Pembroke, a storage or boom capacity for 140,000 logs, one adjoining the mill property and the other just opposite and bordering Allumette Island. The mill cuts an average of about 2,000 to 2,500 logs or 125,000 to 160,000 feet in a ten-hour shift. Last year it sawed 250,000 logs or 20,000,000 feet of lumber. In addition to this it turns out about 35,000 laths and 35,000 pickets every ten-hour day. It also delivers 15 cords of firewood daily.

The company employ 175 men and boys in the mill and yards and 500 to 600 men in the lumber woods during the season, which usually begins in the latter part of July and lasts until the logs are afloat and ready to drive.

A peculiar feature which cannot fail to strike

Colonial Lumber Company, Pembroke, Ont.—View of Sawmill from East.

Colonial Lumber Company—Sorting Table.

Colonial Lumber Company—Portion of Track 2, Yard 2.

the attention of the ordinary observer forcibly is the tremendous speed with which operations are carried on in this immense manufacturing plant. It is a sign of the times. It means that the task of the lumberman of to-day is not the mere reaping of a fortune from the great pineries by the simplest and least complicated operations. It means that pine is extremely valuable, and that the cost of manufacturing is very high as compared with what it was a score of years ago, and that every square foot of it must be turned to profitable account if the manufacturer would hold his own. The day of cutting down only the great smooth bodied trees up to the first knot or incipient limb and leaving the crooked, small and knotty logs and the logs with punky ends to rot on the ground has forever passed away.

New Methods vs. Old Ones

Old methods could not outlive a single season's operations in these days of lumbering. Good, live, healthy and sound pine is to be found in the crookedest and knottiest log, and it is the business of the lumber mill of to-day to get it out and make the most of it. A big smooth log may have a deep punky defect at one end, or it may be rotten in the centre, but it also may contain many feet of short length clear stuff between the bark and the punky heart, and the lumbermen of the twentieth century cannot afford to let any of that get away.

It is just here that the great double cutting band saw with gunshot feed and steam set works gives the visitor an idea of the real present day manufacture of pine. It costs money to cut that log in the pineries, to skid it, to haul it and drive it, and yet no time must be wasted in getting out of it the small share of really choice lumber which it has finally brought into the mill.

For the cutting of small logs at a maximum rate of speed, the gang circular is an ideal contrivance. Its fourteen discs rip through the slabbed log which comes from the twin circulars, and the whole cut is made, the boards pass over live rollers to the edgers and thence to the carriers which convey them to the sorting table.

On the extreme east side of the mill is the big circular which is used for the cutting of dimension orders for timbers of various sizes and lengths for ship building, railway buildings and in fact an endless variety of purposes requiring square timbers or joists of standard marketable measurements. The logs come out of the boom on jack-ladders and pass out of the south end of the mill accurately cut in conformity with the orders given for them and ready for shipment.

All the machinery in the Colonial Lumber Company's mill, as well as the engine, boilers, etc., were manufactured and supplied by the William Hamilton Company, Peterborough, Ont. The contract for building the mill and machinery and installing the machinery, etc., was also placed in the hands of this company.

Dawn in the Forest

Edith Willis Lynn

Like a grey nun across the eastern hills
  The dawn creeps slowly, in her hand a star.
  The forest stirs to greet her, faint and far
Pulses the music that the vastness fills.
In cloistered columns stands the pine that shrills
Beneath her breath, while like some gate ajar,
  That shadows and the silences unbar,
The night swings backward as the new day wills.
Above the murmur of dim forest ways
  Rises a paean—music's very own—
Clear as the pealing of a convent bell;—
  So sad, so sweet—like love lost or outgrown;—
The forest-loving songsters' matin praise,
  In silvery tones repeating, "All is well."

Twenty-two sawmills in Louisiana, and two in Texas have been closed down, and 8,000 men are idle, on account of the fight over the unionizing of their employes by the Brotherhood of Timber Workers. The wholesale suspension is said to be an outcome of a recent conference of members of the Southern Sawmill Operators

Colonial Lumber Company—"Colonial Row".

DAVEY MACDONALD'S PEAVEY

By Sid Howard

Oh, come all me bold drivers, where'er you be drivin,'
If it's Long Gallop Rapids or Dare Divil's Drame,
Or Widdie's White Water, that witches contrivin,'
Where down in the Cauldron ye can't see for stame.
For sure, I'm aware that yer log's like to leave ye,
But if you drown per peavey
Then you bear the blame.

FIRST of all you must know that Quinze means fifteen in French Canada. Up the Ottawa they leave out the "n" and pronounce it "Kah'z," just as they leave the "l" out of Diable and say "Diab.' " Fifteen tumbling cataracts in crowding, panic-stricken succession, each one a barrier, each one, you might think, sufficient excuse for discovering therein the head of navigation—such is that section of the Ottawa where the mighty river pours through the gnarled Laurentian rock from Quinze lake to Lake Temiscaningue. With three hundred feet of a fall in a distance of twenty-two miles, the Quinze has a head like a mountain torrent, with a weight, a volume and a depth which would shock the wise old schoolmasters deaf and dumb who used to teach that the Ottawa river rose in Lake Temiscamingue. Probably every river where daring men drive logs has its "Devil's Falls," but of all the falls of river-drivers' devils, surely the Chute du Diab,' third fall of the Ottawa Quinze, is the worst. Thirty-five feet sheer drop it has, with a swift, slipping rush immediately above for perhaps one hundred yards, fed in turn by three miles of turbulent, boulder-smashed rapids. Below, the roaring river churns in a gorge with a deep circling eddy, foam-flecked and black, and a tail-race like a mad stampede of gigantic, plunging horses, white with lather, rearing, raging, surging—terrified and terrific. Small wonder the French voyageurs long since named it La Chute du Diable, and little wonder, from the voice of it, that the river drivers of the Quinze, who know it better, still so continue to call it.

A small rock island like the broken roots of a double tooth shows at the verge of the fall at low water in the autumn, dividing the water two-thirds across. Time was when that rock broke through the lip of the fall like a blackened fang, and sometimes great logs which struck it broadside were bitten through, they say, like tooth-picks, or snapped like an old woman snaps a fagot across her knee. The Devil's Tooth they called it, and fifteen years ago that Devil-careless White-Water Association known as the "Quinze Sweep," pulled the Devil's Tooth by aid of dynamite and a little savoir faire.

Old Ben Macdonald, the Quinze foreman, has been a noted figure on the Ottawa for thirty years. He is a man of two hundred and twenty pounds, with a back like a door, a chest like a barrel, and a voice like the Chaudiere. A little rough, perhaps, but when he speaks the occasion is imminent and men jump. From that cavern of a chest words come forth like a storm. He stands over six feet in height, straight and solid, solemn as a mountain. His pock-pitted face is copper colored, and his sparse chin whisker bears out the fact of his Algonquin parentage. But the shape of his face and frame, the square jaw and brows, the bone and brawn—the majestic impression of reserved power—are all indisputably Highland Scotch. In the spring Old Ben takes charge of the Quinze, the most difficult section of the Ottawa to drive, and perhaps the wildest series of rapids in America used by lumbermen. He acts for a subsidiary company formed of all the firms having logs in the waters above. They feed them in at the top, and Old Ben and his half-breeds sweep them all alike down to the sorting booms at Lake Temiscamingue.

David Macdonald was born at the foot of the Quinze, where the Ottawa, calming down after all its fury and confusion, forms the delta at the head of Lake Temiscamingue. His mother was an Algonquin woman. Born and bred, almost, on the logs, it was not strange that the traditions of the river and the ethics of the river code should have grown into the very grain and fibre of him. Since first he could walk he loved to drive the river, to ride along through the boil of a rapid, to leap with caulked boots up the face of the breaking jam and come ashore with his peavey, under the approving eye of his great, taciturn father, may be, who never smiled save when he himself stood in the presence of danger. A make-believe peavey had been among the first of Davey's toys, and as soon as he could walk at all he learned to walk the logs.

Of his eight older brothers, all were river-dogs, all of them were good men, on the logs or rough-and-tumble, and by some freak of cross heredity all were of medium size—which fact, perhaps, was just as well, for the logs ran smaller even twenty-five years ago than in the old days. One hundred and fifty pounds is the best weight for a man on the logs they get out now.

The youngest of the Macdonald brothers, however, was built on his father's plan. A loose, raw-boned lad, he gave promise of filling out to a stature like those giants of the cork-pine days of which his father was a specimen. At fifteen years, straight-legged, big-kneed and broad, his Indian hair chopped off square above his face like a bit of bear fur, the pure Scotch of his father's father showed plain in David's features and in David's ways. Davey was his father's favorite, the secret joy of his hidden heart, and by way of showing him favor and proving his affection he had put him on the river as soon as he was big enough to lift a peavey.

"Shove it to him," he told the men, "make him shoulder his end. He'll be a Macdonald yet." For Old Ben believed in "giving it to 'em tough from the start." He'd been raised that way himself. And so it came, the time they pulled the Devil's Tooth, that young Dave was on the bow crew, as were Donald and Peter, his elder brothers, Ben himself being away up the river with the tail. Big as he was for his age, Davey's peavey stock measured almost as long as himself. A joke of the drive was Davey and his overgrown peavey, a joke which Dave, who took himself seriously, had never as yet quite parried or lived down. A five-foot handle of rock maple, hand split, a dog-hook hinged by a bolt to a lug in the socket, with a duck bill of hammered crucible steel and a solid steel pike driven cold into the heel of the handle—Davey's peavey might have been the weapon of a giant.

The cook had pitched his tent on the west shore at the edge of the woods a little above the Devil's Chute. The wider of the two channels separated the camp from the little rock island at the brink of the falls. Here in the clearing for nearly a week the bow crew clustered about the fire four and sometimes five times a day for meals, and rolled each in a blanket under the sky at night. Some slept wet, others carefully changed to dry socks, and hung their heavy Mackinaw clothes by the fire. Mackinaw will shed rain for twenty-four hours, but proverbially it takes three weeks to dry. Many of the men accordingly disdained to do more than to stand till they ceased to drip. In rainy weather they crowded into a ragged tent, building themselves off the ground with poles and brush. The chief part of the outfit was back with the tail and the hired cook. The bow always travelled light and "toughed it," impressing a cookee and chore boy to "throw de chuck."

Here at the Chute du Diab,' in the course of a long log-running Sunday morning in early June, most of the bow gang being scattered down the river, poking out sidejams and clearing the lower eddies as they filled, here it was that a great half-peeled pine butt crashed full broadside against the Tooth and by some freak of momentum rolled gently up the steep slope and settled like a bagatelle ball in a slight hollow place on the very crown of the rock. Later it chanced that two square timbers drifting together chashed also against the Tooth, and were dashed on it in close embrace. An irregularity at the water's edge, a nub of rock which caught one of the twain but not the other, hurtled the timbers ricocheting and shivering up the slope, to fall like a pair of shears at right angles across the big peeled pine butt bedded in the hollow. That was the beginning—a devil-made skidway with the ends of the skids thrust out in the water, the easier to land fresh logs that came.

And come they did in a steady pour, for Old Ben was shoving 'em in, sending 'em down. A great driver, big Ben Macdonald.

Soon a cap of logs covered the Devil's Tooth like a huge beaver house. Every fresh log that landed braced the skidway with its added weight and piled up fresh hold and lodgment for those that followed. Presently the breast was so high that downward was the course of least resistance, and under the overhanging and submerged skid ends great saw logs and square timbers, sweepings of the Quinze, which ordinarily swing clear and pitch drunkenly over the Chute, now caught, hesitated, and sucked by the pressure of the current, ducked under the skids and locked unseen against the solid rock.

The crew gathering back at the bean hole for first lunch, made guesses as to how high she would climb before she grew top-heavy and fell over the falls. Beyond the reach of peavey, pike or bateau, separated by the racing rush of one-third the river's width at closest, the men could only surmise. No speculation, however, took into considedation that peelel pine butt log, or that crossed and interlocked pair of skids. Instead, therefore, of rearing higher, the jam now proceeded to build up-stream. Fresh logs pressed by the river from behind barred by a flush breastwork in front, ranged full length as if spiked, or sank to the rock.

And so back along the bottom of the river and high above the current grew a long column of matted logs like a wharf, knitted and tied with traverses, held in place by the overwhelming weight of the Quinze. Round logs and timber poured freely down the split and divided river, but always a proportion of them struck the pier head, swung into place and bound like pins to a magnet. Back, back from the falls all morning it grew, a long, cribbed pier, square-ended to the flow of the current, finding footing perhaps on the reef that outcrops at the pitch of the falls.

When the men came crowding back to the "grub pile" again at the noon hour the jam reached back up the left centre of the river for a clear two hundred feet.

"Well, Davey boys," said Joe Cassidy that day, as the men ranged, wet and hungry, around the pile of plates and pannikins, "how's the high-bankin'?"

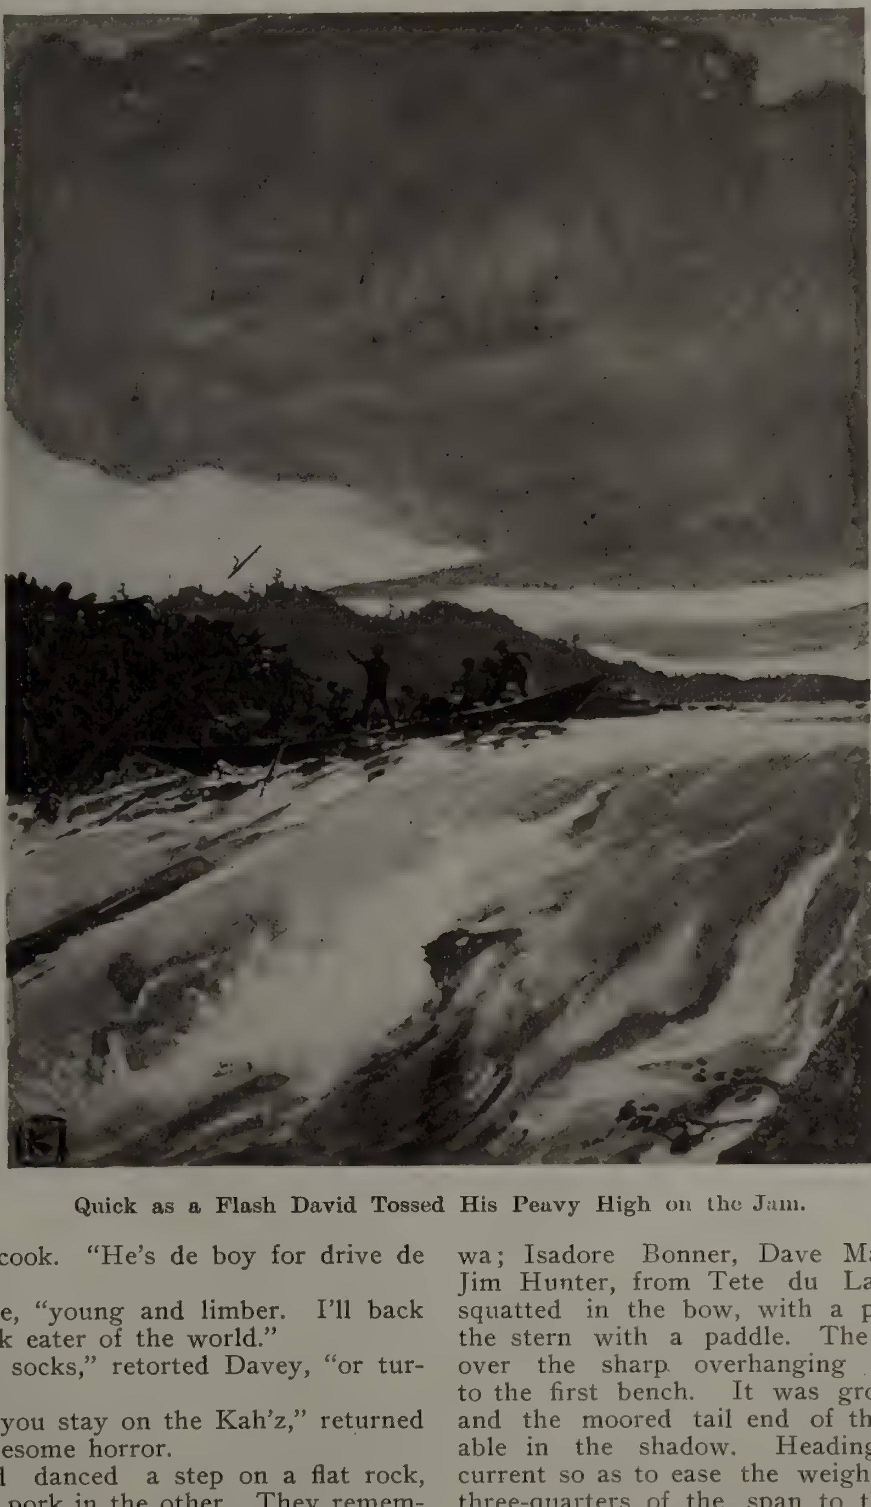
"Pretty good," said Davey. A "high-banker" is a man who shrinks from wading, and as Davey was wet past the waist, the question was obviously a jest.

"How's the wee peavey?" continued Joe, with his mouth full.

"Pretty good," said David, again without expression.

"I'd like to borrow that hook of yours this afternoon," said Joe, with mock innocence, "unless," he added, "you're going to use it yourself."

Davey ate and said nothing, while the men laughed.



Quick as a Flash David Tossed His Peavy High on the Jam.

"Dave's haw right," said the cook. "He's de boy for drive de pork and bean."

"Davey's young yet," said Joe, "young and limber. I'll back Davew agin the champeen flap-jack eater of the world."

"He ain't old enough to pack socks," retorted Davey, "or turpentine, neither."

"You'll git down to it lad—if you stay on the Kah'z," returned Joe, who held rheumatism in wholesome horror.

Davey grinned derisively and danced a step on a flat rock, a tea dish in one hand, a chunk of pork in the other. They remember that little step yet when they tell of that day. His calks dug white pocks in the granite.

"Min' out yer corks, now," Peter, his brother, had advised him, "You'll need dem dis afternoon."

It was heavy, cloud-darkened early June, and the flies were bad. It threatened rain that afternoon, and if only it rained enough the river would rise. Perhaps then the jam would lift, loosen and come away. If it continued to grow like a pier it might get top-heavy with length and fall across the river. In that event the whole drive might hang for a year. The rapids for fifteen miles above were filled with logs.

MacKenzie the bow foreman, who never indulged in banter or trivial conversation of any kind, had been eating beans with his knife steadily for three minutes that constituted his meal time. He rose, put his tin plate on the cook's pile, and lit a pipe. Quietly, without tone of authority, he distributed his men for the afternoon. He was afraid the pier would wing out, and block the river if allowed to build unchecked. Accordingly Dave Macdonald, Joe Cassidy and five others under Peter Macdonald, eldest but one of the brothers, were sent up above to string a boom, and set off over the portage presently, some with axes and rope, some with pike poles and augers, young David in the rear with his beloved peavey. Some boom chains had been left with a bateau at the upper landing.

Three miles up from the falls the river opens out into an expansion of comparatively slack water. Here at a gravel point several hundred feet above the head of the rapids, at the narrowest place available, the men under Peter Macdonald's direction proceeded to stretch a boom from bank to bank. It was no light business. A few boom sticks hung up from the green shore boom of the season before were ready to hand but not nearly enough of them to span the channel. Long logs had to be picked from the drive in the river and poled to shore, squared at the ends with an axe, and bored for the chains with a rusty auger. Soon, too, they ran short of boom chains and resorted to rope and twisted hay wire. Finally, late in the afternoon, all material of every sort was exhausted save fifty feet of line left for towing. The lower end of the string was snubbed firmly to a pine stump on the green bank and the floating boom was straightened out along the rocks and drowned cedars of the fore shore. The bateau had been left moored to the end of the portage, and the eight men climbed aboard. Snubbing their spare line at the upper end of the boom, they began to pole the boat out into deep water. The long stretch of logs chained end to end swung from the bank like a gate on its hinges. Out from the shore a short distance the men took to the sweeps, and the slight current catching the opening angle, the boom closed slowly and steadily across the river. Presently, however, it began to bag with the increasing weight of the current and of the running logs which came drifting against it. Gradually it grew harder and harder to move the bateau.

Alex. Paulson, Joe Cassidy, the Irish Canadian from Mattawa; Isadore Bonner, Dave Macdonald, Tom McBride and big Jim Hunter, from Tete du Lac, sat at the oars; Batiste Tremore squatted in the bow, with a pike pole; Peter Macdonald stood in the stern with a paddle. The line from the boom was passed over the sharp overhanging stern of the pointer and hitched to the first bench. It was growing dusk under the western hills, and the moored tail end of the boom was almost indistinguishable in the shadow. Heading diagonally across and down the current so as to ease the weight of the tow, they gained perhaps three-quarters of the span to the eastern bank. Presently they found that the diagonal course was using up too much of their tether, so they headed now directly for the bank one hundred feet away, and strove to straighten out the slack. But the river had too big a grip.

"Give it to her, boys!" cried Peter Macdonald. "Hooraw! Now pull!"

The boat hung poised in the current as though on the end of a spring cable.

"We'd ought to have three hundred feet more line and a winch," said Jim McBride. "Give us all you've got, Pete, and let's get in where we can pole her. She's too heavy for us this way, altogether."

The end of the tow rope lay under the thwart where the line was snubbed. There was not enough. Peter loosened the knot and paid it out. As fast as the heavy rope went over the stern the spring of the boom took it up, and the bateau crept scarce an inch forward. Soon, indeed, the shore began to drift away from them, the current setting heavier on the eastern side. The boom was backing them out into the centre again, and hurrying them toward the head of the rapids.

"I guess we'd beter go ashore, boys," said Peter Macdonald.

He looked astern, saw how the boom was drifting, and pulled the knot out of the tow rope.

"I tink we'd better hang on to the boom," cried Baptiste from the bow. "I tink I sooner walk ashore on the boom sticks than run La Chute du Diab.' "

"Pull!" cried Peter Macdonald, turning of a sudden. "Give her hell, boys; we're loose!" And he struck out vigorously with his great steering paddle. Fifty feet below, the white splashes of the rapids seemed suddenly to start up from the smooth black slide of the river. They were the first scared leaps of that three-mile stampede to the Devil's Chute. Free from the slower movement of the boom the bateau had swept down like a leaf. Heading up stream and across they steered for shore, pulling with short, swift, splashing jerks. But they gained in the cross direction only. The river bore them slowly down.

"Pull, boys, pull!" cried Peter. "Give it to her!"

"Jesu Marie," murmured Baptiste, his eyes wide; "we can't make it."

The bateau entered the broken water still nearly 50 feet short of the shore. They had been heading bow up stream, and they remained that way of necessity now that nought else remained but to run, as no boat can turn about in a broken rapid. Peter Macdonald had turned in his place and was piloting his end at the bow, picking his course among the boulders as it came to him on the fly. Every black round head and submerged rock had a white wave eight or ten feet below, and by these white signals he chose his path, pulling or prying on the gunwale with the paddle, swinging the bow where the channel seemed clearest, grazing past the stones and avoiding the breakers. Rolling waves rolled high with hissing tops each side of them, but the pointer with its overhanging stem and stern was built for rapids.

"Well, boys," one might imagine Joe Cassidy remarking in the tense, quiet that succeeded the first plunge, "here we are." And there they had to remain and see it out, stem and stern with the current. Landing was beyond the power of man.

In this way they swept down that furious three-mile stretch of broken water above the falls, running the White Surges for the first time in the history of the Quinze. Less than twenty minutes after casting off from the boom, at twilight, they shot into the centre of that short, smooth slide above the chute, where the water sucks deep and swift, and in black silence. The cook's camp stood in the clearing on the west bank. Old Ben Macdonald had come down from the rear by the cadge road, and stood with a group at the fire.

Instantly Peter swung his end of the pointer to the right and turning in his place they heard him shout to the middle men: "Hooraw! boys, pull! We'll land on the jam. Hold her; Hold her!"

The six oarsmen needed no explanations. They were to resist the strength of the river all that by the help of Christ they might, and sidle anglewise fifty feet across the current in an attempt to graze the pier that the jam had formed since the early morning. The current itself was to be utilized to sweep them to refuge. Any one who travels by boat on the Quinze must perforce soon learn the principles of "sheering." The roar of the Chute filled the air. Like a kite on a slant of wind the bateau darted quarter-wise across the channel and grazed the jam.

"Haw right, boys; quick now!" cried Peter, sharply.

Baptiste Tremore caught at the rough-barked pine log with his pike. Alex. Paulson dropped his oar like a flash and laid hold to help. Baptiste in a panic let go and jumped from the gunwale. He knocked against the pike pole, the log peeled and the bark came away with the hook. The thrust of the leap pushed the bow out from the pier and poor Baptiste fell flat on his face. The racing current whisked him away. Joe Cassidy had let his oar slide into the river when the boat first touched the pier. Tom McBride, by habit equally unthinking, had yanked his sweep into the boat. The oars of Alex. Paulson, Isadore Bonner and David Macdonald being next to the jam were useless, having no room to work. Jim Hunter was bending his sweep in a frenzy of splashes to swing the bow back against the pier, but from his place in the extreme stern he had little or no leverage on the current. Peter Macdonald, coolest man in the boat, had jammed his paddle between the logs and was grimly holding the stern.

Quick as a flash, David, his young brother, picked his peavey from the bottom of the boat and tossed it high on the jam. That simple action, done how and when it was, has made his name imperishable as long as logs come through the Quinze.

Joe Cassidy and Isadore Bonner took a chance, jumped, missed and went down. The wrench on the boat was too much for Peter Macdonald's paddle. The blade split and the rest of it came away in his hands. The current got the bow. In a moment the bateau had circled and head on darted to the pitch of the Chute. Paulson, Tom McBride and Hunter sat stooped on their thwarts with their backs to the falls, clinging with their hands. Peter Macdonald stood in his place, in the stern with his broken paddle. David, his younger brother still crouched amidships in the position from which he had saved his peavey.

Below in the Devil's Kettle, the jam crew were tailing logs out of the eddy in the last precious light of the day.

Crouched, sitting, standing—a moment's picture—and the bateau took a leap.

* * *

How they found poor Davey's peavey next morning is of itself a story. How the pier winged out, how it bent across the narrower channel, dropped like a rocket, broke, burst and showered the eastern shore; broke, but sweeping down with the rush of water, tightened, locked and jammed again at the verge of the Chute like a dam, is all set down and ascribed to the inexplicable methods of the devil by the pious Catholics on the Quinze.

Over the bridge of tangled timbers thus made they ventured out on the Devil's Tooth for the first time; and here, the stock bolt up-right, the dog hook fast in a log, and the pike wedged in a crevice, they found a peavey—poor David Macdonald's.

"Saved!—by the jumpin' Jesus!" choked Big Ben the river boss. "Saved his peavey! Poor little Davey—I begrudge you, by God, I do!"

They sunk a charge of dynamite on a slivered pike pole down under the skidway at the base of the rock and went ashore. The devil lost his tooth and at low water you may see the roots to this day when you travel by the Quinze.

Uses of Cedar

The following as to the uses to which cedar is adapted is from a report of the Forest Service:

Western red cedar is the greatest shingle wood in the United States at this time and has held that place for some years, with no likelihood of giving it up in the near future. The average output from this wood alone, and chiefly in the state of Washington, is not far short of 20,000,000 shingles for every day in the year. In 1908 it furnished 63 per cent. of the total shingle cut of the United States. Redwood shingles, made only in California, appear with it in the eastern markets, but they form only one-eighth of the cedar output.

This cedar is extensively cut for poles in Washington and Idaho, and large-size poles of this wood are now shipped to nearly all parts of the United States under the name of Idaho cedar. The very long poles seen in city streets are generally of this wood, because other woods do not afford the necessary length. Poles cut from this species taper regularly, and present an attractive appearance when set in line. Their ability to resist decay likewise adds to their value along streets and suburban roads, where frequent resetting through cement and asphalt is expensive. Country telephone poles are from 20 to 30 feet long, railway telegraph poles from 25 to 40 feet, and those in cities from 40 to 75 feet.

The wood is used for car siding and roofing, positions where great strength is not required.

More is now used in boat building than in the days of the Indian canoes on western waters, but it serves in a different way. It is now a highly finished product, and is worked by skiff makers and yacht carpenters. It provides handsome trim, lining, railing and roofs.

It finds more and more demand as interior finish for houses, stores and offices. Pattern makers use it and it is seen in window and door frames and in sash and doors, in molding, chair boards, stairways, panels and porch work. It fulfills the requirements of outside finish as well as inside, and is being cut into bevel-edge siding in large quantities in many western mills. Cabinetmakers use it for many purposes—the backs and sides of drawers, shelves, boxes and partitions. It is worked into frames and sash for hothouses, as well as sash for ordinary windows.

Its use in cooperage has come down to the present time, and where it was formerly shaped by hand it is now manufactured by machinery into buckets, pails, tubs, tanks and the whole line of similar articles.

Mining Timbers Used in Canada, 1910

Round and Sawn Products Consumed to the Value of $827,337 —Detailed Report Upon Varieties Used in Different Provinces

THE following statistics of the timber used in the mines of Canada in 1910 are based upon reports received by the Forestry Branch of the Department of the Interior from 136 coal and ore mines throughout the various provinces as follows: British Columbia 59, Ontario 27, Alberta 20, Nova Scotia 15, Yukon Territory 9, Saskatchewan 4, Manitoba 2. These represent nearly all the mines using timber. There are a large number of mines in Canada which do not use timber in their operations.

In the tables two main divisions have been made: round timbers and sawn timbers. The round timbers are the small sizes and were used underground as mine supports to give artificial support for insecure roofs or walls, and to protect shafts, drifts and gangways. The sawn timber reported is mostly lumber, together with a small quantity of square timber and was used principally above ground for building breakers, tipples, washers and trestles. A small quantity was used underground for sets, stulls and ventilator shafts.

Including round and sawn timbers, timber to the value of $827,337 was used in Canada during 1910 for mining purposes.

This total is made up of 52,848,000 linear feet of round timber worth $523,338, and 22,305,000 board feet of sawn timber which cost $303,998.

The various species of woods used by mining industries are chosen not because of their superior technical qualities, but because of their cheapness, suitable size and accessibility. Thus fir is the most used mining timber because it grows in the province where most of the mining is done and is easily obtained. Understanding this, it is easily seen why the use of each species is confined to one province. British Columbia used all the fir, Nova Scotia used practically all the spruce, balsam, hemlock, birch, beech and maple; Alberta used almost all the jack pine, larch and poplar.

Quality and Value of Round Mining Timber

Table I. shows by provinces the quantity and value of the round timber used by mines in Canada during 1910.

Table I.

Quantity and value of the round timber used in mines of Canada, 1910, giving average cost and per cent. distribution, by provinces.

Province	Quantity M. Lin. Feet	% Distribution	Value	Average Cost M. Lin. Ft.
Total	52,848	100	523,339	9.90
British Columbia	29,047	55.0	203,597	7.01
Nova Scotia	15,653	29.5	168,142	10.74
Alberta	7,484	14.1	132,900	17.75
Ontario	549	1.2	14,724	26.83
Saskatchewan	105	.2	3,597	34.25
Yukon	10 (1)		379	37.90

(1) Less than one-tenth of one per cent.

The mines of Canada used in 1910 52,848,000 linear feet of round timber, which cost $523,339. This is a cost of $9.90 per thousand.

British Columbia alone used 55 per cent. of this consumption—29,047,000 linear feet, at an average cost of $7.01 per thousand. This is a lower price for round timber than in any other province, and is due to the fact that nearly 20,000,000 feet of this amount was 4 to 6 inch Douglas fir, used by two of Canada's largest coal companies for lagging.

Nova Scotia, using thirty per cent. of the Canadian consumption, is second in importance. 1,653,000 linear feet were used at a cost of $168,142. This averages $10.74 per thousand linear feet, and is, after British Columbia, the lowest price. Spruce five inches in diameter formed a great proportion of this province's consumption.

Alberta used 7,484,000 linear feet, or 14 per cent. of the total. This amount cost an average of $17.75 per thousand. Over 70 per cent. of this was small size lodgepole pine. Spruce made up nearly 25 per cent. and the balance was mostly fir.

The above three provinces, British Columbia, Nova Scotia and Alberta, contain all the important coal mines in Canada, and consumed 98.6 per cent. of the timber used in mining. The remaining 1.4 per cent. was used in Ontario for ore mining and in Saskatchewan and Yukon for small coal mines supplying local demands.

Ontario mines used 549,000 linear feet at an average cost of $26.83 per thousand. Nearly one-half of this was spruce 5-7 inches in diameter; one-third was pine of small dimeters. The remaining one-sixth was tamarac and timber of unspecified species. The mines in Ontario use so far a very small amount of timber per mine as compared with the large mines of British Columbia. Most of the mines are small, shallow, and in the solid rock, so that little timber is required for protection. Also a great number of the mining companies incorporated in this province have not advanced sufficiently in their operations to require any timber.

Saskatchewan has a very small number of coal companies, only one of which sells to the public. 105,000 linear feet were used in this province and cost on the average $35.25 per thousand. The high price of this timber is due to transportation charges, either from the spruce and tamarack belt of northern Saskatchewan or from the Rocky Mountains.

10,000 linear feet of spruce was used by the coal and gold mining companies of the Yukon at an average cost of $37.90 per thousand. This is all native wood and the high cost of this amount is due to expensive labor. The small quantity of timber reported from Yukon is explained by the small number of deep mines. Mining operations do not extend far below the surface, and therefore there is no great necessity for timbering.

Species of Round Timbers Used in Mines

Table II. shows by importance of species, the round timber used in Canada, 1910.

Table II.

Quantity and value of round timber used in mines of Canada, 1910, giving per cent. distribution and average cost per thousand linear feet by species.

Species	Quantity M. Lin. Feet	% distribution	Value	Average Cost M. Lin. Ft.
Total (1)	52,848	100	$523,339	$9.90
Fir	28,268	53.8	198,776	7.03
Spruce	14,417	27.5	179,734	12.46
Jackpine (2).	4,455	8.5	66,751	14.98
Balsam	2,170	4.1	21,215	9.78
Hemlock	1,172	2.3	15,691	13.39
Tamarac	819	1.6	14,102	17.22
Pine	720	1.4	10,234	14.21
Birch	326	.6	4,311	13.22
Larch	74	.1	927	12.52
Poplar	54	.1	848	15.70
Cedar	23 (3)		1,107	48.13
Maple	1 (3)		11	11.00
Beech	1 (3)		11	11.00

(1) The total includes a small amount of lumber not identified by species.

(2) Includes Jackpine and lodgepole pine.

(3) Less than one-tenth of one per cent.

The mines of Canada reported the use of thirteen species of wood in their mining operations.

Fir alone was used to the extent of 53.8 per cent. of the total represented by the thirteen species. 28,268,000 linear feet of fir was used, representing an expenditure of $198,776. This is an average of $7.03 per thousand, which is the smallest price paid for any species. Fir is a very popular wood for mining purposes, particularly in British Columbia, on account of its accessibility and strength.

Spruce stands second in importance, and contributed over one-quarter of the total. 14,417,000 linear feet were used at a cost of $179,734. This is a naverage cost of $12.46 per thousand. The great amount of spruce is due to its occurrence in Nova Scotia, where it is used by most of the coal mines. Although in amount nearly twice as much fir was used as spruce, in value fir was worth only $19,042 more than spruce, due to the difference of $5.37 per thousand feet in the cost of spruce over fir.

Jackpine was the third important species. 4,455,000 feet were used at cost of $66,751. This is an average cost of $14.98 per thousand. The entire quantity of jackpine mining timbers was used in Alberta. Two species of pine are included under jackpine. The one is the true jackpine (Pinus banksiana), and the other is lodgepole pine (Pinus contorta Dougl. var. murrayana). Lodgepole pine occurs extensively on the slope of Alberta and British Columbia, and comprises 90 per cent. of the "jackpine" listed.

Hemlock, which was the cheapest species of lumber used in Canada in 1909 formed only 2.3 per cent. of the total mining consumption. Nova Scotia used all the hemlock, 1,172,000 feet, at an average cost of $13.38 per thousand. Very little hemlock grows in the mining districts of Canada.

The above five species, fir, spruce, jackpine, balsam and hemlock, of which jackpine was the most expensive, were the important woods used by the mining industries, forming over 96 per cent. of the total amount of the thirteen species reported.

Tamarack was used to the extent of 819,000 feet, and cost $14,102. This is an average cost of $17.22 per thousand linear feet—the highest price paid for any mining timber except cedar. Over 700,000 feet of this was used in British Columbia. 84,000 feet was used in Alberta and the remainder was about equally divided between Saskatchewan and Ontario.

Five-sevenths of all the pine cut was consumed in British Columbia coal mines. Ontario ore mines used nearly all the balance. The pine used in British Columbia is yellow pine and western white pine. The total pine cut was 720,000 feet and cost $14.21 per thousand linear feet. Small quantities of red and white pine are used in Ontario.

Birch formed less than one per cent. of the total. 326,000 feet were used in all, costing $4,311. This is an average of $13.22 per thousand linear feet. All the birch mining timbers were used in Nova Scotia.

Larch was used to the extent of 74,000 linear feet, and all in Alberta. The average cost was $12.52 per thousand.

All the poplar used, 54,000 feet, at $15.70 per thousand, was used in the same province.

One thousand feet each of maple and birch were used in Nova Scotia at $11 per thousand.

Three hundred and forty-eight thousand feet of timber was used, the kind of which was not specified. It came principally from the provinces of Ontario and Nova Scotia, and averaged in price $27.62 per thousand.

Cost of Round Mining Timbers

In Table 3 is given the quantity, total cost and average cost of the round mining timbers used in Canada, 1910, by diameter classes and species.

Table III.

The total quantity, total cost and average cost of the mining timbers used in Canada, 1910, by diameter, classes and species.

Species	Quantity	Av. Cost	Quantity	Av. Cost	Quantity	Av. Cost
Total (1)	19,046	$2.66	31,967	$12.63	1,835	$37.82
Fir	17,411	2.33	10,110	12.92	747	36.92
Spruce. . . .	445	8.35	13,116	11.32	856	31.80
Jackpine. .	1,156	5.30	3,216	17.25	83	61.60
Balsam. . .	.....	...	2,170	9.77	....	....
Hemlock . .	.....	...	1,155	12.23	17	92.30
Tamarac . .	.....	...	727	11.92	92	59.05
Pine. . . .	.....	...	688	12.15	32	58.53
Birch . . .	1	11.00	325	13.23	....	....
Larch . . .	.....	...	74	12.52	....	....
Poplar . . .	.....	...	54	15.70	....	....
Cedar . . .	.....	...	15	33.47	8	77.50
Maple . . .	1	11.00	.....	....	....	....
Beech . . .	1	11.00	.....	....	....	....

(1) Includes small amount of lumber not identified by species.

Of the 52,848,000 linear feet of round timber used in Canada during 1910, 31,967,000 feet were from 5 to 9 inches in diameter. This size of timber cost an average of $12.63 per thousand, and was used for various purposes: 5 to 6 inch timber was used for caps 2 to 10 feet long, and ties; 6 to 8 inch timber for long caps and 12 to 16 foot looms; 5 to 9 inch stuff for props in localities of great strain. In some mines where the seam is narrow 4 inch stuff is used for props.

The class under 5 inches in diameter includes 19,046,000 feet, or over one-third of the total consumption. This cost on an average only $2.66 per thousand linear feet. It is used mainly for pinning and logging. For pinning it is used in short lengths; for logging it is used in lengths varying from 8 to 12 feet.

There were used 1,835,000 linear feet over 10 inches in diameter. This timber cost on an average of $37.82 per thousand and includes the best quality of timber used in the mining industry. These large sized timbers are used for heavy props and in gangways. For such purposes timbers are used up to three feet in diameter.

In comparing the prices of different species in the same class, consideration should be given to the fact that the diameter size varies a great deal.

Of the fir used in the mining industry, 17,411,000 linear feet was less than 5 inches in diameter and cost $2.33 per thousand. The timber used under 5 inches diameter was practically all fir and was used by the large coal companies of British Columbia. 10,110,000 linear feet were used varying from 5 to 9 inches in diameter and cost $12.92 per thousand feet. Fir also stands second in importance in the largest diameter class. 747,000 feet were used, which cost an average of $36.92 per thousand linear feet.

Spruce was used to the extent of 445,000 feet in the class under five inches in diameter. This species was used more in the five to nine inch class than any other species, the amount being 13,116,000 feet. The 856,000 feet over 10 inches in diameter was all used in Alberta. Class 1 cost $8.35 per thousand while fir of this size cost only $2.33 in British Columbia. This apparent inconsistency is probably due to the fact that the spruce was used in Alberta. The large size spruce was all used in Alberta and cost $31.80 per thousand,—less than the cost of big timbers in any other province.

Jack pine was important, namely, in Class 2. 3,216,000 lin. feet was used of this dimension in Alberta, costing $17.25 per thousand. To a small extent this species was also used in Class 3 and cost $61.60 per thousand. 1,156,000 feet of jack pine under 5 inches in diameter was used in Alberta, and cost $5.30 per thousand, making it the next to cheapest in this class.

The use of balsam was all confined to Class 2, and consisted of 2,170,000 linear feet at an average of $9.77 per thousand. Thus balsam appears as the cheapest species in this class because it was all 5-inch timber used by a Nova Scotia company, and is a weaker wood than spruce and hemlock.

Hemlock was used only in two classes. 1,155,000 feet were used in Class 2 and cost $12.23 per thousand. 17,000 feet were used in British Columbia and averaged from 10 to 36 inches in diameter. These large size timbers make the average cost $92.30 per thousand linear feet,—the highest price paid for mine timbers.

727,000 feet of tamarac of Class 2 dimension was used throughout the various provinces and cost an average of $11.92 per thousand. Tamarac to the extent of 92,000 feet was over 10 inches in diameter and all used in British Columbia. It cost an average of $59.05 per thousand.

688,000 feet of pine was used from five to nine inches in diameter and cost $12.15 per thousand. 32,000 feet of timber was over 10 inches and cost $58.53 per thousand.

Larch was used in one class only, and that in Alberta. 74,000 feet of 6 inch diameter was used at $12.52 per thousand.

54,000 feet of 5 and 6 inch poplar at $15.70 per thousand was also used in the same province.

British Columbia used all the cedar. 15,000 feet of medium sized stuff was used at $34.47 per thousand, and 8,000 feet of large size timbers. These were used in the gold mines throughout this province and ranged up to 36 inches in diameter. The average cost was $77.50 per thousand.

1,000 feet each of maple and beech were used in Nova Scotia. This was small size timber.

Less than one per cent. in the total amount of round mining timbers reported could not be determined as to species. 317,000 feet were 5 to 9 inches in diameter, and cost $29.90 per thousand. A very small amount, 31,000 feet of ties, were not specified, and cost $9.70 per thousand linear feet.

Quantity of Sawn Timber Used in Mines

Table 4 shows the amount of sawn timber used in mines of Canada during 1910.

Table IV.

Quantity and value of sawn timber, by provinces, used by the mining industry of Canada in 1910, giving per cent. distribution and average cost per thousand board feet of each species.

Province	Quantity M. Board Ft.	% distribution	Value	Average Cost M. Board Ft.
Total	22,305	100	$303,998	$13.63
British Columbia	11,933	53.6	146,510	12.28
Alberta	5,569	25.1	77,114	13.85
Nova Scotia	3,282	14.8	45,281	13.80
Ontario..	1,390	6.4	29,470	21.20
Yukon	105 (1)		5,025	47.85
Saskatchewan	26 (1)		598	23.00

(1) Less than one-tenth of one per cent.

22,305,000 board feet of sawn timber was used and represented an expenditure of $303,998. This is an average of $13.63 per thousand. British Columbia used over 50 per cent. of this amount, of which the principal species was fir. The price of sawn lumber in British Columbia was only $12.28 per thousand,—less than in any other province. It is difficult to give the species of sawn timber used by the various provinces as a great proportion was sent in unspecified, but in most cases the species would be the same for the province as with round timber. Alberta used 25 per cent. of the total sawn timber consumption, and used seven different species of wood. 15 per cent. of the total consumption was used in Nova Scotia. Spruce was the principal species used in this province.

Ontario used about equal amounts of pine and spruce to make up the 1,390,000 board feet of sawn timber used in this province. Yukon and Saskatchewan used very small amounts. Yukon paid the highest average price of sawn timber, $47.85, most of which was spruce.

Importance of Different Timbers

Table 5 shows by importance of species, the amount and value of sawn timber used in Canadian mines during 1910.

Table V.

Quantity and value of sawn timber by importance of species used in Canada, 1910, giving per cent. distribution and average cost per thousand board feet.

Species	Quantity M. Board Ft.	% distribution	Value	Average Cost M. Board Ft.
Total (1)	22,305	100	$303,998	$13.63
Fir	10,107	56.7	104,151	10.25
Spruce	3,689	20.8	57,622	18.33
Larch	1,022	5.7	14,309	14.00
Pine	743	4.2	14,385	19.39
Cedar	614	3.5	6,070	9.90
Jackpine	539	3.0	8,121	15.09
Tamarac	518	2.9	7,277	14.07
Hemlock	361	2.0	5,055	14.00
Birch	149	.9	1,821	12.30
Oak	48	.2	4,285	89.25
Balsam	12	.1	420	35.00
Maple	4	(2)	102	24.28
Beech	3	(2)	71	20.28
Poplar	3	(2)	95	27.14
Cypress	4	(2)	48	110.09

(1) Includes a small amount of lumber not identified by species.

(2) Less than one-tenth of one per cent.

Fir was the most important species used for sawn timber, forming 56 per cent. of the total. 10,107,000 feet were used at an average cost of $10.25 per thousand,—the smallest average price paid for sawn mining timbers, except cedar. Spruce was used to the extent of 3,689,000 board feet and formed over one-fifth of the total consumption. Spruce was much more expensive than fir, costing $18.33 per thousand. The above two species, fir and spruce, alone formed three-quarters of the total amount of the sawn timbers used. Larch, pine, cedar, jackpine, tamarac, hemlock and birch were used in varying small quantities and ranged in price from $9.90 per thousand feet for cedar to $19.39 for pine. 48,000 feet of oak was used, mostly by the mineral mines of northern Ontario. The average cost of this timber was $89.25 per thousand feet. Also 436 feet of cypress at $110.00 per thousand was used by one mine of this province.

Preservation of Mine Timbers

The preservation of mine timbers by chemical treatment has not yet been adopted by the mining industries of Canada. In many localities however, the distances required to transport mining timbers are becoming greater, poorer qualities of woods have to be used and the annual cost of upkeep of mine timbering is becoming greater. The United States has already reached this state and has done much in the treatment of mine timbers; where it has been proven that a treatment of creosote or zinc chloride decreases the destruction due to decay, fire and insects, this increases the life of the timbers and decreases the annual cost of replacing mine timbers. Timber used in mines has on an average, a shorter life than wood used for any other purpose. The surroundings in a mine are very conducive to rot, which after a period of three to five years caused the timber to break, crumble and become useless. Experiments have been conducted in United States mines with a row of untreated and treated mine props alternately placed, After eighteen months every untreated stick was weakened by decay and broken, while the treated props were sound and useful. From various practical experiments of this kind with different species of wood, important results have been obtained.

Fir has an average of 5 years untreated life. Treated it lasts 12 years. Hemlock lasting as a natural wood 5 years, just doubles its term of life when treated as does chestnut and tamarac. Spruce is one of the species which decays quickest when untreated, lasting only three years. If treated it will last 12 years, thereby increasing its life 300 per cent. To sum up, wood preservation not only prolongs the life of durable timbers, thus decreasing their annual consumption but also permits the substitution of inferior species, whose use considerably reduces the drain upon the more desirable kinds.

The Prevention of Dry Rot

Every contractor who has to use wood for constructing purposes is well acquainted with the ravaging influence caused by the dry rot fungus. Naturally the knowledge of scientists has been enlisted for many years to find ways and means to stamp out this greatest of all foes to the building trades.

There have been on the market several effective means to cope with the destructive tendencies of the dry-rot fungus, but these means did not prove applicable in all cases. Only in the last year have the scientists succeeded in discovering a thoroughly effective preventive of dry-rot, which will shortly be universally employed, as its effectiveness has been proven in all cases where its use has been applied.

The new chemical has been named Kulba and is manufactured by Hartman & Schwedtner in Gross Schoenau, Saxony. Patents have been taken out in Germany as well as in all other civilized countries. It appears on the market in the two different make-ups, "White" and "Red." The new chemical will be in great favor in the construction of breweries, ice cellars, distilleries and mine structures. The use of the two different brands, "White" and "Red," will be governed by the more or less advanced stage of dry rot in the timber.

In spite of its high effectiveness "Kulba" is extremely cheap and economical, all that is necessary for permanent preservation being the double coating of the material by means of a common paint brush.

Some of the sterling qualities of "Kulba" are absence of odor or coloration. It is relatively non-poisonous, it does not evaporate or dissolve after application. One of its chief qualities of merit is that building material coated with "Kulba" can immediately afterwards be painted and will keep its paint permanently. Timbers impregnated with "Kulba" have been immersed in water for forty-five days and have afterward shown 8 to 14 per cent. greater firmness than timber not treated with the new chemical. "Kulba" does not enter into any combination with the wood fibers, nor does it form an air-tight outer coating, which demonstrates its great advantages over the tar containing preparations, which used to cause the humidity in the timber to produce a rotting from the inside.

Another great point for "Kulba" is its impregnation of the wood against inflammability.

At the office of the "Kulba" Company a large number of testimonials arrive daily from builders, wharf construction concerns and mine owners, acknowledging the universal effectivenes of the new chemical, which are continuous proof that "Kulba" is not only a thorough preventive of dry-rot fungus, but also a great conserver of wood in all its various employments.

Mr. R. A. Lucht, of 24 6th avenue west, Vancouver, B.C., the Canadian agent for Kulba, will be pleased to give further information and show samples of wood treated with Kulba to all interested parties.

The Strength of Spruce

In a recent issue of Aeronautics, of New York, is an article on the strength of wooden struts used in manufacturing flying machines. The tests were made in the University of London for the purpose of determining the comparative strengths of slender wood struts, and to find if possible the most suitable kind of wood to use in struts of aeroplanes, having due regard to strength and lightness. The report of the test made is very technical, but the result is indicated by the following: "The test indicates that American poplar, basswood, spruce and mahogany are the most suitable wood for these struts. Hickory is very tough wood and may be bent to a considerable extent without fracturing, but it will be noted that it is the heaviest of all the woods tested." Classifying spruce amongst the tough and strong woods should give it a better standing for masts and spars. Spruce has been used quite extensively for masts and many of the famous pleasure yachts of the world have been equipped with it. It is used not only as solid masts, but built-up ones.

S. P. Musson, Son & Co., Barbados, report as follows under date of August 5th:—Lumberstuffs.—White Pine—There have been no arrivals of lumber during the fortnight. There is a fair demand for white pine, and we think a cargo or two would sell well. Spruce on the other hand is not much enquired for. The Trn. Schr. "Ainslie" mentioned in our last brought 153 m. ft. of which 127 m. ft. chiefly interior, was sold at a round price of $17.69, and the remainder fetched $25 for merchantable and $21 for second quality. Pitch pine—A large cargo is expected which will supply requirements. Shingles—The "Ainslie" brought 70,600 Long Gaspe and 35,000 No. 1 cedar laying for which consignees obtained $4.80, and $1.80 respectively. Demand is good for both descriptions. Shooks—Receipts consist of 500 bdls. by the S. S. "Korona" from New York, 499 bdls. ex "Ocamo" from Halifax, both lots imported on dealers account. Wood Hoops—No arrivals.

Log Driving Upon the St. John River

Description of Method Employed to Drive, Sort, Measure and Deliver the Logs to their Various Owners

General View of Rafting Grounds

Bottom Makers Drilling the Logs

The St. John River Log Driving Association, the headquarters of which are located at Fredericton, N.B., is one of the most unique and interesting oragnizations for the carrying out of its particular branch of the lumbering industry which exists in Canada to-day.

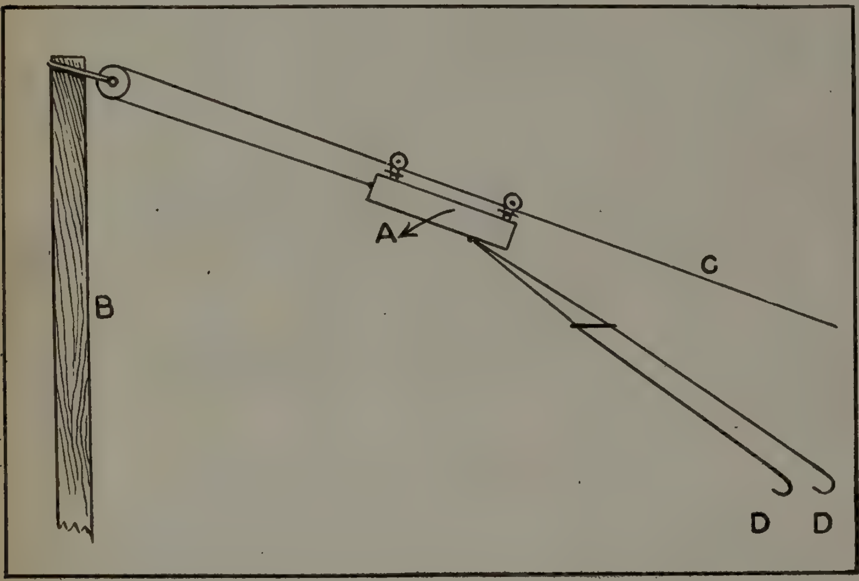


Diagram of Loading Machine

The following brief description will give a fair idea of the method of work pursued by the company.

After the logs have been placed in the river by the various operating companies located above the boom, they float down the river until they are checked by the company's boom. One of the illustrations accompanying this article gives an idea of the appearance of the boom. In the distance the boom is to be seen, and from it the logs are allowed to pass in small quantities so as to be sorted into pockets for the different companies, by which they are owned.

Another illustration gives an idea of the work of the scalers who measure the logs. A knotted rope is used by the scalers to ascertain the measurements, which are called out to a tally boy, who keeps track of them. In this illustration may also be noticed the overhead arrangement by means of which the logs are lifted onto the scaling raft. This loading machine is worked from the shore by a horse. It consists of a small car, "A" in the diagram shown, which travels along on the wire "C." The wire passes around a pulley on the post "B." To the end of "C" is attached a whippletree and a horse. "D" "D" are the hooks which fasten into the logs, as may be seen in one of the photographs reproduced. When the hooks have been attached the horse pulls upon the wire "C" and the log is lifted out of the water onto the scaling raft.

Another of the illustrations shows the bottom makers at work. These men are engaged in drilling holes into the logs through which are fastened wooden pins.

The loading machine in operation is shown in another illustration.

The St. John River Log Driving Association have a government charter for the St. John River, the Miramichi, and the Restigouche rivers.

Advices from St. John show that one of the first effects of the tariff agitation at Washington is now being felt in that city, says The Lumberman's Review. The so-called Pike law was passed by Congress many years ago. It provided that when logs were cut from land on the American side of the St. John River, and driven down to the mills at Fredericton and St. John, they could be sawed there and shipped into the "States" duty free. This was before the Maine railroads had been built through to the St. John River at Van Buren and Fort Kent. These railroads were followed by the erection of big mills west of Van Buren on the American side, and these interests very naturally objected to the Pike law, and Congress has repealed it.

Scalers Measuring the Logs

Loading Machine in Operation

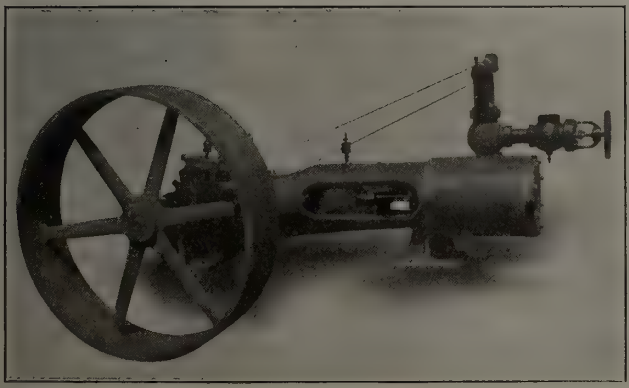
Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Efficient Portable Mills at Moderate Cost

The Leonard Portable Sawmill has during the last 20 years steadily come to the front rank for general effectiveness and moderate first cost as compared with the large stationary sawmills. A good portable can now be put up for less than 10 per cent. of the cost of some of the big saw mills, and whilst the big mill will cut 40 to 50 thousand feet per day, the large modern portable mill easily cuts 30,000 per day of 10 hours, giving better returns for capital invested and coming within the means of men with ordinary capital. The fire risk is also less, as very light material can be used for housing these mills, and no serious damage results in case of fire, to these low built ground-plan mills.

A brief description of portable mill methods may be appreciated by the uninitiated. First—a nice selection for a mill site is made, generally close to a brook, and the mill, say 25 ft. x 90 ft., put up parallel with it. The logs during the previous winter are "browed" on rising land alongside of the mill site. After the mill is set up, which may be done without any covering, or building, and afterwards covered in with lumber sawn on the spot, the logs are rolled down inclined ways and are quickly "dogged" on the carriage by means of the new Green Mountain Dogs—"dogging the log at one throw of the lever—for time counts in a portable mill. In Leonard Mills every contrivance is put on to facilitate cutting the lumber rapidly and accurately to make it merchantable. When is taken off, which drops on rollers ready to receive it. The trimmer-man cuts it up on the slab-saw into four-foot lengths (the boiler furnace requiring about every seventh slab to keep pressure up to the proper point, 120 lbs.) The remaining slab-wood is cut into laths on one of the Improved Portable Lath Machines. The rotary is now busy with the log. After the slab is removed it is "canted" and turned down on the straight cut side, and the carriage being carried to and fro by powerful friction feeds, the log is quickly converted into 3-in. deals, 2-in. planks and 1-in. boards. In these mills for rapid deal cutting, one pull of the lever makes a 3-in. deal and when the slabbed side of the log is "canted" up against the upright on the set-beam no calculation is needed to bring out the last board an even inch, thus avoiding waste. The rotary carriage is then free and ready for another log. It flies back and the set-beam and uprights open up at the same instant, by the sawyer simply pressing his foot on a lever. The carriage is then ready for another log—and so on.



The sawn lumber is edged by passing through a "Double" or "gang" edger, having saws moveable sideways at command of the edgerman, and this workman will adjust the saws to cut the lumber economically and leave no "wane" on the edges. The Leonard light portable edgers do this to a nicety, making straight and parallel cut lumber. The edged deal or plank is then passed on to an adjoining set of rollers where the ends are trimmed.

The sawdust, hitherto so difficult and expensive to remove with men and horses, is in the Leonard mill blown clear away from the mill by powerful blowers.

One of these 25 h.p. mills will cut 10 M per day—50 h.p. 22 M—and 75 h.p. about 30 M, and the laths in addition.

The engine and boiler that furnish the motive power are of the utmost importance—the engine must be economical on steam, not through any lack of fuel, but because the boilers are necessarily of moderate weight and size for easy transportation, and therefore, the boilers require large furnaces and great steaming capacity. The steam plant must be light, strong, simple and durable. The Leonard mill in a marked degree combines these very essential points for successful portable milling, and the portable boilers are now made for attachment to a "Dutch oven" enabling sawdust to be quite successfully burned, in this respect, practically putting them on a par with the big stationary mills.

The Robb Engineering Company, Amherst, Nova Scotia, and South Framingham, Mass., are building a return tubular boiler 48 in. by 12 ft. for C. O. Nichols, Somerset, N. S., and o boiler of the same type, 42 in. by 12 ft., for the Veniot Wagon Company, Limited, Bridgewater, N. S. With this last order is included an 8 by 8 engine and stack.

The Muskegon Boiler Works

The Muskegon Boiler Works, Muskegon, Michigan, have been very active in different provinces of Canada during the past year. They specialize in high pressure boiler work for sawmill use and also in sawmill refuse burners. This firm has an enviable reputation with the sawmill trade throughout the States and have equipped many of the largest mills with boilers and steel work as well as refuse burners. They have recently completed the installation of twelve 72 x 18 ft. boilers equipped with steel casings, stacks, breechings, sawdust conveyors, etc., together with a water space burner 34 ft. x 143 ft. high for the large new mill of the Big River Lumber Company, located at Big River, Saskatchewan, and have just completed the installation of seven similar boilers and equipment for the new mill of The Finger Lumber Company, The Pas, Kewatin. They have also recently completed the installation of a water space burner 36 ft. x 143 ft. for The Victoria Lumber and Manufacturing Company, Chemainus, B. C., and have recently secured contracts for a water space burner 30 ft. by 123 ft. for the Canadian Puget Sound Lumber Company, Limited, Victoria, B. C., and a water space burner 24 ft. x 107 ft. for the Baker Lumber Company, Waldo, B. C. This concern has enjoyed a steady growth and the confidence of the trade ever since its inception some thirty five years ago.

A Comprehensive Machinery Display

A visitor to St. John, N. B., will find many and varied places of interest to go to. To those who are especially connected with machinery, the new show rooms of the A. R. Williams Company, Limited, at 15 Dock street, will prove not only interesting but instructive.

Six floors covering a space of 20,000 square feet have been fitted up with all the inovations of modern machine craft, and present a very picturesque display. Here the visitor may see all that is new in machinery from the smallest drill to the larger mill machines. Safes, planers, band saws, and dozens of other lines are also on exhibit.

Under the able management of Mr. Manning Doherty this branch did, during the first six months of their existence, as much business as they had hoped for in the first year. Mr. Doherty is a graduate of both Toronto and Cornell Universities, having taken his M. A. at Cornell in '97, and his B.S. at Toronto in '95, was previously connected with the Sussex Manufacturing Company, until he formed the Canadian Machinery Corporation which in turn gave its selling agency to the A. R. Williams Company.

Mr. Doherty brings to the new branch many years of practical experience in handling machinery, and this has been one of the main factors in making the St. John branch a success. To any one interested in machinery, a most cordial welcome is extended by Mr. Doherty, to call and inspect their display.

The Maritime Foundry and Machine Company

An interesting example of what can be accomplished by systematic care is afforded by the remodeled plant of the Maritime Foundry and Machine Company, of Woodstock, N.B.

About eight months ago the business of the Alex. Dunbar & Sons Company was taken over by the present Maritime Foundry & Machine Company, under the management of Mr. F. H. McNaught. Mr. McNaught, who was formerly with the Dunbar Company as secretary-treasurer, besides being a practical business man, has had fifteen years' experience in foundry work. After a careful study of foundry conditions, both in Canada and the United States, he decided to increase the efficiency of his plant by systematizing its details. A cost system was inaugurated, the entire plant was divided into four departments with a special highly-paid foreman in charge of each. Attention was also given to improving the selling organization and the company is now rapidly establishing a connection from coast to coast.

Where "Dunbar" Logging Engines Are Made

The machine shop, covering a floor space of 45 ft. x 125 ft., besides being as large as any in the Maritime Provinces, is one of the most up-to-date in Canada. An experienced foreman has been put in charge whose main duty is to see that all work is turned out when promised. New machinery has been installed. In place of many cheap helpers, experienced machine specialists are now employed. This adds greatly to the quality of the work, and in the long run, is a source of considerable saving. The lighting of the shop is excellent, while the ventilation and sanitary conditions are the best that could be desired.

Logging Train Drawn by "Dunbar" Engine

The pattern shop, covering two storeys, 60 ft. x 30 ft., has been fitted up with modern wood-working machinery and put in charge of experienced pattern makers. All the machinery is electrically driven. Throughout the plant a blower system for sawdust, shavings, etc., has also been added. The blacksmith shop is splendidly equipped, while the moulding shop, the largest in the Maritime Provinces, covering a floor space of 40 ft. x 100 ft., has also received careful attention in the details of its arrangement.

To-day, this foundry turns out Dunbar shingle machines, clapboard machines, clapboard planers, lath machines, rotaries, stop gangs, and the celebrated Dunbar log haulers (note illustration). Already the results of this systematizing have been far beyond expectations. The quality of the work has been improved, deliveries are prompt, and the efficiency of this modern plant has been raised to a high standard. For his part in the success of the new company Mr. McNaught is deserving of great credit. Anyone visiting the plant will realize that it is an excellent example of the advantages of systematic and up-to-date management.

Information Upon Grinding Wheels

The Norton Company, Worcester, Mass., well known manufacturers of grinding wheels, for sawmills, have issued a useful and practical booklet regarding their product. The object of the booklet is to furnish suggestions on the selection and use of grinding wheels for sawmills. The booklet is illustrated, and contains a concise price list of a number of the products of the company. Within the compass of four pages the booklet gives information which is essential to all who have to do with the use of grinding wheels. A copy of the booklet should be in the filing room of every sawmill.

The Goodyear Tire & Rubber Company of Canada, Limited, have received an order for 12,000 feet of elevator belting, which is the rubber belt equipment of twenty-seven elevators for the Province of Saskatchewan.

The Merits of Douglas Fir for Interior Finish

The forests of the Pacific coast of British Columbia contain many different species of the wood family, but none which is more adaptable for all round construction purposes than the Douglas fir. Its adaptability to such a great variety of purposes to which lumber is put places it as the foremost of all round timber grown on the North American continent. Its use as a material for interior finishing purposes is one with which we will treat in this article.

The shortage of supply and prohibitory prices of the stocks heretofore depended on, have, in many cases, proved the entering wedge and convincing argument to the judgment of the unconvinced.

As an interior finishing lumber the Douglas fir will, when given a trial, merit immediate recognition. The slash, or flat grain, presents a great variety of characters, from the broad, bold waves of the commoner flat sawn stock to the beautiful curly and mottled effects of the finer and softer grains.

It is necessary, of course, that care and judgment be exercised in the selection and proper treatment given by the finisher, and when properly treated there is no hardwood known which will show more magnificent results. It has been demonstrated that the most remarkable and satisfactory results can be obtained by the use of stains, producing such effects as various shades of oak, green and mahogany. In fact the delicate effects used exclusively in fabrics bring remarkable results when applied to fir.

Fir finishing lumber has won its place in the great prairie country of Canada, and needs only an introduction to the eastern provinces to warrant the prediction that only a few years hence fir lumber will be used largely in place of the hardwood species, which, owing to shortage of supply, have advanced greatly in price, and the consumer is forced to look for something to take the place of what has been formerly used.

Anyone who has used the fir finish will venture the prediction that the consumer will be highly pleased with fir finishing lumber. The fir being of a soft wood species, has the distinct advantage over the hardwood species, of being easily worked with ordinary carpenters' tools, and yet is capable of taking the piano finish of the hardwoods on account of the firmness of grain and fibre.

Neglecting Canadian Lumber

"While many Canadians are crying out about reciprocity and the danger of annexation, some are losing opportunities of trading with our own people and are deliberately sending business across the border," said a prominent Montreal lumber merchant to a representative of the Canada Lumberman. "Instead of specifying spruce, Norway, or pine for timber of joisting, some architects order yellow pine from the States, although our native grown woods are equally as good for the purpose as those from the States. We are exporting spruce and Norway to the New York and Eastern State markets and yet while their quailies are thus being recognized, there are some Canadians who are neglecting it for Georgia pine."

Measuring United States Timber

To find how many board feet of timber are contained in the forests under Government supervision, to know what the increase from growth will be any number of years hence—this is the immense undertaking now being actively forwarded by the United States forest service. The work includes various other minor calculations, the sum total of which is expected to be of inestimable value.

In addition it will put at rest for all time the contention as to just how much of a demand the forest can supply.

The men assigned to the mensuration work now in the field are making interesting discoveries and gathering valuable data regarding the growth of various species under more or less favorable or unfavorable conditions. The result will reduce this branch of forestry to a more scientific basis. With this larger knowledge the rotation period for cutting not only will be shortened but the exact time required will be ascertained.

Conditions necessary to obtain the best productions are already pretty well understood. Under proper management and at no additional expenditure trees can be made to reach a given diameter in much less time than under ordinary natural conditions. The average lodge pole pine, for instance, reaches a diameter of twenty inches two feet above the ground at the age of 300 years. The forest service is now gathering data to show that under scientific management such trees will grow to the same size seventy-five years earlier, or thereabouts, the exact figure remaining to be determined.

Benefits following the taking advantage of such knowledge begin to accrue almost immediately. Profits from increased growth will be reaped by the present generation as well as by those of the future.

To ascertain the volume of timber within the immense areas of the national reserves would at first seem like a life-time undertaking for an army of men. However, each tree is not measured and counted. Efficient systems of estimation have been devised which give accurate results. Two systems are being used. One is the strip system. A section of forest—that is 640 acres—is plotted into forty acre squares. Through each square a strip one chain wide is measured off, and all the trees contained therein are measured with calipers and counted. The result is totalled and the remaining area in the section estimated, after the ground first has been gone over and allowances made for treeless spots.

The other method is the sample plot system. By this system a typical quarter acre stand is selected within each forty acre square, the trees measured and counted and the result used as a standard for estimating the remainder of the square.

The results obtained by these systems are peremptory, they are so nearly exact that they preclude challenge.

This work of learning the volume of timber is accompanied by the gathering of various other data. The different species and their proportion in a given area are tabulated. To learn the varying diameters is of much importance. A forest may be so stunted by dense growth that it will serve only for limited purposes. From such tables are computed showing how many railroad ties, mine props, etc., may be obtained, so that it is made known just what the trees are available for.

One of the most interesting of the investigations now being carried on is learing how fast the trees grow under different conditions and just how much thinning will produce the quickest growth among the different varieties. Certain areas are being thinned out and records being kept of the increased growth. Places long ago thinned out by the logger have afforded opportunity for the drawing of immediate conclusions covering a period of many years. Where they timbered for ties in Wyoming to build the Union Pacific Railroad valuable data has been obtained. Part of the table compiled by officials of the forest service is given below as an example of increased growth due to logging:

Diameter after 20 years		Diameter after 30 years	
If logged	Not logged	If logged	Not logged

9.15	9.05	9.85	9.65
10.15	10.15	10.80	10.75

The above table was made from a study of lodge pole pine, not a fast growing tree by any means, nor one that ever reaches a large diameter. A suppressed lodge pole pine—that is, one that has been crowded by older trees—100 years old a man can carry away on his shoulder with ease.

Some interesting mensuration work was recently carried on in the Arapahoe national forest near Fraser. One patch of forest was thinned out to what was considered ideal conditions for rapid growth. A stem analysis was made of a large number of the lodge poles cut down, including suppressed, intermediate and dorminant trees. The trees were cut into ten foot lengths and the annual rings of each length counted. This was done with the aid of pins and magnifying glasses. Where the trees are much suppressed it is impossible to see the rings, each of which represents a year's growth, with the naked eye.

In every tenth ring a pin was inserted on a radius line. And after all had been counted the growth by decades was measured off with a rule. These figures tell an interesting story of how practically all the trees started out well, but how many sooner or later were crowded and dwarfed by their older or better situated companions.

Five or ten years hence another stem analysis will be made of some of the trees left standing and in this way the advantage of thinning will be known absolutely by comparison of tables.

Stem analysis were made in several representative plots in the Araphoe forest, and have been and are being made in other forests in this state and district as well as in all the other districts in the forest service. The most productive and scientific methods of management to supply the great demand for wood in all its forms will be the result.

Solving the Low Grade Problem

Box manufacturers are gradually and to a certain extent unconsciously solving the low grade problem in lumber that has been bothering both themselves and saw mill men. It is no quick and sudden solution, but a gradual evolution in the way of developing machinery designed especially for the work of refining low grade lumber into box stock.

The great burden of the box men has been the increased cost of raw material, while at the same time the purchaser of boxes has been striving for economy, making it difficult to get the higher price for the finished article.

Turning for relief from the better grades of lumber to the low grade the box men at first thought they had the solution of it, but they found that it cost so much more to work up the low grade than the better grades that most of the saving in first cost was used up in shop expenses. This naturally beat down the price of low grade lumber until there was nothing in it for the mill men to encourage handling it and the problem of getting through with it successfully has been more or less of a burden to both the mill man and box factory for some time.

The problem is being gradually solved, however, with the aid of the machinery men, and the logical line of solution being followed is something like this:

"The more defects there are in lumber the more deliberation ordinarily must be used in manipulating it, more cross-cuting, more ripping and more matching must be done, and the problem for the men and the machines is to do the increased machine work at the smallest practical cost and, at the same time, do it so as to utilize all the good material in the low grade board, and eliminate in the scraps that which is simply not fit to use. To state the matter another way, the poorer grade of lumber and its increased value is making more imperative the use of machinery, improved specifically with a view to working up lumber so as to eliminate scrap and yet save all that is good of the board without increasing too much the cost of the work. The necessity for excercising judgment in cutting out defects and the irregular location of the defects makes impossible the use of automatic machinery, except after the process of manufacture has reached a certain stage. We may, however, get machinery that is less burdensome to operate than some of the old-time machines and arrange it in various ways for the convenience of the operator to economize in time and in physical strength, and to make it so easy for the man cutting up the stock that nothing but carelessness need keep him from excercising judgment in the work, to get the most out of his lumber and get it in the best shape.

Then from time to time an entirely new idea is developed, either by improving some well known pattern of machine or by bringing out an entirely new and distinct one and thus, step by step, progress is made toward solving this problem of getting good box stock out of low-grade lumber at a nominal cost."

One of the most trying features that still remains is the cost of shipping the waste material of low grade. Some efforts are being made to solve this on one side by striving to have the railroads make a lower rate on this class of material, and the other by refining it at the saw mill before shipping. Mixed in with this, too, is some disposition on the part of box factories to concentrate as near as possible to the source of supply for the raw material. Where the freight haul is not long it is more satisfactory to take the low grade lumber to the box factory and work it up as it is needed. A part of the work of solving this problem is being accomplished by this means and by the mills themselves installing a whole box equipment and shipping finished shooks and boxes instead of the raw material for them.

Aside from this matter of location and freight, however, good progress is being made in the way of solving the whole problem by improved machinery and methods of manufacture, and at the rate machinery poeple are progressing it looks like there is really not much room to worry about this problem and plenty of room to use even more of the low grade product of the saw mill.

Activity in British Shipbuilding

According to the statistics recently issued by Lloyd's Register, shipbuilding figures constitute a record, showing, as they do, an output surpassing the previous quarterly record total of September, 1901, by no less than 60,000 tons. Altogether there were at the end of the last quarter no less than 496 vessels in course of construction, amounting to 1,476,000 tons, which, when compared with the corresponding quarter of 1910, shows an increase of some 350,000 tons. If a comparison is made with the June figures of 1909, the difference is enormous, as this year's figures are practically double those of the year before last. The total does not include war vessels, of which there are as many as 64 under construction, 59 being for the British Navy and five for foreign account. Of the 59 naval vessels, 11 are under construction at the Royal Dockyards and 48 in private yards. The British mercantile shipbuilding record is well in advance of other countries, the nearest approach being that of German yards, where 82 ships, of something over 250,000 tons, are being built. France comes next with 126,000 tons. America with 98,000 tons, and Hallond with 78,000 tons.

Improvements which a Modern Planer Ought to Possess

As a practical mechanic who has toiled amid the din and roar of machinery in various wood-working establishments, I have noticed many improvements on the various machines. Let us take the planer for example; we have many types of this machine made by different makers, each and all of whom have some redeeming feature about them, which either increases the output or the quality, or tends to reduce the danger of accidents to the operator.

Now why should we not have all those manifest advantages combined in one machine? No doubt it would be a costly machine, but its enormous advantages would soon pay for the extra initial cost. We should soon forget the price, but never forget that we possess a first-class machine which does first-class work quickly and cheaply.

The following are a few really good improvements, which ought to form part of every up-to-date planer.—A circular cutter-block or cylinder running in long self-lubricating or ball-bearing journals belted at both ends, for all machines over 16 inches wide. Then we could safely run at 4,500 revolutions per minute with a perfectly-balanced cylinder which would naturally produce first-class work even on coarse or cross-grained timber. A sectional feed roller would largely increase the output, as it would be possible to use the machine up to its capacity with perfect safety when planing narrow widths of varying thicknesses, without fear of the thinner strips shooting back, as every piece would be firmly held by the sectional feed roller. It would also be advantageous to have a range of speeds on the feed from 12 to 30 feet per minute, to cope with the varying grades of timber and quality of work desired. An arrangement for raising and lowering the bed would also be a great time and labor-saving attachment—the finer adjustment could, of course, be manipulated by a hand-wheel, as at present.

A positive chain feed would also be an improvement, providing a good friction clutch is supplied so that the feeding can be instantly stopped if occasion arises.

It would also be desirable to have a set of fences for doing the edges. Those would require to be arranged in such a way that they could be quickly put in position, and be quite rigid, so that we could depend on the edges of the timber being perfectly square.

Now that the dust-collecting system has come to stay, provision should also be made for a hood, which should be finished off in such a way that it would only be necessary to lead the blower pipe to it. Last, but not least, a modern planer that has to stand the racket of 4,000 odd revolutions per minute must be provided, with good wide pulleys of fair size, so that a good wide belt may be used and reduce belt trouble to minimum. And there you have all the good things combined in one machine. It may be costly, but it certainly would be a good investment as a time saver and a money maker, besides being a pleasure to work it. J. M. N.

Some Phases of Handle Production

The selection of a suitable lathe for the handle plant is rather a difficult proposition, as there are a large number of makes on the market at the present time, writes H. B. Alexander, in The Hardwood Record. Rather than buy merely on the recommendation of the manufacturer, it is wise to go slowly and by means of communication addressed to users of the different types of machines, to ascertain the good points of each relative to capacity, accuracy and stability.

There are lathes on the market that are cheap in price, and for the first few months will turn out fair work, but as a rule they will not keep it up, being too light in the working parts. Then soon wear so that it is impossible to keep them in shape and manufacture uniform handles. There are others extremely high in price, and while there is no doubt but that they are good machines, yet owing to their complex construction the output is no greater than that of some of the more reasonably priced makes and repairs are more numerous and more expensive.

A good lathe should be as simple in design as possible and should have a minimum number of working parts. It should be so constructed that in the event of a handle being stuck, owing to poor stock, there would be no difficulty in getting to the source of trouble. There should be an adjustment whereby the finishing would move out of the way in case of an accident of this kind, enabling the handles to be driven out without nicking the knife.

The sliding, or expansion heads, without which there would be no throat in the handles, are the weak point in nearly every make of machine. These parts are made of various materials, some being of cast iron, some of Babbit and some of brass. All are subject to more or less wear. Wear in this part is very liable to cause variation in the shape of the handle and to make what is called "checker board," filling the throat with a multitude of fine holes which no amount of sanding will eradicate. Again it may cause a series of steps, which are equally objectionable. Nearly all difficulty of this character can be traced directly to trouble in the expansion head; either it is worn so as to allow play, or some of the screws or other parts are loose. The one exception is caused by making the handles too loose in the bushing before they come to the finishing knives. This is a point that has caused more trouble than any other, as so many turners show a desire to run their handles as loosely as possible, thus avoiding the time and trouble necessary to keep their front knives properly set. The handles should fit the barrel snugly enough to prevent jumping and shattering, and yet should not be tight enough to burn.

In connection with this branch of the industry, why wouldn't wood-fibre be a feasible substitute for the metal commonly used in expansion heads? It seems reasonable to suppose that this would do away with a large percentage of the trouble caused by wearing in these parts. It would have been tried before this, in many cases, were it not for the fact that stock thick enough is very difficult to obtain. For the present Babbit seems to have the preference over brass, as it is found to wear longer.

Some lathe manufacturers have been accustomed to reduce the distance between the roughing and finishing knives, an idea which has probably been carried too far, as in order to make neat, smooth, uniform handles, the long barrel is necessary. If there is only an inch or less between knives, then it will be necessary to run the handles so tight in the front head as to bring them almost to the burning point. Under such treatment the knife heads will not last for any length of time.

Knives on handle lathes should have just as careful treatment as on all other wood-working machinery, and care should be taken to give them a shearing cut, thus prolonging the efficiency of the knife and assuring cleaner and more satisfactory work. It is folly to attempt to run a knife after it has once become dull, as the work turned out is not only of inferior quality, but is also expensive to produce. By this means the grades of stock are much run down, as many handles are poorly manufactured or burned. Because of the large number of handle manufacturers doing a small business with inadequate machinery, the market is already flooded with low-grade handles, and it is not advisable to turn out any more of this kind of stock than is absolutely necessary.

Another point which is open to considerable improvement in handle lathes is the method of feeding in the blanks. There is, probably, only one proper way, namely, to provide a rack on the front end of the lathe sufficient to hold a dozen or more blanks and let the bottom blank rest on a set of feed wheels, which will open and close at the proper intervals to take in the blocks as they are needed. In order to keep the blanks square with the heads and in the centre of the machines, they should pass through two sets of feed wheels, one set vertically and the other horizontally. The principle involved in the common form of feeds is to drive the blanks into a set of feed-wheels far enough so that they will be caught and carried along. The trouble usually experienced with this style is often due to a variation in the sizes in the blanks. The smaller ones are driven in too far, thus making long heads, and the larger ones are not carried far enough, thus creating the opposite result. It is easily seen that in this way uniformity in finished handles is very difficult to obtain, and uniformity is one of the most essential qualities demanded by broom makers.

The pattern wheel or cam, as it is sometimes called, is located on some lathes at the front end, on some on the back side and some on the front side. The exact location is immaterial, and should be governed by the position of the machine and be placed where it can be gotten at easily for adjustment. Hardwood cams usually show the best results, for the reason that they show as good wearing qualities as the metal ones, and will allow of alterations in design, which is not possible if metal is used. Especially designed cams for the production of a certain type of handle can be produced very cheaply if hardwood is used, while if metal cams are required they must be usually worked for a long time before they are gotten to the desired shape. In addition, a wood cam can be produced in a few minutes with a band saw, or if this is not available they are easily made with a common keyhole saw.

Running the handle too snugly in the barrel causes a good deal of friction at that point, and the barrel is consequently heated rapidly. If this were allowed to continue for any length of time the lathe would be brought to a stop. Ao avoid this, dip the front ends of the blanks about a quarter of an inch in some cheap oil (an article suitable for this can be obtained for almost nothing, and should be kept in shallow pans handy to the lathe). The oil on the ends of the blank is thus drawn off to the sides of the barrel and keeps it cool. All that is on the sides is cut off at the first operation, and is usually wasted. Without proper care, and by dipping the blanks too deeply, the waste is considerable. About two barrels of oil, containing fifty gallons apiece, are required to run two lathes for a month, and in this time about 140,000 handles can be turned out, and as the initial cost of the oil is slight, the cost per handle is infinitesimal. Yet if it were not used the reduced amount of output would be a considerable item of loss.

Gang Saw Fittings as Applied to the Modern Manufacture of Lumber

One of the most essential features requisite to the successful fitting of gang saws should be the filer's ability to put the machine in first-class working order and see that it is kept in that condition; otherwise, if the saws begin to run badly, it is sometimes difficult to locate the trouble.

If the bearings on the slides, oscillating bars, links, etc., are not kept reasonably tight, you cannot expect the most finely fitted saws to do first-class work, for this reason: If the connecting links and oscillating bars (some manufacturers call them pendulums) are loose to any extent, they cannot hold the sash in the same position at every stroke of the machine, consequently the amount of cutting at each stroke of the sash will vary in proportion to the looseness of the bearings. Another feature to be observed, and more especially in a short-stroke machine, is not to carry too much hook in the saw teeth. The old adage that "The more hook and the slimmer the tooth, the easier the cut," has not worked successfully here.

Saws fitted with too much hook in the teeth have a tendency to pull the sash forward at the top of the machine, catch in the timber and "chunk" badly. The top slides are liable to heat on the front side, and unless the front roll runs very close to the saws, will have a tendency to lift the cants at the back end and produce violent pounding on the back rolls until the front end of the cant reaches the second binding roll. One of the best methods that the writer has tried, to determine the proper amount of hook, is by watching the top slides closely, and if they heat on the front side, reduce the hook in the teeth; if they heat on the back side, add more hook until the bearing runs normal. By using good judgment the operator can adjust the fitting to a nicety.

The tools necessary for the successful fitting of gang saws are as follows: Suitable clamp for holding saws while swaging, shaping, setting, etc.; eccentric swage, swage shaper, automatic grinder, set and gage for keeping the set equally divided on each side of the saw to insure making straight lumber; wire gage to show that you have a uniform set in the saw at all times, and a hook gage to determine that you do not change the hook in the teeth by the emery wheels wearing out of shape on the face side and not being at all times dressed properly; also some suitable wheel dresser, as the wheels get out of shape very easily, and it would be impossible to do first-class fitting with an ill-shaped emery wheel.

For the tensioning of gang saws you will need the following: Anvil, cast iron leveling block the length of the saw between tabs, cross-face hammer, doghead hammer (hammers of about 3-lbs. weight), saw-stretcher, straightedge, and tension gage, etc. Every file room should have a shear and retoother, but for the fitting of gang saws these can be dispensed with.

The actual operation of fitting the gang saw begins by securing the saw firmly in the clamp, adjusting the eccentric die of the swage to spread the tooth to the desired width to allow of free and easy cutting in the timber. Use chalk or oil on the under side of tooth to prevent the die from abrading the tooth. Be sure the swage is spreading the tooth instead of biting off the point. Adjust the swage so that it will throw the tooth far enough ahead to allow about equal grinding on the front and back.

When you have finished swaging the saw, shape the teeth to the required set, and equalize the amount on each side of saw with set and gage. You cannot be too particular in regard to this, for if the teeth are not set uniform, the saw will cut rough lumber and will make thich-and-thin lumber.

After swaging, shaping and setting, see that the carriage on the grinder is exactly plumb with the centre of the mandrel on both ends that carries the wheel, also that the form has the proper shape to produce the desired form of tooth. If the machine is in proper condition, you will not be required to grind across the saw more than three of four times, and yet you can grind to such perfect condition that it will not be necessary to do hand filing to any extent, unless you might be required to "touch up" a tooth with the hand file, where a corner might have been dropped and it would be necessary to swage more than once to get the required set.

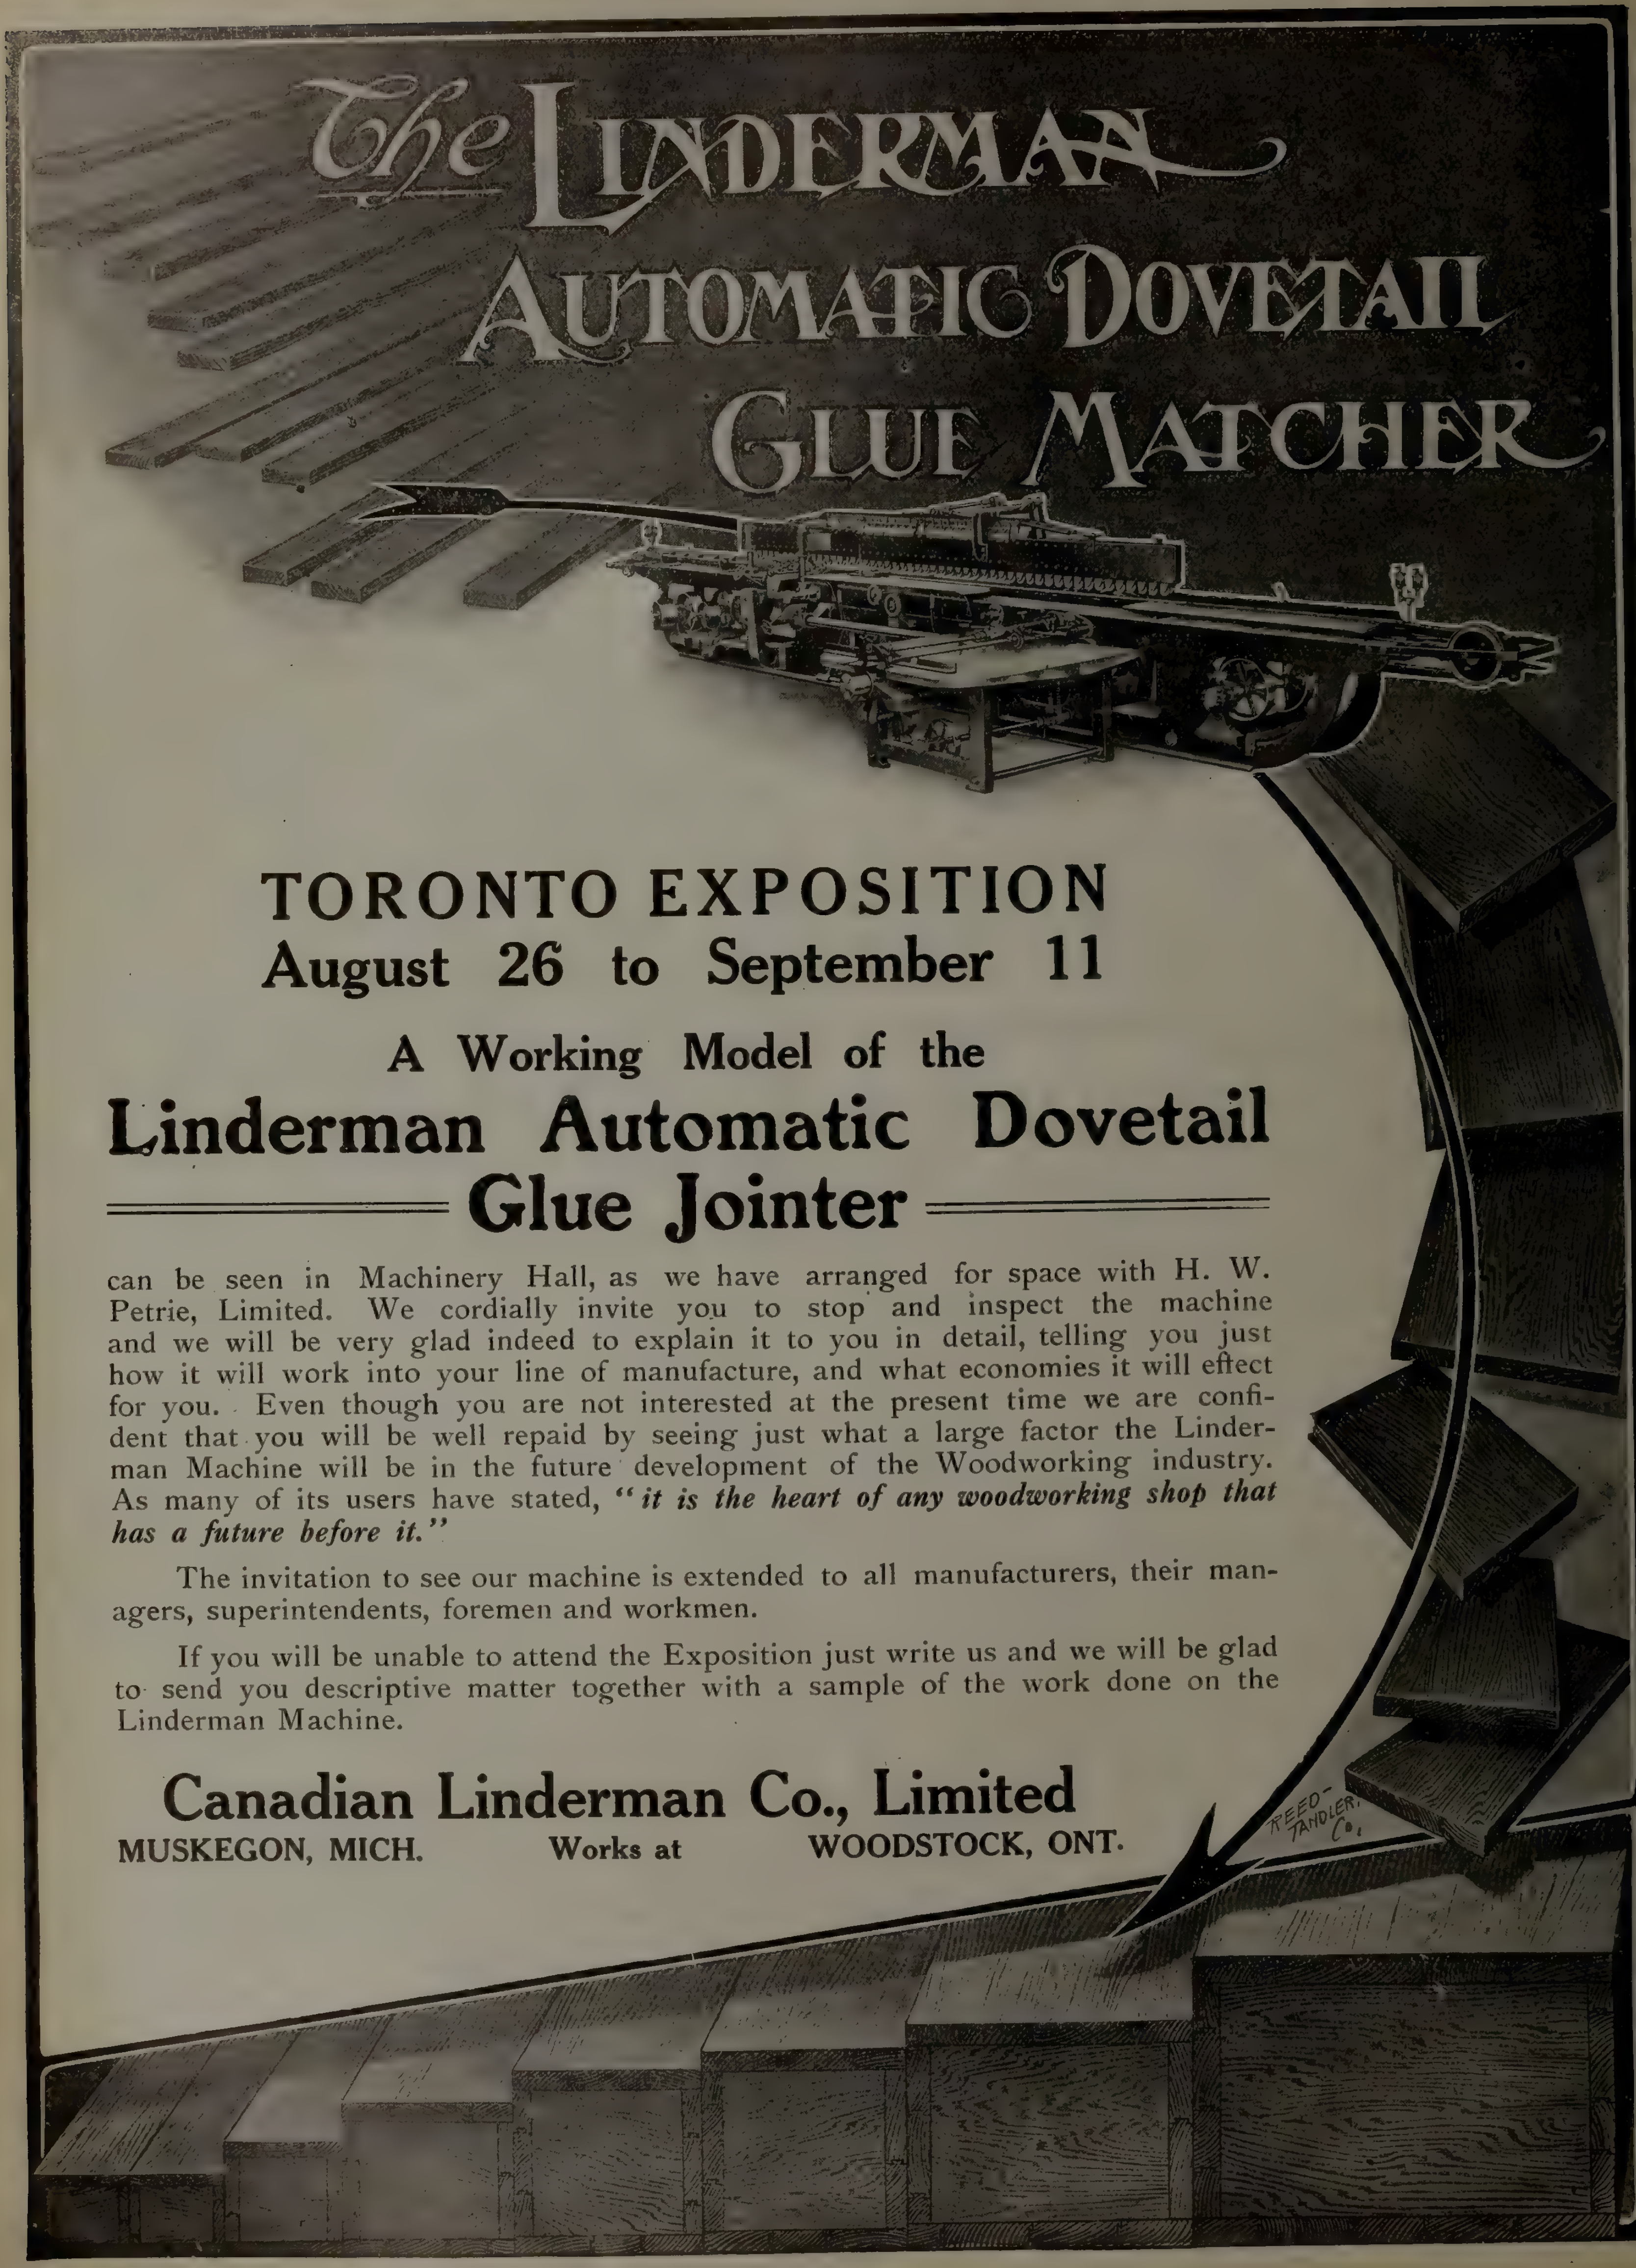
Examine your grinding closely to make sure the wheel is grinding perfectly square on the top and bottom of tooth, for if it should vary, if ever so little, in a short time the swage would begin to throw out more material on one side of the tooth, and unless this equalized, it might cause the machine to make thick-and-thin lumber. By watching your swage and grinding machine closely you should detect any irregularity that might occur, at once, and save endless trouble later—and much spoiled lumber.

As to the exact amount of set to carry in a gang saw, it depends largely on the different species of timber you are cutting and the amount of feed you are using. With a short-stroke machine, where only a few teeth are doing the cutting you will be required to carry more set than you would with a longer-stroke machine. Where saws are cutting soft timber and the saws are only changed twice daily, if there is not an abundance of set, after they have been cutting three or four hours, the set is liable to wear considerable on the corners and diminish it to such an extent that the saw will warm on the front edge, bind in the cut, and chunk considerably when the saws leave the cut. In Pennsylvania hemlock and white pine we have found that about six gages of set will be sufficient. In hardwoods about five gages has given satisfaction. If the timber is frozen, about one gage less than the above will work very nicely. For free and easy cutting be sure the corners are keen and sharp.

Gang saws should be tensioned the entire length of the blade. Do not leave "fast" places in that portion of the blade between the teeth and the tabs, unless you are looking for trouble. Begin by rolling in the central part of the blade, and roll gradually outward until you have carried the tension to within about ½-in. of the edges, being careful to keep the saw straight, giving, say, 3/64-in. drop under the straightedge in a 6-in. saw. It is preferable to use a tension gage for this purpose (any first-class saw manufacturer will be pleased to furnish one gratis for the asking), ground to the proper circle. Try the blade frequently with the tension gage while undergoing the process of tensioning, and if you find you have too much drop, hammer or roll lightly along each edge of the blade until it conforms to the tension gage. If you find fast places, continue rolling or hammering on that portion of the blade until you have a perfect tension. Now lay the saw on the leveling block and examine carefully for lumps and ridges, which reduce with the cross-pein hammer, being careful to strike light blows, placing them exactly on the lump or ridge, as the case may be.

By following the above instructions carefully, any intelligent mechanic should have no trouble in making a successful gang filer. However, I would add that practice makes perfect, and this you cannot expect without diligent application. This article is not intended for the experienced mechanic, nor for the purpose of argument or criticism, but for the benefit of the inexperienced filer who wishes to profit by the experience of others.—The Wood-worker.

One of the phrases that have crept into the literature of the lumber trade is the following. "Refined lumber." This is a new phrase for an old process. It means, making upper grades out of low grade stock by cutting out defects. No matter what name may be given this phrase of manufacturing, the suggestion should be carried to its fullest extent.



TORONTO EXPOSITION
August 26 to September 11

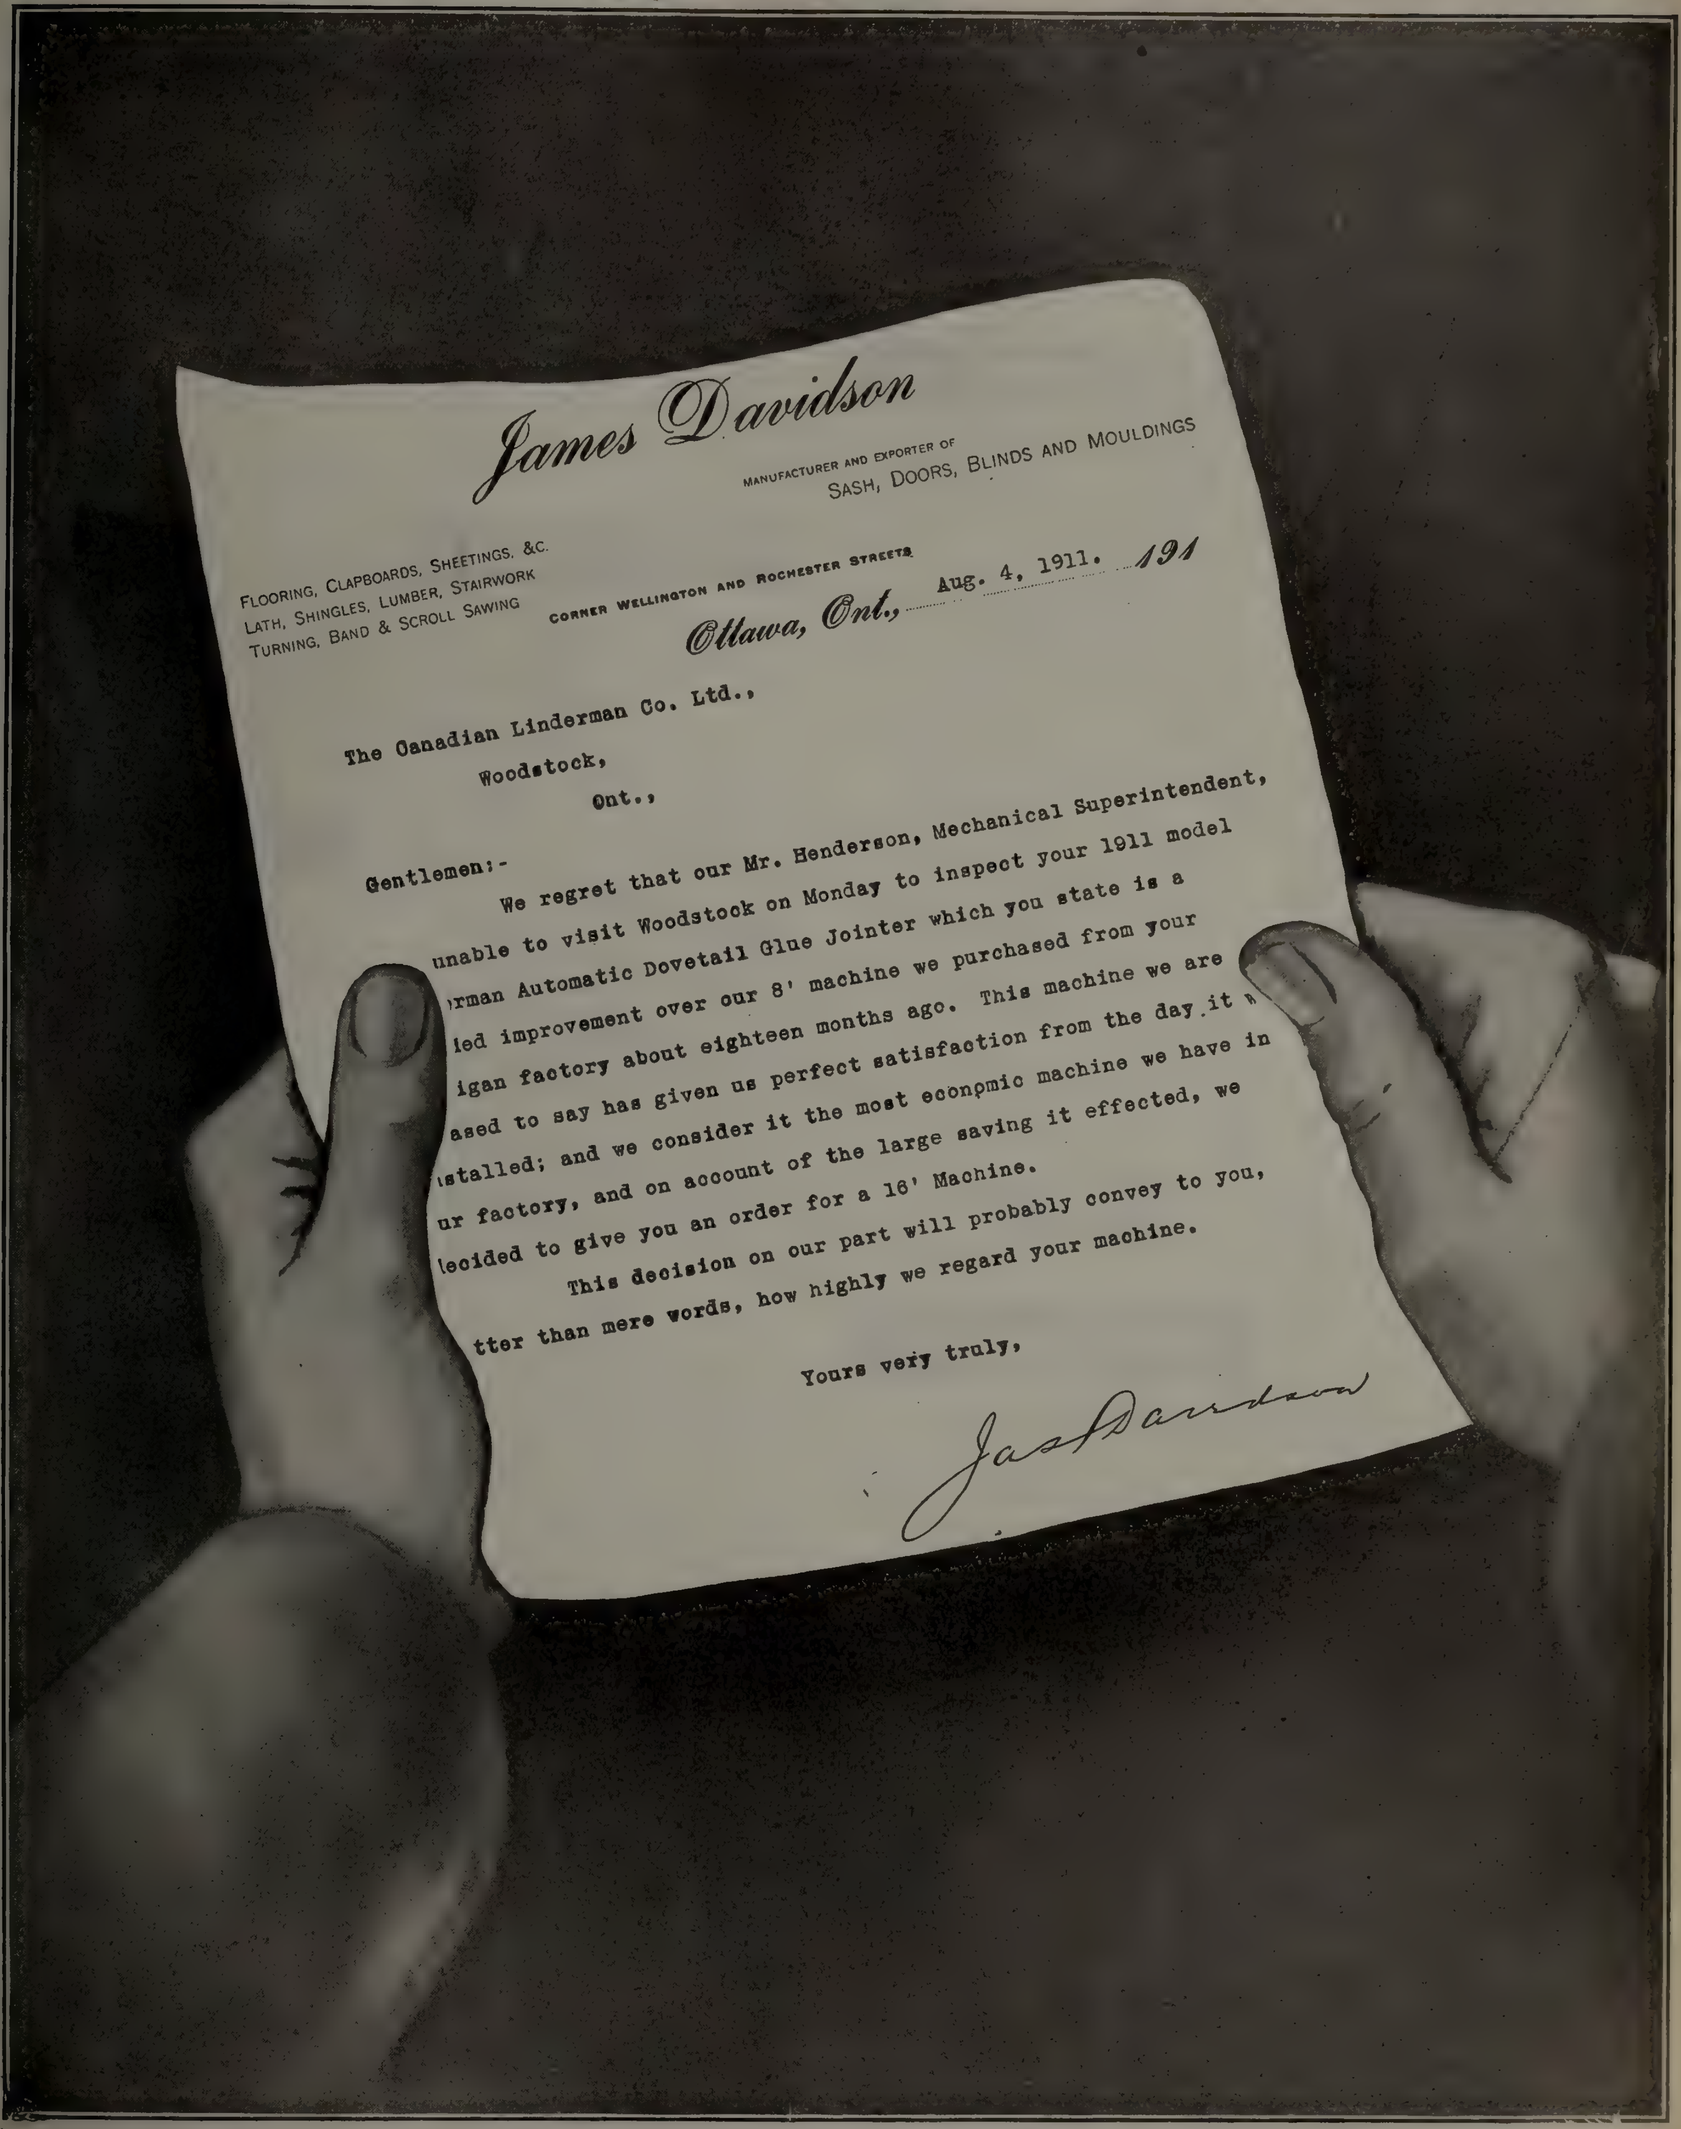
A Working Model of the
Linderman Automatic Dovetail Glue Jointer

can be seen in Machinery Hall, as we have arranged for space with H. W. Petrie, Limited. We cordially invite you to stop and inspect the machine and we will be very glad indeed to explain it to you in detail, telling you just how it will work into your line of manufacture, and what economies it will effect for you. Even though you are not interested at the present time we are confident that you will be well repaid by seeing just what a large factor the Linderman Machine will be in the future development of the Woodworking industry. As many of its users have stated, *"it is the heart of any woodworking shop that has a future before it."*

The invitation to see our machine is extended to all manufacturers, their managers, superintendents, foremen and workmen.

If you will be unable to attend the Exposition just write us and we will be glad to send you descriptive matter together with a sample of the work done on the Linderman Machine.

Canadian Linderman Co., Limited
MUSKEGON, MICH. Works at WOODSTOCK, ONT.



James Davidson

MANUFACTURER AND EXPORTER OF
SASH, DOORS, BLINDS AND MOULDINGS

FLOORING, CLAPBOARDS, SHEETINGS, &C.
LATH, SHINGLES, LUMBER, STAIRWORK
TURNING, BAND & SCROLL SAWING

CORNER WELLINGTON AND ROCHESTER STREETS
Ottawa, Ont., Aug. 4, 1911. 191

The Canadian Linderman Co. Ltd.,
Woodstock,
Ont.,

Gentlemen:-

We regret that our Mr. Henderson, Mechanical Superintendent,
unable to visit Woodstock on Monday to inspect your 1911 model
rman Automatic Dovetail Glue Jointer which you state is a
ied improvement over our 8' machine we purchased from your
igan factory about eighteen months ago. This machine we are
ased to say has given us perfect satisfaction from the day.it w
stalled; and we consider it the most economic machine we have in
ur factory, and on account of the large saving it effected, we
lecided to give you an order for a 16' Machine.

This decision on our part will probably convey to you,
tter than mere words, how highly we regard your machine.

Yours very truly,

Jas Davidson

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED–LUMBER, ETC.

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

White Pine Timber Wanted

Tract of two to five million in Ontario. Principals only. Apply Box 307, care Canada Lumberman, Toronto, Ont. 16-17

WANTED

Cash paid for green clear Maple axles 4¼ in. x 5½ in., 6, 12 or 18 ft. long. If you can get out a carload or more write us. Warren Ross Lumber Company, Jamestown, N.Y.

18

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Tank Lumber Wanted

We require 2-in. and 3-in. Tank White Pine, 6-in., 7-in., 8-in. and 10-in.; 10 ft. to 24 ft. Also red pine. Highest prices for Pump Squares. Ontario Wind Engine & Pump Co., Ltd., Toronto, Ont. 7-tf.

We want to buy from one to five million feet White and Red Pine, also one to three million feet of Hemlock; about one million feet Birch and Ash. For either boat or rail delivery. Immediate shipment. Let us know what you have for sale. The M. Brennen & Sons Mfg. Co., Ltd., Hamilton, Ont. 17-17

White Pine Pickets Wanted

We want at once 4-4 x 4-4 x 44 in. and 48 in., 5-4 x 5-4 x 44 in. and 48 in., and 6-4 x 6-4 x 48 in. White Pine Pickets. If you have anything in the above write, stating quantity, when cut and best prices. Will buy any quantity from a car to your entire stock. Box 58, Ogdensburg, N.Y. 20

FOR SALE–LUMBER, ETC.

Veneer for Sale

One car 12-inch and 12½-inch cheese box veneer. Address, Box 25 Eldorado, Ont.

17-17

Pulpwood Etc. For Sale

A party in Quebec Province wants to hear from firms, Canadian or American, that would buy pulp, lumber or ties. Apply Box 315, Canada Lumberman, Toronto, Ont. 16-17

For Sale

1 car 2-in. Rock Elm, mill run.
20,000 ft. 1-in. Soft Elm, 12-in. and wider, 1st and 2nd.
1 car 1-in. Basswood, common and better.
3 cars 3-in. Hard Maple, 1st and 2nd.
1 car 2-in. Hard Maple, 1st and 2nd.
1 car 1-in. Hard Maple, mill run.
Box 319 Canada Lumberman, Toronto, Ont. 17-t.f.

For Sale

100 cars Longford Hemlock, assorted sizes.
100 cars Whitney Spruce, any width.
25 cars Ravensworth Birch, 1 in. and thicker.

Apply to Quincy Adams Lumber Company, Limited, Longford Mills, Ontario. 14-17

FOR SALE–MACHINERY, ETC.

Operating Saw Mill For Sale

at Uhthoff Station, G. T. R. Capacity 25 M. feet, containing stationary boiler, 80 h.p.; one engine, 50 h.p., and machinery outfit and building. Will accept $1,000 in full to close estate, as timber is done. Apply to W. B. Tisdale, Orillia, Ont. 17-t.f.

Bargains in Planing Mill Machinery

Two No. 44 Berlin planer and matchers, 9 x 6.
One No. 125 Berlin comb moulder and matcher, 10 x 6.
One No. 254 Berlin self feed rip saw.
One Williamsport self feed rip saw.
One Colloday small outside sticker.
Fifty heavy two wheeled lumber buggies.

RED CLIFF LUMBER CO.,
Duluth, Minnesota.
17-18

Machinery For Sale

Band saw, 37-inch Clement.
Carver, 4-spindle Rohlman.
One cut-off saw, railway wood frame.
Dovetailer, Boults.
Engines and boilers, various sizes.
Floorer, 9-in. Berlin.
Jointer, chair seat Jenkins.
Jointer, 16-inch White.
Moulder, 6-inch Houston.
Mortiser, hollow chisel, Greenlee.
Mortiser, Smith.
Mortiser, Bit.
Planers, 24-in. single belted.
Sander, double 24-in. Perry.
Sander, three drum 42-in. Boardman.
Sander, three drum 42-in. Columbia.
Saw gummers, Rogers.
Saw mill, band, 63-in. wheel.
Saw and dado machine, Williamsport.
Variety lathe, Pringle & Brodie.

O. L. PACKARD MACHINERY CO.,
Milwaukee, Wis.

WANTED–EMPLOYEES

Advertisements under this Heading two cents a word per insertion. Minimum charge 50 cents

WANTED—A competent Pine Lumber Inspector, accustomed to grading for the Ontario market. Apply, stating salary expected and giving references, to the Sheppard Lumber Company, Limited, Waubaushene, Ont. 14-17

WANTED—Man to manage barrel heading mill. Must understand the manufacture of heading and be able to install machinery. Apply Box 321, Canada Lumberman, Toronto, Ont. 17-17

GENERAL SUPERINTENDENT—Large Western concern, English capital interested, wants first-class man as superintendent and technical adviser, Canadian preferred. Must be active man with thorough woods experience, knowledge of business side, thoroughly abreast, up-to-date ideas of forest management. Responsible position. Applications must be accompanied by full statement of experience, supported by copies of all testimonials (instead of references) and photograph. G. FINCH, Box A. V. 242, The Oregonian, Portland, Oregon. 15-16-17

WANTED–EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. ten cents extra. Minimum charge 25 cents

Band saw filer wants position, double or single cut, or in a factory where there are band resaws. Apply Box 322, Canada Lumberman, Toronto, Ont. 17-18

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

Position Wanted

By man capable of taking full charge of logging operations, 50 M. up, stump to mill; married, sober and hustler; a good estimator and buyer of timber, would take charge and look after larger holdings and buy up small lots adjoining. Employed until October 1st; have had experience both north and south. Box 318, Canada Lumberman, Toronto, Ont. 17-20

BUSINESS OPPORTUNITIES

Mill For Sale

A first class mill, well equipped and excellently situated on Lake Temiskaming—fine shipping facilities—immediate sale. Apply to P.O. Box E., New Liskeard, Ont.

For Sale

Planing Mill, Lumber and Coal Yard, in Western Ontario, doing good business; good reason for selling. Box 292, Canada Lumberman, Toronto, Ont. 14-17

Wanted

Good man with saw mill to cut out timber limit which will last from five to eight years. For particulars apply to Parker Bros., Parkersville, Ont. 17-18

For Sale

100 acres first-class hardwood timber and water power sawmill, 45 horse power, as a going concern. W. M. Tolton, Maple Valley, Ont. 17-20

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

FOR SALE—As a going concern, the Markdale Veneer Works, 7-foot Panesville, Rotary Machine, with complete outfit and power. Large Cement Vats, Drying Racks, neat buildings. Plenty of yard room; convenient to C. P. R. station.

MARK ARMSTRONG,
Markdale, Ont.
16-17

Here is a Snap

Saw Mill and Timber Limit for sale, on Grand Trunk Railway. Easy to lumber limit, contains four to five million feet mixed timber, besides a large quantity of standing and lying dry pine; two million feet free from Crown dues. Mill now running, equipped with trimmers, double edges, slash saws, lath and shingle mill. Price 8,000. It won't cost much to come and see this outfit; it is a bargain. Write Box 37, Barry's Bay.

14-17

For Sale

Timber and Timber Lands, Saw and Shingle Mills, Etc

Some 2,000 acres, greater part virgin timber, situate on Temiscouata Railway, Township Witoworth, P.Q.

Eighteen miles from Riviere du Loup, Station on Intercolonial Railway.

These lots of lands consist of White and Black Spruce, Hemlock, Maple, Birch, Cedar, Ties, and thousands of cords of pulpwood, etc., with saw and shingle mills actually in operation and in complete order.

These are Crown granted lands, including about 30 acres cultivated land and divided by half each side, face to face, by Temiscouata Railway, with siding two hundred feet from the mills, dwelling houses, other buildings. No export duty to be paid. Apply to

M. DESCHINES,
Fraserville, P.Q., Canada.
15-18

Wanted

Large American firm manufacturing the most up-to-date dry kiln system for drying lumber, wants to secure reliable Canadian representatives. System patented in Canada and several installations made. Apply E. J. MacIntyre, 4059 Perry Street, Chicago, Ill.

17-18

For Sale

170 ft. 1 in. good basswood short, 2 to 5 ft.
11 M. ft. 1¼ in. good basswood short, 2 to 5 feet.
14 M. ft. 2 in. good basswood short, 2 to 5 feet.
50 M. ft. 1 in. M. C. Ash.
50 M. ft. 2 in. M. C. Ash.

GEO. C. GOODFELLOW,
Montreal, Que.
c

For Sale

Saw mill of 10 to 15 M. feet daily capacity, complete with planer and matcher combined, also lath machinery, with 400 acres of timber situated at Dillon Port, with a home market in the midst of a growing tourist section, which is just in its infancy. The P. S. L. Co. is offering for sale several berths of pine most convenient to this mill. For particulars write to Jacob Miller, Dillon Port, Ont. 17-18

MISCELLANEOUS

250,000,000 ft. standing timber, 40 per cent. Cedar and Cyprus, on Burard Inlet, within sight of Vancouver City. Apply to J. A. Russell, Vancouver, B.C., or James W. Bettes, Winnipeg, Man. 16-19

FOR SALE

On Georgian Bay, two and one-half million ft. Pine, $11,000. Also two and one-half million ft. Hemlock, and three million ft. of Hardwood, 850 acres, 7 miles from railroad, $2,500. Apply to Box 308 Canada Lumberman, Toronto, Ont. 16-19

For Sale—Valuable Timber Limits

Containing about 115,000,000 ft. of spruce and pine; good driving on the Highwood river and Sheep river to the yards at High River and Okotoks, which comprise 315 acres of valuable land, two mills in good condition, with daily capacity of ninety thousand feet. Complete logging and lumbering outfit, 40 horses,. etc. Apply

Lineham Lumber Company, Ltd.,
Okotoks, Alberta.
17-20

I HAVE FOR SALE ON THE PACIFIC COAST

In Tulare County, California. A choice compact tract of 275,000,000 feet of redwood and 125,000,000 feet of sugar pine, nicely located to operate and can be marketed in Los Angeles, California. I want a buyer in the next six weeks. Can be bought at a bargain.

L. VAN WINKLE,
Santa Monica, Cal.
14-17

Notes on Saw Sharpening

In filing a saw, begin at the bottom of the tooth and work up to the point, so that the pitch of the tooth shall always be kept the same. There is no use to sharpen the point of the tooth and work down to the base, for if you do the teeth will be out of shape in no time, and then the saw will not run straight—the great trouble with many using bench saws, if they bind in the guage, to drive the piece through if possible. Nothing can be more foolish, as the very best saw may be spoiled in one cut, for it will be bent over the collar, and will likely be buckled or warped. The saw gets hot just above the collar, and becomes a trifle softer in consequence, and it stretches from this point out to the rim, dishing it more or less. There are but few men running bench saws that know much about them. If a saw goes well, all right; but if there is any trouble they call it hard names, instead of fixing it. Hard names will not make a saw work smoothly. More saws are spoiled from carelessness than from hard work. Theory may do something for saws and sawing, but to come down to a fine thing, a person may come into daily practice with them, taking them as he finds them, and using his best judgment in every case, and very often then he will find himself at his wit's end to overcome all the difficulties he meets with. If a person using a saw in the first place saw that he had a good straight plate, and in the next saw that it was round on the points of the teeth, and square across, and then filed every tooth alike and just the same bevel and shape, and kept an even set in it, unless he abused it, he would not find much trouble in sawing.—F. T. H. in The Timber Trades Journal.

Artificial Wood for Matches

A process for the manufacture of artificial wood from straw or dried grass, now in the experimental stage, was shown recently by Mr. Louis Carre, of 24 Mark Lane, London, E. C. At the outset it is proposed to utilize the process for the manufacture of matches, for which it is claimed to show considerable economy as compared with the cost of the methods and materials at present employed. For this purpose the straw is passed longitudinally through a pair of crushing rolls, and then between a pair of cylindrical cutters which divide the flattened straws into strips. The surfaces of the cutters are deeply serrated, and are placed together so that the groove of one cutter receives the raised ring of the other. The straw, supplied with an adhesive, is fed to a traveling band, and is inclosed on top and underneath with layers of paper. The layer of straw and the paper is passed through a pair of rolls under pressure, and then between a pair of endless chains, one upper and one lower, the links of which form metal molds, and are constructed with longitudinal gooves, the edges of which meet opposite one another. The molds are heated, and are pressed together for a sufficient time to enable the agglutinant to harden. After passing between the chains the straw and paper issue in the form of a layer of round splints, which after being cut into the requisite length for matches are dipped into the ignitable composition.

Theory of Belt Drive

After conducting over 1,000 tests, Professor Kammerer, of Charlottenburg, Germany, reached these conclusions:—

The effective pull on a belt is not reduced so much by centrifugal force as the currently accepted method of calcuuation would lead one to expect. In other words, the maximum allowable tension in a belt apparently increases with the speed

The coefficient of friction increases with the speed and reaches values far above that usually assumed.

The maximum efficiency of transmission is not limited by the speed.

The coefficient of friction is larger for large pulleys than for smaller ones.

A wooden pulley has a higher coefficient of friction than an iron one, at least when new.

Transmission is more efficient and the coefficient of friction is higher when the smaller pulley drives.

A belt operates with higher efficiency and usually with less creep when the tight side is on the bottom.

A properly-placed idler improves the efficiency of transmission.

The neutral layer is symmetrically located in the belt so that the effective diameter is the sum of the pulley diameter and the thickness of the belt.

At any speed the sum of the initial tension and the centrifugal force is constant.

Adjustment on Bearings

It need hardly be said that all bearings should be carefully and systematically adjusted at regular intervals, as neglected bearings mean lost power and indifferent work. Self-lubricating ring, ball and roller bearings have latterly been considerably introduced, and now play an important part in the economy of an up-to-date saw mill. The best time to adjust bearings is immediately after they have finished work for the day, as they are then expanded from the friction of working, and are in their running condition. If bearings are adjusted and tightened in the morning before commencing work, which is usually the plan, they are cold and therefore contracted. Lubricate all bearings well with a mixture of grease or oil and finely powdered graphite or plumbago, increasing the amount of graphite according to the strain or pressure on the bearings. If there is undue friction on ordinary bearings particles of metal will be found in the oil after using if it is spread on white paper. Replenish all lubricators before starting work, and guard all bearings as much as possible from dust.

M. P. B.

Sawing Timber in Cold Climates

Both saws and timber are largely affected by frost, and certain precautions are necessary in cold climates to secure effective working, says the Timber Trades Journal. As regards circular saws, when subjected to severe frost they become 'slack' or weak in the centre, and appear more or less "tight" or rim bound at the periphery. This arises from the rim being larger—and having more metal—than the centre of the saw, its contraction is greater, and the tension of the saw is thus considerably altered. Before commencing to saw frozen timber the frost should be taken out of the saw by means of hot water or friction. Select a stout, well-supported tooth adapted to the wood, and run it with as little set as may be. Give the saw a little more lead than is usual in sawing softwood, as it is more apt to run out with frozen timber, and heat the body of the saw, which may become slack.

Saws and Files

A dull saw may not be a sign of dull wit, as it may be due to hard work, but the using of a saw while it is dull is the sign of want of attention. A fairly good rule to go by is that of a dull saw being a dangerous saw. A dull saw will catch and kick quicker than a sharp saw, just by reason of its dullness. A few moments with a file may save some ugly jolts from a bench-saw or a boxboard table-saw, for instance. Where work has to be sawn by hand, sharp tools go a long way toward making it easier.

Although running belts at short centres is very bad practice, owing to exigencies of site it is sometimes compulsory. In this case, in addition to using large pulleys and wide belts, the employment of two belts, one working on the top of the other, can be recommended, as by this arrangement a considerable amount of power—amounting in some cases to nearly 70 per cent. —can be gained. It need hardly be said that to secure the best effect the belts must be kept pliable and in good condition.

Review of Current Trade Conditions

Ontario

The volume of trade in the lumber business in Ontario to-day is considered fair, for this time of year. Business is going along in a steady fashion, especially in the cities and larger towns, although in the smaller towns dullness, as a rule, prevails. Farmers are now getting through their harvest operations, and it is expected that they will soon come into the market and spend some of their earnings on lumber, for improvements for their barns, and other buildings. Stocks in the country yards are rather low, as dealers have been ordering largely in a hand-to-mouth manner. There is little or no lumber moving out, to the United States, as everything across the border is at a standstill, until they learn the results of the reciprocity campaign in Canada.

Deliveries from the mills are rather slow, on account, largely, of the fact that manufacturers are handicapped by a shortage of labor. They are apparently unable to keep up to their shipping orders.

The market for hemlock is on a steady basis, with rather an encouraging demand. This, of course, applies at present, only to Ontario, as the demand in the United States has practically disappeared for the time being. There is a good demand for lath, which is natural at this time of year. Prices are unchanged and firm. B. C. shingles are quiet and trade is rather dull. There is a steady movement in red pine, and prices are unchanged.

In the hardwood trade the usual summer quietness has been in progress. Most of the lumber moving is being shipped on orders taken earlier in the season. There is a fair market for elm, ash, birch, and maple, with the demand about as usual. Although the hardwood trade is quiet it is no more so in Canada than is usual at this time of the year. In the United States, however, it is very dull. A scarcity is reported of 6/4 and 8/4 1st and 2nd birch, and the price has stiffened, being now about $38. The same price is quoted for soft elm, of a similar size and grade, stocks of this wood also being scarce.

Eastern Canada

An active business in lumber is reported by most of the Montreal trade. The building activity is responsible for a good deal of the improvement which has been noted of late. The betterment applies to practically all descriptions of lumber. One firm reports that it is doing the best business it has had for several years, and believes the prospects are excellent. Demand continues strong, and prices are firm, especially for spruce. The inquiry for pine is strong and stocks are not plentiful. Hardwood seems to be a trifle slow. The trade with the United States, of course, is not very active, as the reciprocity situation is disturbing matters. Export business to Great Britain has been disturbed considerably by the labor conditions in the old country.

At Boston the market for eastern spruce continues quiet, but the early fall is expected to show an improvement. Manufacturers' prices are firmly held, without any advance. The price of frames is about $23.50. The yard trade is reported slow, although retailers are a little more active than they have been of late. Random is held a little more firmly. Boards are only in moderate request. A fair amount of new business is reported in hemlock. Eastern clipped boards are selling at $19, which is a pretty fair price. No important improvement is noted in shingles at Boston. Choice extras are offered at $3.55 to $3.60, but business at these prices is dull. Most of the orders are being placed at from $3.35 to $3.40. Lath are slow, but prices are firmer, and an improved business is expected. The price of 1⅝ inch varies from $3.75 to $3.80, and 1½ inch is sold at $3.40 to $3.50.

At New York there is very little future buying of eastern spruce. Prices are somewhat easier, though an improvement is looked for in the fall. Hardwoods are in steady demand, and firm. Ash, maple, and birch, are strong. Beech, and chestnut are in fair demand. The trade in hemlock is slow, with keen competition, and prices unsteady.

Great Britain

The returns issued by the Board of Trade for the month of July, 1911, make an unsatisfactory comparison with those of the preceding months of the year, and show a considerable falling off, as compared with July, 1910. The imports of wood, hewn and sawn, declined by some £77,000, and the decrease in the quantity was about 88,000 loads. This can no doubt be largely put down to the troubles in the shipping trade. F.o.b. markets for lumber are uniformly quiet.

At London the strike movement has put the lumber business practically at a standstill, so far as the moving of timber goods by land or water is concerned. No matter how speedily a complete settlement may be secured, the loss already sustained will be considerable. The deliveries for the week ending August 5th, compare favorably with those of the corresponding week of last year, showing a total of 7,381 standards, as compared with 7,404. The total deliveries from January 1 to July 29 were 172, 862 standards, as compared with 161,929. The hardwood trade has been unusually quiet, being interferred with by holiday conditions, and labor difficulties. The port of London Authority have decided upon constructing a new deep water dock to be known as the South Albert dock. This will increase materially the facility for loading and unloading large vessels. The work will be commenced early in 1912, and will occupy five years.

Trade at Liverpool is reported in a state of stagnation, as a result of the successive labor troubles. It is expected, however, that with the settlement which has now been reached business will quickly improve. The labor disturbances in Lancashire and Yorkshire had naturally a serious effect upon the market for spruce deals from New Brunswick and Nova Scotia. Sales to arrive from St. John, N. B., have been made at about £7 17s. 6d., c.i.f. for Liverpool, and other first-class ports. The prices from Halifax and other ports of Nova Scotia have been upon the customary reductions according to specifications. The regular importers have been handling the usual quantity of lumber from Montreal, but have experienced difficulty on account of the strike, in forwarding the goods which they have sold to buyers. The c.i.f. market for spruce deals shows little or no change, with very few new contracts entered into. Birch timber is fairly steady. The spot values for Quebec and St. John shipments are firm, although the demand is somewhat smaller and stocks are fairly plentiful. There is a steady demand for birch planks and boards, and prices are firm. New arrivals from Halifax and St. John are sold readily, and there is a fair enquiry for Quebec stocks of planks and lumber.

The timber trade at Manchester has suffered as much as that of any other part of the country, on account of the strike. Spruce deals have been added to stock more extensively than last year. The stocks at date of August 12 were some 4,000 standards grater than at the same time of the year previous. The case and box making trades are reported busy, with a prospect of continauance of activity until at least late in the autumn. The f.o.b. market at Bristol is in a rather uncertain condition.

The imports of timber at Glasgow, from Montreal, are reported heavier than for some time past. Business, however, continues dull, and there are no important signs of improvement. The shipbuilding industry is in an excellent condition and if any improvement occurs, it will probably commence as the result of this activity. The movement of spruce is slow, and most of the recent arrivals will go into store. The trade in yellow pine deals is also quite dull.

No improvement can be reported in the timber trade at Southampton. The consumption for this time of year is very moderate.

The Canadian Trade Commissioner at Glasgow, under date of August 2nd, reports as follows regarding the timber trade:—

"Business in this district has little more than started after the holidays. Imports into the Clyde recently have been rather heavier than for some time past, and have included a full cargo of Nova Scotian spruce for Glasgow, a cargo of pitch pine into Greenock, together with small shipments of birch by the liners from Montreal.

"The demand for birch, both in logs and planks, has this year been fairly active, practically every shipment having been sold without difficulty from the docks. Numerous inquiries are still in the market. With pine and spruce, the reverse has been the case and light though imports have been, they appear more than ample for the existing demand.

"In view of the expected rise in freights, an unusually light autumn import seems assured, there being nothing in the position here to encourage shipments, so that an advance on present prices may be looked for before very long."

United States

Continued steady improvement is reported from many of the large lumber markets of the United States. Inquiries and sales have increased in many cases and this applies to both soft and hardwoods. Apparently retail dealers and consumers are working as close to their stocks as possible, so that the outlook for fall trade is considered encouraging. Good and medium grade lumber is generally held at firm prices and this, taken together with the small stocks in retailers' hands, is expected to bring about an active movement, during the early fall.

Chicago.—Consumption of lumber is increasing gradually. Northern pine mills are reported to be expecting a rush of retail orders. Crops are about normal. The hardwood market continues to improve. Plain and red oak, and red gum are most active. Quarter sawed oak is rather dull. There is a plentiful supply of most grades

of basswood, and prices are rather uncertain. Birch and maple are the leading northern hardwoods, with a fair demand and firm price. The hemlock trade is improving, and wholesalers are obtaining satisfactory orders. Both the suburban and city trade is active, and price concessions are not so numerous as they were. The retail demand is not quite so encouraging as might be expected, with the good crop outlook. There is a slightly better demand for fir, spruce and cedar, and prices are expected to stiffen during the fall. The demand for western pine is only moderate, but the indications are for a slight improvement. The volume of trade in southern pine continues large, but the situation is rather uncertain. The railroads are expected shortly to come into the market and improve the demand. There is an increase in the general volume of business, and the preference seems to be for mixed car lots. Retail stocks are short. The inquiry for red cedar shingles has not improved from the country yards during the last fortnight. Quotations are unchanged. There is a fair demand for white cedar, at firm prices.

Buffalo.—The trade in northern pine is very much of a hand-to-mouth character, although the volume is fairly large. Prices as a rule are reported low. The planing mill strike has had a bad effect upon the building trade. The country yard trade is improving. At North Tonawanda a decided improvement is reported in northern pine, with the planing mills usually busy. Prices, however, continue low. An increased demand is reported for box, and most of the upper grades. The medium grades are also fairly firm. The hardwood trade is rather dull, and is expected to continue so for a short time. An improvement is expected about the middle of September. Plain oak is firm and quartered oak is easier. Common birch is supplanting the better grades to some extent, on account of the shortage of supply of the latter. Hemlock is quiet, so far as the Lake stock is concerned. Prices are unchanged, and rather low. Prices of longleaf southern pine continues firm, as a result, it is believed, of the southwestern mills curtailing their output. Shingles are firm and unchanged. The trade is rather quiet, but receipts also have been smaller.

Bay City and Saginaw.—The market for northern pine continues steady with a fair amount of business in progress. Prices generally are firmly held, especially for the better grades, and stocks are being replenished steadily. Continued activity is reported from the planing mills, and other lumber working plants, including the box plants.

Market Correspondence

Ottawa Trade Continues Quiet

Ottawa, August 22.—The lumber business in the Ottawa Valley remains quiet as far as selling is concerned. The local demand continues good and prices are quite as at high as any time during the year. A large number of buildings will be erected this fall in the city and vicinity and accordingly the local planing mills which cater to this business expect all the work they can handle for the next few months. The American market remains slow, although some of the manufacturers are inclined to think that it is better now than a month ago.

The trade with Great Britain was to a great extent interfered with by the recent strike in that country. Export firms were unable to get ships to carry the lumber to England. This, to some extent, stopped their buying as well as their shipping. The South American market is good. The manufacturers' prices are practically the same as they were in June.

All the local manufacturers are preparing to cut as much, if not more, this year than last. As an indication that there will be a falling off by some firms the employment agents report that there is a decreased demand for bushmen from the Georgian Bay district, and some of the firms located in the upper Ottawa are for some reason or other engaging less men. Those who keep a close tab on the situation credit this to shortage of timber lands held by these firms. The big firms, however, are preparing for a heavy season in the woods.

Several parties of lumbermen have left Ottawa during the past two or three weeks to prepare the way for winter activities, arranging shanties, etc. The wages paid so far by the agencies range from $27 to $30 a month, which is higher than offered at the same time last year.

However, it is expected that wages will go even higher when the fall rush starts. There is a general tendency not to send men into the woods as early as was the practice in former years. The advance parties last year were in the forest by the 20th of June, but this season none went before the first week of August. The employers agree that it would have been better had they waited even a week later. The extreme heat under which the Ottawa Valley suffered during the first week of August made it impossible for the lumber jacks to do any work when they had reached the scene of action.

Some of the Pembroke mills have had to close down owing to the scarcity of logs. They were complaining that their logs are not being brought down fast enough. The majority of firms along the river have no trouble, however, from this cause.

The water in the Ottawa River is again low, very low, in fact, for August. Already the power owners at the Chaudiere have begun to curtail. It is deemed a better policy to start in time and avoid water famine later.

There continues to be marked activity at W. C. Edwards' mills, where great construction work is under way. The large box factory built of reinforced concrete will be ready for operation in the spring. The company are also building a large blacksmith's shop, a machine shop, and stables.

Business Brisk at Montreal

Montreal, August 25th.-So far as local business is concerned, reports are almost uniformly good. The building trade is as brisk as ever,and naturally this has its effect on retail lumber transactions. "We are doing the best business we have had for several years, and prospects are decidedly good," said a partner in one of the biggest firms in the city. "This applies practically to all descriptions we handle," he added With an active demand prices naturally keep firm, and the present outlook is decidedly rosy for the fall trade. Spruce is a good market, while dry pine is sought after, but is very scarce. Locally, hardwood is moving rather slowly.

One or two firms say that business with the States is slackening off, and some lumbermen are inclined to think that thhe coming election will have a disturbing effect. "If reciprocity is carried," declared one dealer, "it will have a formidable influence on the lumber market for about a year, then things will drift back into their old state No good can permanently come of the agreement, which I regard as a foolish pact, and one which will prove eventually detrimental to Canadian manufacturers."

In the Province of Quebec water power at most of the mills is very low, although most of the logs are now down.

The strikes in Great Britain have considerably affected export business, and firms interested in that sectoin of the market report that the disturbances in London and Liverpool particularly have had a detrimental influence on their dealings. Orders for cargoes have been cancelled, and prices have also fallen.

United Kingdom Trade.—Effect of Labor Troubles

Liverpool, Eng., Aug. 18.—Timber, being one of the more bulky articles of trade, in the United Kingdom, has lately been at a disadvantage which has had the effect of limiting the amount of trade done. The country is now in the throes of an upheaval of what is called "unskilled labor," in which term is included the class of labor employed to handle and to load and unload bulky articles. At the beginning of July quite a number of steamers, several of them having timber on board, reached the Manchester docks to find themselves "help up," so far as being able to obtain delivery of their cargoes was concerned. The dock laborers were on strike and cargoes could not be delivered, or if delivered could not be moved from the dock quays. At Liverpool, a strike of dock and railway workers, and of hands employed on steamers, had, similarly, caused a "hold-up" of much freight. These strikes caused a rather serious interruption of business, but traders weathered them, and it looked as if things were going on smoothly again. At the beginning of August a fresh outbreak occurred, in the form of a series of strikes, London also being involved this time. Since August came in, unskilled labor at London, Liverpool and other towns has been in a state of continuous ferment. Strikes and stoppages of work have been of daily occurrence. Railway men who handle freight at dockside stations have been affected principally by the strikes and the result has been an interruption of the movement of goods. Timber being one of the classes of goods commonly handled at the railway stations has been one of the first to suffer and stocks have been kept back which otherwise would have been put on rail and forwarded to customers inland. Some movement of timber from ships to dock-yards and from these yards to customers' yards, has gone on, and will continue, but a serious interruption of the regular course of trade has taken place. It is believed that the strikes will not last long, but the question arises, as to how far the timber trade is likely to be affected by frequently recurring strikes which, though small in themselves, cause much interruption of business. In the more important strikes the demands made by the men have been conceded. Advances of wages have been given; re-arrangements of hours, which have meant a shortening of labor have been

made, and, in some cases, a week's holiday, with full pay for the time given, has been agreed to by employers. With such "good things" going freely, it was certain that other unskilled workers would demand their share of them. They have been doing this since July came in and are still making their demand at the time of writing these notes.

Merchants and importers are now confident that some revision of rates will have to be made to cover the extra cost of handling goods, which the concessions made to the workers will entail. The advances represent from 2 to 3 per cent. per week, per man, on ordinary full-week wage amounts, but this will not be all. More money will be earned as "overtime" pay, and for special work, than hitherto, so that a material increase in the amount earned per worker per week, is now being counted on. This, it will be seen, may amount to a heavy additional charge per annum, on a business, and one which importers and merchants will try to meet in some way. The most natural course for them to follow will be to add the amount of the extra charge to the selling price of the goods, and this course one may expect to find traders adopting as soon as they know how the new scale of payment for labor is going to work out.

Business Rather Better

In London, apart from the disturbance through the new outbreak of labor, business in lumber has shown signs of improving. At the auction sales Quebec spruce, offered, has been sold without difficulty, at prices which may be regarded as fair, current prices. Pitchpine has been in more demand, boards especially, being in request. Planks have sold more readily, at prices ranging from 1s. 2d. to 1s. 6d. the cubic foot. Floorings have been about the quietest class of goods and the slackness of business in these, has been taken as evidence that the building trade in London district is still very quiet. It should however be borne in mind, that house-building is an operation which does not go on continuously. If a building scheme by which 1,000, 500 or 50 houses are to be erected, is to be carried out, when once the houses are up and completed; the scheme is done with, so far as a demand for timber for the particular scheme is concerned. If another scheme is ready to follow; well and good; if not, the building trade will be reported to be quiet, until something else crops up. The trade is very different from the furniture trade or the packing-case making trade; both of which go on continuously. Much building has gone on recently in the London district. Many building schemes have been completed and a compulsory "halt" has been called, as most of the desirable land within easy reach of the city by tram or train, has been built upon. The stoppage now is through a lack of land. Practically all suitable land within six miles of the Bank of Charing Cross station is built upon, and anything further away than that will necessitate a travelling outlay of at least £10 per year, by a resident in one of the newer suburbs, to get to and from the city daily. Such an outlay is a deterrent and builders know it. If they continue to build in the more distant sections it will be with the intention of selling the property as soon as built. Even this business has its limits as most prospective buyers are quite capable of figuring out the annual cost of travelling to and from the city, and the amount of time which will have to be spent daily in travelling between office and home. Building in London is accordingly checked at the present time through the urgency of this "land question." The re-constructional building trade; that which builds new property on existing city sites, is moderately active, and is making a good demand for square and plank derrick timber and for constructional and fittings' timber.

In the furniture and packing-case making trades, business continues good, though softwood lumber is being used chiefly for the cheaper kinds of furniture. Consumption in these trades must increase, in keeping with the economic force and trend of things.

At Manchester, trade is slightly better. Here, builders have a chance of operating as there is expansion room round Manchester, which can be utilized without imposing on tenants a crushing tram or train charge. Building has accordingly gone on with moderate activity and yellow and red pine for inside fittings, and flooring boards, have been in fair demand. Very cheap machine made joinery is being offered freely to builders in the district, so that the whole of the timber wanted is not being prepared in the regular joiners' shops. Still, the demand is there and the timber must be had from some source.

At Liverpool interest centres mainly in the new arrivals of Canadian wood. The demand has improved slightly and the outlook, barring the disturbance through the strikes, is brighter. Quebec yellow pine deals have had a moderately good sale, while New Brunswick spruce deals have moved more freely. Sawn pitch pine has had an active sale, but the stocks of this wood are still heavy. Birch logs and planks have been in good demand. Logs are in fair supply and stocks of planks are within a moderate compass.

Quebec Cullers' Report

The following comparative statement of timber, measured and culled at Quebec, is furnished by the supervisor of cullers' office, under date of August 3rd:—

	1909 Cu. Ft.	1910 Cu. Ft.	1911 Cu. Ft.
Waney White Pine	622,560	438,360	483,920
White Pine	51,840	8,080	1,720
Red Pine	5,680	21,880	6,360
Oak	455,840	67,040	44,160
Elm	61,880	246,800	210,000
Ash	520	1,360	80
Birch and Maple	57,240	40,680	55,800

Foresters' Services in Demand

In spite of the rather poor lumbering conditions of the last season, Appleton & Sewall Company, foresters and surveyors, 156 Fifth avenue, New York, report much work in their line and an apparent willingness among land owners and mill men to expend money in order to arrive at a closer knowledge of their lands. Evidently detailed plans and reports with resultant systematizing of administration, pay. Beside other contracts this company is at present engaged in the mapping of a large tract on the Penobscot watershed in Maine.

A Popular Shoepack Concern

Manufacturing shoepacks for over forty years, with a constantly increasing trade, year by year, is the record held by the Gendron Penetang Shoepack Manufacturing Company, of which Mr. C. G. Gendron is the founder and head. Mr. Gendron may well be called the "father" of the shoepack trade in Canada. For many years Mr. Gendron was in business in Penetang under his own name, but finding his business increasing so extensively that he could not handle it alone, he formed the above named company. He is still president of the new concern, and personally oversees the manufacturing end, with Messrs. Ed. Gendron and A. S. Gendron associated with him.

Sporting. Sample No. 5

Prospector's. Sample No. 17

The company are now turning out over twenty different lines. All stock is made with lap-over seam at the vamp, which is a great improvement over the ordinary closed seam, and makes the shoepack thoroughly watertight. All sole leather counters are used.

The "Penetang" shoepack enjoys a reputation that is finding its way not only throughout canada, but also in other countries. During the last couple of years orders have come from China and Mexico, and Mr. C. S. Wright, of London, England, one of the leaders in the famous South Pole expedition, ordered a pair of "Penetangs" to be made specially for him for the voyage.

The Grand Trunk Pacific have placed an order for 10,000,000 feet of lumber, mostly heavy timbers, bridge materials, etc., with the Victoria Lumber Manufacturing Company, of Chemainus, B. C. The lumber is to be delivered in Manitoba for construction east of Winnipeg, and will be carried east by the Great Northern and Grand Trunk Pacific Railroads. It will require about 50 cars. The first shipment is already on the way from Chemanius. This is a commendable change in policy on the part of the Grand Trunk Pacific, which recently gave rise to a great deal of criticism; by placing an order for 8,000,000 feet with Puget Sound Mills. Inasmuch as the Grand Trunk Pacific receives a large amount of assistance from the Government of Canada it is to be expected that whenever possible they should place orders for material with Canadian companies.

GROCERY SUPPLIES

WHEN purchasing your supplies for Camp give us an opportunity of quoting you prices. We specialize in this business and know the kind of goods that please the cook.

Everything first-class quality and at prices that will appeal to the buyer.

Camp Blend Tea..................	15 cts. per lb.
Natural Figs in 30 lb. Bags........	4¼ cts. per lb.
Choice Hallowee Dates............	4¾ cts. per lb.
Barbodos Grocery Sugar..........	3⅞ cts. per lb.

Two Gentlemen of Verona.

HARRISMETAL
HEAVY
PRESSURE
MADE BY THE CANADA METAL CO. LIMITED
TORONTO

There's the Rub

Shakespeare wrote of that one error in man filling him with faults and you no doubt know by experience that one error in **Babbitt Metals** makes your whole arrangements full of faults.

When we recommend you to use **HARRIS HEAVY PRESSURE** we are advising you to use a **Babbitt Metal** acknowledged to be without an equal for all machinery bearings in **Saw Mills.**

Thirty years experience combined with the highest Metallurgical skill and the greatest care used in the selection of the raw material has resulted in the production of a Babbitt Metal which has reached

THE HIGHEST STANDARD OF MANUFACTURING EFFICIENCY

When you think of **Babbitting,** think of **HARRIS HEAVY PRESSURE,** the high grade Babbitt at a medium price.

It positively eliminates friction, will not Break or Crack in bearings. *Write for prices.*

The Canada Metal Co., Limited, Toronto

The Future of the Lumber Wholesaler

By William H. Shuette

That a longing desire to peer into the future has always characterized mankind we are led to believe from the fact that the most ancient records of which we have any trace give evidence of the ascendancy of those whose special business it was as astrologers, seers, prophets and fortune tellers to predict what the future had in store; and so we, practical business men of to-day, will be pardoned, we hope, for allowing this primal instinct to have its way with us just a little while, as we endeavor to peer into the future to catch, if possible, a dim vision of what it holds for us in our chosen line of business.

At the outset, let us bear in mind the fact that the lumber wholesaler's position is different from that of the wholesaler or jobber in many other lines, by reason of the fact that an increased demand for their goods quickly results in an increase in the number of people who manufacture them, and that the possibility of expansion in the manufacture of many such articles is practically unlimited, while the supply of raw material is constantly being renewed.

The future of the lumber wholesaler is our theme, and let us begin defining the lumber wholesaler as one whose principal business is buying from the manufacturer and selling to the retailer all grades and varieties of lumber.

Then in order to intelligently consider the problem, let us divide the lumber wholesalers into three groups, covering the business as we find it to have developed:

First: The Office Wholesaler, who buys and sells exclusively the product of others.

Second: The Manufacturing Wholesaler who, in addition to buying and selling the product of others, manufactures certain varieties himself.

Third: The Assembling Yard Wholesaler, who buys and sells the product of others, but first assembles it at some vantage point.

Taking up first the position of the office wholesaler, we find in reviewing his past history that he has occupied a prominent place in the lumber business, mainly for the following reasons:

First: Manufacturers of lumber were many in number and widely scattered;

Secord: As a rule, they were far removed from the larger cities;

Third: They were not blessed with an abundance of capital; and

Fourth: Until recent years they were poorly organized.

Thus they were compelled by necessity to market their product through wholesalers who were in much better position to carry on this part of the business, by reason:

First: Of being located in the larger cities, which are natural trade centres.

Second: Handling a variety of woods, they became familiar with the requirements of the trade and knew when and where to purchase, and how to find a market for them.

Third: Were well organized and employed experienced salesmen to visit the trade with regularity.

Fourth: Had the necessary capital and banking facilities to pay the manufacturer promptly, and yet extend to the trade the ordinary terms that prevail in the lumber business.

In view of all these facts, the wholesaler's position was so strong that for many years his end of the business was on the whole much more pleasant, profitable and satisfactory than that of the producer.

That these same conditions still exist, in diminishing measure, is undoubtedly true and probably will continue for many years, but it is an undeniable fact that within recent years a change has gradually made itself felt, and while during the recent depression this has not been so marked, with the return of prosperity we cannot but feel that these changing conditions will again be keenly felt by the office wholesaler, because:

First: It is an undeniable fact that within recent years the timber resources of our country have fallen more and more into stronger hands than formerly.

Second: That the manufacturer is better organized than formerly, and is more fully informed as to prices and market conditions.

Third: The manufacturer is coming more and more to adopt up-to-date selling methods and agencies.

Fourth: That the supply of available timber is rapidly being exhausted, and thus as the years pass the total production must constantly decline.

The field of the office wholesaler is thus being narrowed by these changing conditions, and while the period of large prosperity for him may be more prolonged than we can imagine at present, the time must surely come when, by reason of all the circumstances surrounding his business, he will dwindle into the field of the commission broker or salesman, as has already happened in some sections, and thus the well prospered office wholesaler as we know him will become practically extinct.

Let us next consider the manufacturing wholesaler, he who has been wise enough to fortify his wholesaling by the gradual acquirement of timber resources of his own in one or more of the kinds of lumber in which he deals.

That the manufacturing wholesaler has increased the troubles and responsibilities of his business by this method of fortification is undoubtedly true, and some few have met with disaster in the attempt, but progress along any line is usually beset by difficulties and undoubtedly the last few years of prosperity, were rapidly proving the position of the manufacturing wholesaler, to be the stronger, by reason:

First: Of the increased volume resulting from the exclusive handling of the production of one or more mills, in addition to regular wholesale sales, usually resulting in the growth and extension of the organization and reduction of percentage of expense.

Second: The prestige which the ownership of his own mills always gives to the wholesaler.

Third: The assistance rendered in wholesaling other lines by the ability to control and thus assist the customer in some particular line.

Fourth: The additional profit that should accrue from the manufacture of lumber.

Fifth: The lengthened life of his business.

And with the return of prosperity, we cannot but believe he will again assume the ascendency and that it is an assured fact that the wholesaler, who wisely and judiciously as the opportunity offers fortifies his business by securing control of his own timber resources, will thus by many years prolong the life of his business and augment its profits.

As the years go by, and the timber supply becomes less plentiful, we believe still another element will enter to strengthen the manufacturing wholesaler and weaken the office wholesaler, in that the principle of reciprocity will come to be employed as between various manufacturing wholesalers. A, whose business is largely in a particular section and who manufactures one or more of the varieties he handles, will market a portion of his product in some other section, where he does not care to maintain a selling organization, through B, a manufacturing wholesaler who is similarly situated, but manufactures some other kinds of lumber. Thus these who will be drawn together by this reciprocal relation, and so each prolong the profitable life of the other's business.

If then these things be true, would it not be well for the office wholesaler to be keenly alive to the dangers that menace him as the years unfold, and prepare himself for the opportunity as it may arise, to strengthen his hands by adopting the method that seems most likely to prolong his business life.

And would it not be well, also, for the manufacturing wholesaler to conserve the strength he has so wisely acquired by putting reasonable limitations on the annual output of his own product, by economical methods of manufacture, and above all, by practical reforestation, and thus insure not only to himself a long and profitable business life, but, in addition, provide handsomely for his posterity.

And third, let us consider the position of the assembling yard wholesaler. We do not have him here in our local market, but he is a power in other places which are favorable to his growth and development, and it is not wide of the mark to predict that the day will come when he will be needed here and when needed he will surely be found.

Certain large cities, by reason of their geographical location, natural advantages and transportation facilities, become the logical centres for the assembling yard wholesaler, and in these places he has flourished in the past, still flourishes and, if we read the future aright, will likely continue to flourish, in diminishing numbers, perhaps, as the years gradually witness the elimination of our available timber supply. But the immediate future should and will develop this branch of the wholesale lumber busines, for the reason that as our lumber comes more and more from remote sections, and as the time required to transport it becomes more lengthened, and this inconvenience, intensified as it always is by great industrial prosperity, with its accompanying delays in carriage and lack of transportation facilities, the necessity will increase for the wholesaler who can supply promptly mixed cars of all kinds of lumber, and while the amount of business of this character that can be secured will always be limited by the activity of the other branches, yet the assembling yard wholesaler must continue to flourish long after his brethren, the office and manufacturing wholesalers, shall have run their course.

At Least 400 per cent. Profits!

A company is about to be formed to purchase the Canadian rights for the manufacture of "KULBA" patented in Germany, the United States and Canada, the great and only known preservative of Dry Rot Fungus in Building Material, the greatest preservative of wood in all its various forms of employment.

The advantage of "KULBA" over other similar wood preservatives are too numerous to mention. Every contractor will use it and no other.

EDGINGS

Ontario

It is reported that an assignment has been made by the Capital Paper Box Manufacturing Company, Duke street, Ottawa.

The Capital Paper Box Company, of Ottawa, carried on by William J. Harper, is reported to have made an assignment for the benefit of creditors.

The Rat Portage Lumber Company are contemplating the rebuilding of their sawmill at Rainy River, Ont., which was recently destroyed by fire.

Shortage of logs has been troubling some of the manufacturers at Pembroke, Ont. They report that the logs have not been delivered as fast as they had expected, and they had to reduce their cut temporarily.

The large box factory, built of reinforced concrete at the W. C. Edwards plant at Ottawa, will be ready for occupation in the spring. The company are also building a large blacksmith shop, a machine shop and stables.

The factory of the Canadian Handle and Wood Turning Company, at Lindsay, Ontario, was recently destroyed by fire. The factory was owned by Julius Zimmerman, formerly of Oshawa, and the insurance was about $6,600.

The water in the Ottawa River is having its annual weak spell. During August it was unusually low and the power owners commenced to curtail their use of it. They hope in this way to avoid the shortage which is threatening later on.

The Whalen Land Corporation Limited, Port Arthur, Ont., has been incorporated with a capital of $250,000 to carry on a general land, building and lumbering business. The incorporators are:—Alex. J. McComber and Wm. F. Langworthy, both of Port Arthur.

Becker & Co., of America, Limited, Toronto, Ont., have been incorporated with a capital of $100,000, to carry on business as timber merchants, dealers in pulpwood, wood, lumber, etc. Incorporators are Wm. P. Ryrie, Francis C. Lalonde, and Wm. Mortlock, all of Toronto.

A fire occurred at Fenelon Falls, Ont., on August 19th, when the sawmill belonging to Thomas Connell was destroyed, as well as the shingle mill. As a result some forty hands will be out of employment. A million and a half of shingles, the main mill, and a lime kiln were consumed. The cause of the fire is unknown.

A fire which originated in the drying kiln over the engine house at Fox & Company's sash and door factory, on King street west, Toronto, caused about $1,500 damage, on August 24. The fire was confined to the kiln in which it started, where 50,000 feet of hardwood was drying, and the work of clearing this valuable wood out of the kiln took the firemen over an hour. The engine room was flooded.

The timber on the township of Devine, in Algonquin Park has been sold by Fraser Bros., of Ottawa, to a syndicate in which Messrs. A. W. Smith, of the Colonial Lumber Company, Pembroke, H. J. Bartlett, Orillia; W. D. Lummis, Toronto; and Geo. Gordon, Cache Bay, are interested. The timber is mostly white pine of excellent quality. The price paid was in the neighborhood of $350,000. The logs will be cut at the Colonial Lumber Company's mill, at Pembroke.

Eastern Canada

Messrs. Bedard and Belanger, Armagh, Que, have been appointed curators for Jos. Isabelle, lumber dealer.

The Sash and Door Factory of Charles Marcoux, Fils,, has been destroyed by fire, the loss is practically covered by insurance.

It is reported that E. Ernest A. Tartre has been appointed curator for Michel Bruneau and Fils, Granby, Que., sash and door manufacturers.

An assignment has been made by Edward McElveny, lumberman, of Fredericton, N.B., and a meeting of his creditors was held on August 14.

A public sale was held on August 30 of the right to cut logs and timber on three and a half miles of the Blue Bell Tract, in the County of Victoria, N.B.

The Roberval Paper Company, with capital stock of $3,000,000, of Roberval, P.Q., has secured letters patent in the province of Quebec to carry on a general lumber business.

Engineers have been appointed by the Quebec Government to inspect the work carried on by the Chaleur Bay Mills Lumber Company, to facilitate the floating of wood on the river and tributaries in the county of Bonaventure.

The Campbell Lumber Company, Weymouth, N.S., will erect a new sawmill during the coming autumn or spring. The building will be of brick and cement with a metal roof. It is estimated that it will require 500,000 bricks.

It is rumored that representatives of the International Paper Company and the Manufacturers Paper Company, respectively, two of the leading paper manufacturers in the United States, have taken an option on the water power at Drummondville, Que., and it is understood that they will erect a plant there.

The forest fires which were reported recently from the neighborhood of Shelbourne, N.S., did a great deal of damage. Two lumber mills and thirty-three barns had been destroyed when the latest reports were received, and the Sable River Lumber Company's mills and about 5,000,000 feet of lumber were in danger.

The Wayagamack Pulp & Paper Company, of Three Rivers, Quebec, has deposited plans with the Dominion Minister of Public Works of their proposed developments on the St. Maurice River. Plans include two wharves on Isle de la Poterie, two intake piers for water supply, and a pile wharf to protect the shore.

Tenders for licenses to expire on August 1, 1912, were received by the Surveyor General of New Brunswick, up till August 30, at an upset price of

$20 per mile and stumpage, on five square miles on the Big Forks branch of the Salmon River, Kent County, and three square miles on the North Forks. The licenses included all classes of timber.

The Beaver Board Company, Buffalo, N. Y., who have recently been manufacturing their board at one of the larger Ottawa mills, have decided to erect a factory at Aylmer, Que., on the Aylmer Road. The president of the company is Mr. Wm. McClashen, Buffalo, and the architect is Mr. A. E. Burchard, c/o Beaver Board Company, Buffalo.

Albert Gagnier and Arthur Lefebvre, young shantymen of Montreal, were each sentenced to two years' imprisonment for passing bogus orders on J. R. Booth, the Ottawa manufacturer. The offenders had been employed by Mr. Booth, and came into possession of one of his blank shanty order books. Filling out three, for a total amount of $150, they had them cashed by the Northern Crown Bank. The forgery of the foreman's name made the paper look genuine. A fourth spurious order was drawn up and sent to Mr. Booth, direct, to be cashed. The peculiarity of the signature was detected then. In a week the police captured the men in Montreal and they pleaded guilty.

Western Canada

The National Timber Company, Limited, Vancouver, B. C., have been incorporated with a capital of $250,000.

A new ten-hour record for the Canadian Western Mill Company is 162,000 feet, compared with its former figure of 149,000 feet.

The Heaps Timber Company, Limited, Vancouver, B.C., are erecting a new stock shed at a cost of $10,000 at their plant, 115 Victoria Drive.

It is announced that the Western Canada Sawmills Yards, Limited, will open branches in all towns on the Delisle branch of the Canadian Northern Railway.

If satisfactory arrangements can be made, the British Canadian Lumber Corporation will build a mill at Prince Rupert. This concern has a mill in Vancouver and another near Nelson.

The Cameron Lumber Company, Limited, Victoria, B. C., are applying to the Dominion Government for approval of their plans, site and description of works to be constructed at Victoria, B. C.

The British Columbia Manufacturing Company, which had a plant at New Westminster, has sold out to the Morrison Mill Company, of Bellingham and Blaine. Box shooks will be extensively manufactured.

Bloedel Stewart & Welch, Limited, Vancouver, B.C., have been incorporated, with a capital of $500,000 to carry on business as lumber manufacturers to acquire timber licenses and manufacture all kinds of wood products.

DuBois Lumber Company, of Vancouver, Wash., has begun work on its logging road of the North Fork of the Lewis River. Two sets of logging trucks and a 35-ton Climax locomotive have been placed in operation on the mile and a half of completed road.

The new mill which is being built by the Columbia River Lumber Company, Limited, of Vancouver, B. C., at Sicamous, B. C., will have two double cutting bands and resaw. There will also be a planing and shingle mill. The plant will be electrically driven.

The International Lumber & Elevator Company, Limited, has opened yards and offices at Moose Jaw, Sask., where the headquarters of the company will be. Branch yards will be opened in the country south of Moose Jaw, and in the country around Swift Current.

Theodore Ludgate, of Seattle, has been sustained by the courts in his claim to the lease of Deadman's Island. The matter has been dragging through the courts for years and the property has increased greatly in value. Instead of erecting a mill, as at first intended, Mr. Ludgate will probably build wharves and warehouses on the island.

The Dominion Board of Railway Commissioners held a session at Vancouver, B.C., on August 30th, at which a number of matters which concern the lumber manufacturers of western Canada were taken up. Mr. W. A. Anstie, of Calgary, secretary of the Mountain Lumbermen's Association, presented the interests of the association before the board. The principal questions at issue were the proposed abolishing of the tare weight allowances by the C. P. R., and the publishing of through rates to points on the G. T. P., which the lumbermen have not as yet obtained.

Bonds of the Canadian Pacific Lumber Company, Limited, are being floated in the United Kingdom. The company embraces five lumber operations in this province, namely: the Canadian Pacific Lumber Company, of Port Moody; Anglo-American Lumber Company, Vancouver; Gibbons Lumber Company, Arrow Lake; Barclay Sound Cedar Company, Alberni, and the Rivers Inlet Timber Company, Owekano Lake. Four sawmills are owned. The directors of the company are M. B. Carlin, Victoria; W. W. Fraser, Winnipeg; R. W. Gibson, Victoria; J. D. McArthur, Winnipeg, and Thomas Meredith, New Westminster.

The Canadian Puget Sound Lumber Company, of Victoria, B. C., have let the contract for a new refuse burner which will be about 30 feet in diameter, and 121 feet high, with water jacket. The cost of the burner is estimated at $25,000 and the contract was let to the Muskegon Boiler Works, Muskegon, Michigan. The work will commence at once. The company will also erect a new concrete dry-kiln, adjoining the present kiln, at a cost of $5,000. No plans have as yet been announced, in regard to the intention of the company to erect a large new sawmill. Mr. Hankin, manager of the company, denies the report that negotiations are in progress for the sale of any part of the company's timber holdings at Jordan river.

The Pioneer Lumber Company, of Cardston, Alta., have purchased the lumber yard of the Alberta Lumber and Hardware Company at Cardston. The company are extending this plant to make it one of the most up-to-date in Southern Alberta. Charles Holmes, formerly manager of the company's yard at Claresholm, is in charge of the Cardston branch, which makes the fifteenth yard belonging to the company in Southern Alberta and eastern Saskatchewan. Within the past couple of months also they have materially altered the North Lethbridge yard, making it one of the finest lumber yards in Southern Alberta. Mr. Carlson states that while the lumber trade has been fairly steady, the spring trade of 1912 will be the greatest in the history of the country.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Goodyear Lumber Company, BUFFALO, N. Y.

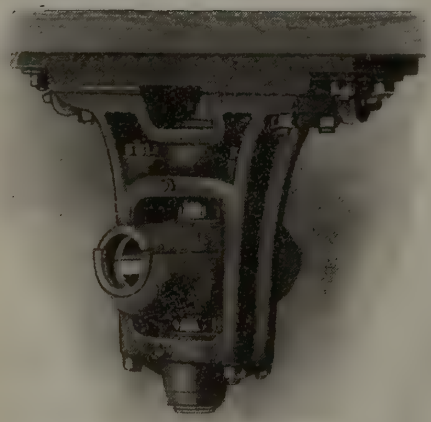
A Combination Hard to Beat



Elmira Ball and Socket Hangers
Elmira Wood Split Pulleys

The Elmira B. & S. Hangers are designed to meet the hardest and most exacting conditions. They are of good weight, correct design, and well proportioned. A Duplex system of oiling is employed consisting of tempered steel rings and woven cotton wick.

The Elmira Pulleys is built to stand the hardest service and most severe conditions. The rim is nailed throughout. The arms are tenoned into the rim and dowelled there. The pulley is guaranteed to run wherever a leather belt will give satisfaction.

HOW DO YOU USE ABSORBINE ?

SOME RECENT REPORTS

Delbert Murphy,
Saskatoon, Sask.,
Dec. 23, 1910.

"Your remedy is a very good one, we used it on a colt we have. It had a very bad leg. It got loose one night and got in a rope and hurt its leg, but it is all right now, since we used your remedy. I thank you very sincerely for your kindness."

Hubert MacDonald,
Rouleau Statn., Sask.
June 20, 1911.

"I am using Absorbine and have used it for years on my horses, and recommend it to everyone. I wrote you last summer, as I had a horse with sprained tendon and you sent me stuff that fixed him up all right."

J. W. Jackson,
Moose Jaw, Sask.,
April 10, 1910.

"Your Absorbine is all that you claim it to be, and must say it cannot be beat, for man or beast."

E. J. Capewell,
Medicine Hat, Alta.
June 20, 1910.

"Have bay six year old running mare that went lame last year on account of splints. Fired her and then used Absorbine and mare became sound."

A GOOD LINIMENT

CAN BE MADE FOR

80 cents a Gallon, 20 cents a Quart

AS FOLLOWS :

Put one ounce of **Absorbine** in a quart bottle, fill one-quarter full with Vinegar, then fill up the bottle with Water, add a teaspoonful of Saltpetre, shake thoroughly together and you will have a good liniment for general use to reduce **Swelling of the Ankles, Tendons, Legs or Shoulders, Collar Galls, Bruises** from interfering or accidents, **Strains** or **Soreness** of the Muscles, Ligaments, Tendons, Loins, or Shoulders, or to sweat down a Big Leg or take out Lameness under bandage, or to do up a Race Horse after a work-out, or to bathe the legs of a Work or Driving Horse after a severe day's work or drive, to rest the horse and prevent soreness.

Use it for all kinds of troubles where a general liniment would be useful, and you will always thank me for calling your attention to this combination.

A trainer with an international reputation said to me: "I could write you a book full of different cases where I have removed swellings, cured bruises and lameness with the above formula." **One bottle of Absorbine will make three gallons of Liniment.**

Absorbine can be obtained of your regular druggist, chemist, or dealer, or I will send you a bottle express prepaid to your nearest express office upon receipt of $2.00, safe delivery guaranteed.

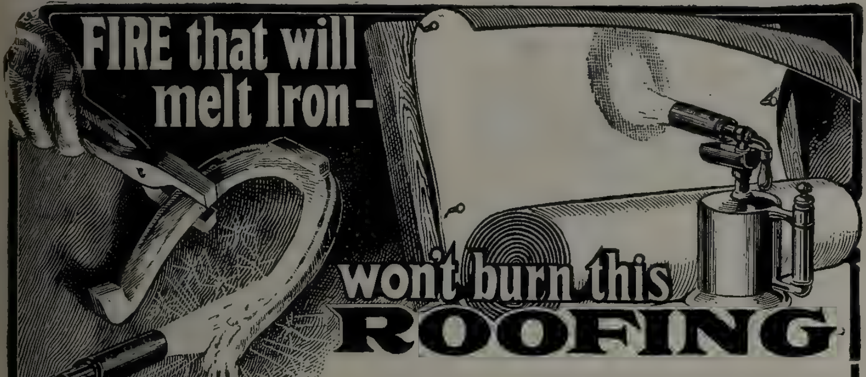
ARE YOU SUFFICIENTLY INSURED?

SPECIAL RATES TO LUMBERMEN



FIRE that will melt Iron-
won't burn this
ROOFING

The flame of a powerful blow-torch—which is intense enough to even melt iron—will not burn J-M Asbestos Ready Roofing when held on *one spot* for nearly an hour. Nor will it set fire to boards underneath. This has been proved by impartial tests made by Fire Chiefs and City Council representatives of many large cities.

J-M Asbestos Roofing is absolutely fire-proof because its base consists of several layers of pure Asbestos Felt. And Asbestos, you know, is the fire-proof, practically indestructible mineral used in gas grates, stove mats, theatre curtains, etc.

These layers of Asbestos (stone) Felt are firmly cemented together with genuine Trinidad Lake Asphalt—that wonderful mineral cement which, in asphalt pavements, stands the grinding of wheels and pounding of hoofs for thirty to forty years.

J-M Asbestos Roofing

is composed of *all minerals.* Not a particle of perishable material in it.

Because of this mineral or stone construction, J-M Asbestos Roofing is also rust-proof, rot-proof and acid-proof. And, like all stone, it never needs painting or coating.

No other ready roofing gives a building such absolute fire protection. None other lasts so long with so little attention. J-M Roofing is still in good condition on many buildings after nearly a quarter of a century of service. Our nearest branch will supply you with J-M Asbestos Roofing if not obtainable at your dealer's.

Write nearest Branch for samples and catalog No. 303.

Twelve men *trying* to move an *empty* car

"Atlas" Car Mover

Patented in Canada in 1901

As shown by the accompanying illustrations will save your mens' time and your money. If it takes twelve men to move an empty car how many will it take to move a full one—it will take one man and an "ATLAS" CAR MOVER.

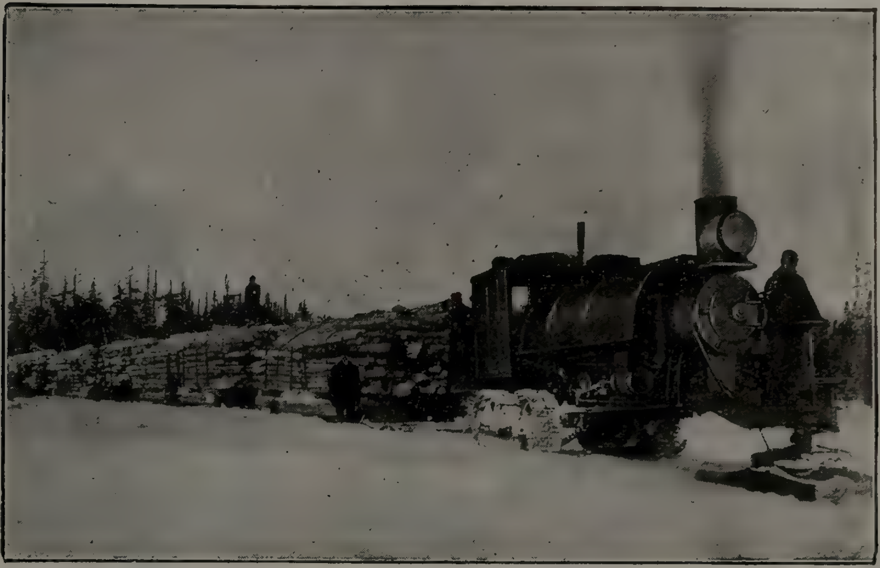
It is a small inexpensive article and every lumberman should own one. Can be shipped from Woodstock.

THE "ATLAS" CAR-MOVER

One man *moving* a *loaded* car with an "ATLAS" CAR MOVER

W. McLeish, - Appleton, Wisconsin, U.S.A.

Up-To-Date Hauling



Every time you install a new method in hauling that will reduce your operating expenses --- you are making more money

The Lombard Steam Log Hauler

is a machine that every logging firm cannot afford to be without. From **50,000** feet upwards can be moved at a single load on average roads and if a little care is taken in improving the road it is more than repaid by the extra results obtained.

In comparing this machine with horses the following points should be considered. It will do the work of from 12 to 18 four horse teams and do it better and quicker, the operating cost is very small and when the machine is idle it costs nothing. It travels at the rate of five miles an hour and will work 24 hours a day if required. Only requires three men to operate it.

Our literature will interest you.

THAT RUNNING WASTE

"Stop, look and listen," is considered the acme of warning injunctions at railroad crossings; and the reason is because it calls every human faculty into action that should enter into the protection of the public, and in turn of the railroad.

Every manufacturer knows that by installing clutches to control machinery instantly, your employees are afforded protection; and, in turn, by shutting down idle groups of machines, you save power. But had you thought of saving power while running—your biggest item. That's where the POSITIVE Combined Jaw and Friction Clutch figures. It will couple a driving shaft at any speed into a driven shaft at rest against full load. The frictions grip until the two shafts come to the same speed; then the jaws engage and drive the load, the frictions releasing.

There is no slipping, no loss of power while running. By the same token, the POSITIVE Clutch will do the hardest duty satisfactorily. If you have a "tough transmission proposition," we want to show you where we have "licked that kind to a frazzle."

The Positive Clutch & Pulley Works
Limited

American Works: Buffalo, N.Y. 11 Jarvis St., Toronto, Ont.

CONSERVATION

NOT FOR SENTIMENT BUT FOR PROFIT

With the increased value of timber lands to-day, owners are beginning to realize the need and importance of systematically handling their lands. Forest holdings can be made to bring a financial return in a remarkably short length of time and for an indefinite period thereafter, by using our methods of mapping, estimating and surveying.

A Large Land Company's Opinion of Our Work

"Just the Information Wanted"

Samuel F. Hersey Land Company,
Bangor Maine.
Branch Office, St. Paul, Minn.
St. Paul, Dec. 22, 1909.

Gentlemen,—

In reply to your inquiry of the 15th inst., we desire to say that the forestry work you did for us this year is entirely satisfactory to us. Your report and map were comprehensive and gave us just the information we wanted.

We shall undoubtedly call upon you again for further services of this character.

Very truly yours,
Samuel F. Hersey Land Co.,
D. A. Mudge, President

Messrs. Appleton & Sewall,
Bangor, Maine.

We are PRACTICAL FORESTERS, make forest surveys, timber estimates, and abstracts showing character and quantity of available timber, indicating the most approved methods of cutting each year so that there shall be no unprofitable depletion, and appraise for present and future worth. Our Booklet F, "Applied Forestry," will be of interest to you. Mailed upon request.

We are pleased to refer you to the Great Northern Paper Company, Bangor, Me.; H. S. Ferguson, Engineer, 200 Fifth Avenue, New York City; Bonne Terre Farming and Cattle Company, Bonne Terre, Mo.; Chicoutimi Pulp Company, Chicoutimi, P. Q., Canada; Kathdin Pulp & Paper Company, Boston, Mass.

Dry Lumber

Like you want it ~ *When you want it* ~

Read This Letter

Woodstock, Ont., Nov. 10, 1910

Grand Rapids Veneer Works,
Grand Rapids, Mich.

Gentlemen :—

In reply to yours of the 2nd inst. would say that your Dry Kiln System has been very satisfactory to us. We have had no difficulty in drying perfectly any kind of material we use except rims. It will dry the material all right but the steam straightens them out. It is the only system in our experience that will dry gum box boards without warping. When we put in additional kilns it certainly will be your system.

Yours truly,
THE BAIN WAGON CO. LIMITED
(Signed) John A. Bain,
Vice-Prest. & Mngr.

We have letters from many more Canadian Factories and Mills which we will send you on request. They will tell you how to

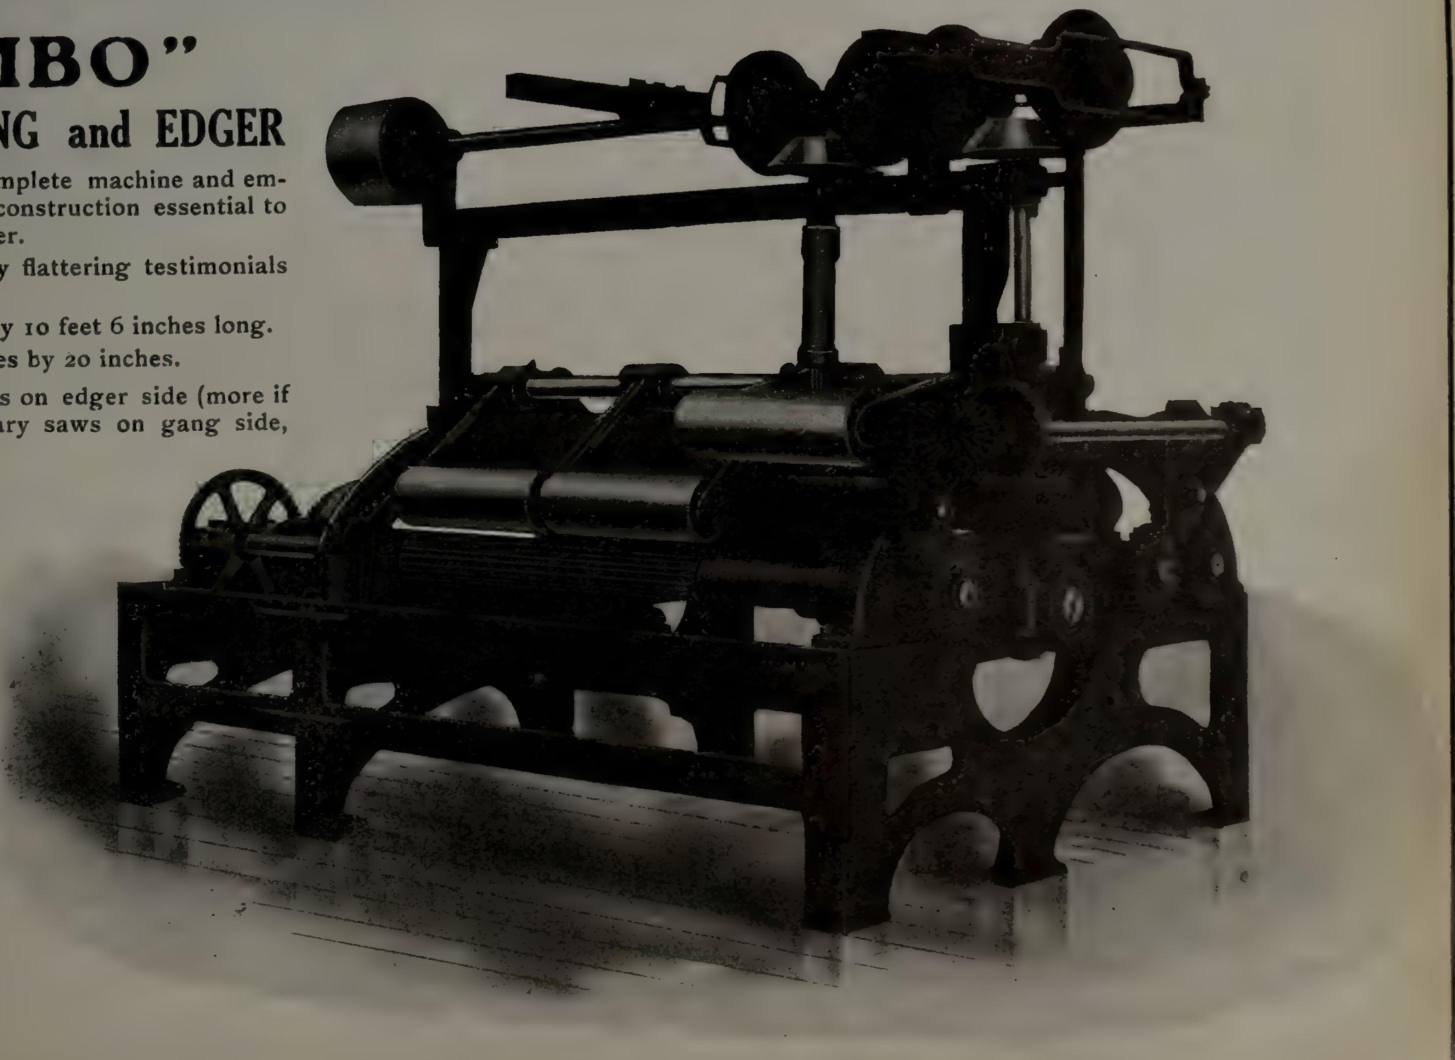
"JUMBO"

Combined GANG and EDGER

This is a very complete machine and embodies every detail of construction essential to an adequate gang edger.

We have some very flattering testimonials for our "JUMBO."

Mandrel: 4½ inches by 10 feet 6 inches long.
Drive Pulley: 20 inches by 20 inches.
Saws: 2 movable saws on edger side (more if desired) 8 stationary saws on gang side, 2 water boxes



Our latest model is an improvement on the one illustrated above.

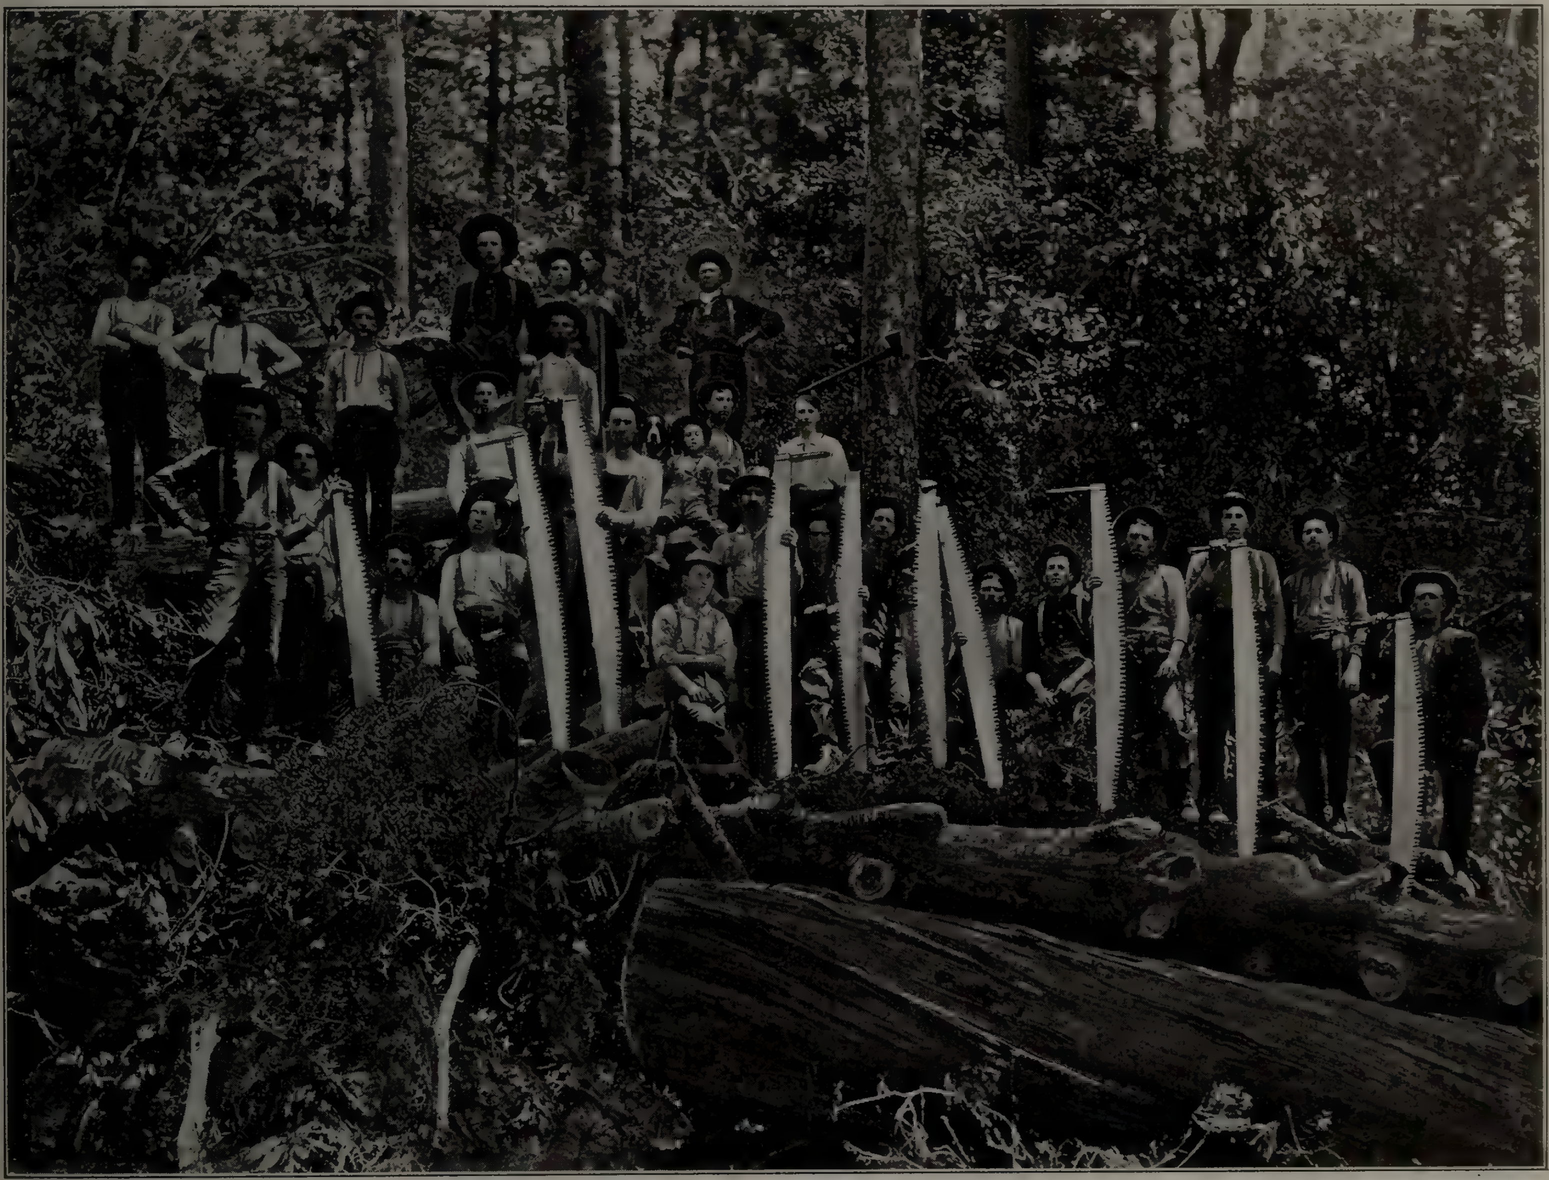
Fenwick, W. Va., June, 23, 1910.

Henry Disston & Sons, Philadelphia, Pa.

Dear Sirs:

Enclosed you will find check for the Crosscut Saws. Will mail you photo of the cutting crew and I will say the **Disston Crosscut Saw** is the best Hardwood and Hemlock Saw I have ever used and I have cut timber all my life.

Yours truly,
C. Markly



In the foreground will be noticed two logs, one of which is of the knurly or spiral grain species, while the other is exceedingly knotty, showing two classes of timber which test the metal, temper and workmanship of saws more severely than any other known class, and as Disston Saws are successfully cutting this kind of timber, it is self evident that they are of the highest quality in every respect, as confirmed by Mr. Markly's letter.

FOR RESULTS USE DISSTON SAWS

Henry Disston & Sons

CANADIAN WORKS: Fraser Avenue, Toronto, Canada

Sanding Fine Furniture Stock

Requires a sander with adjustments easily and quickly made, and with all operating parts so simple in construction that keeping them in perfect alignment does not require expert attention. Every working part has been simplified for this reason on

Berlin
Triple Drum Sanders

No other sander has carried this idea so far as the Berlin, because no other builder recognizes that simple adjustments increase the efficiency of a machine.

Ask for Sander Booklet

TAKE the Drum Adjustment for instance. Each Berlin Sander Drum may be adjusted separately or all of them simultaneously by means of the same hand wheel. Thus drum adjustment is made far more accurately and in less time, than where there are three handwheels necessary.

With the one handwheel all drums may be raised equally at the same time, then the separate drums properly adjust for correct proportion of the cutting. With three separate handwheels all adjustment is a matter of guess work until several pieces are run through to test the setting of the drums.

Even if a new operator were to make poor adjustments of the drums, good stock need not be ruined by taking too deep a cut. He has the reverse at hand to back out the stock. This same lever starts and stops the feed instantly. No other sander built has this feature.

Another exclusive feature of the Berlin is the feed control lever. With this lever three changes of feed speed are obtained as well as starting and stopping. Feed changes on other sanders are made by changing pulley sizes for the different speeds.

Adjustment of feed rolls, press rolls and drums for aligning are simple and quick. It requires only the loosening of set screws and turning up or down the bearing screws to secure perfect alignment. Moreover once aligned they remain so.

No sander part receives harder wear than the oscillators; but this is easily taken care of on the Berlin. The adjustment collars are kept in place by set screws. If any wear occurs in the oscillator box a set screw is loosened and the collar turned so that all lost motion is taken up. No other oscillator part requires adjustment. The oscillator box is cup shaped and will retain oil up to the shaft bottom. Better investigate further.

Operators Should Choose Sanders

Given the chance, operators will choose the most efficient sander, because an operator prefers the machine simplest to operate with drums easiest to cover. After thorough investigation he would like and recommend

Berlin Triple Drum Sanders

One operator may prefer the **spiral** type of drum, another the automatic take-up. He may choose either on the Berlin.

SEND FOR SANDER BOOK

The Berlin spiral drum is well known for its very effective sanding and polishing abilities. Paper is wound about it spirally with edges lapping so that there is no break in the cutting surface. A groove is made in the drum shell and covering to allow of lapping edges without a ridge. Under average conditions this drum is the most efficient built.

The spiral drum does not depend upon automatic means to tighten the paper and keep all slack out of it. Many operators prefer to know just how tight their paper is. These men get better results with the spiral because they tighten the paper to suit themselves, after which no slack occurs.

The Berlin automatic take-up straight opening drum has no competitor in its own type, because of the flexibility of the take-up device. All other drums of this type use straight bars across the drum to clutch the paper, so that in order to take up slack in the paper it must be loose all over. The Berlin flexible device takes up slack wherever it occurs in the length of the drum. No danger of paper folding over, creasing and tearing on this drum.

Paper may be put on either of these Berlin drums as quick if not quicker than the less efficient drums offered by would-be imitators. Another thing—Berlin drums are balanced perfectly. The straight opening drum as well as the spiral is balanced in running condition and cannot be thrown out of balance.

There's a 32-page booklet on Berlin Sanders that all operators and superintendents should have. Send for it at once. It's free and full of information.

Stewart Hartshorn Co. Find Them A Money Maker

They say of The Hussey Dry Kiln Door Carrier "Our factory at Muskegon, Mich. has had them in use for years with such good results that we installed them here. The operation is simple and effective and they *do hold the heat in.* We do not think it possible to recommend them too highly".

That's a pretty good endorsement, but that's only one -- over 1450 of the biggest mills in United States have the Carriers in use, many of them have sent us the second, third and fourth order, they'll pay you bigger dividends than they will them. Let us have sizes so we may quote you a figure.

LOGGING AND INDUSTRIAL LOCOMOTIVES

The knowledge and experience gained in building locomotives of all types, capacities and sizes for every kind of hauling is applied to every locomotive we build, and is available to you.

Our small locomotives for logging, and light switching service are not merely selected from designs previously built, but are special designs to meet special requirements.

They are designed and built with the same care required for 200 ton locomotives. Only the best materials are used in their construction, and every part is made to jigs or templates, guaranteeing that repair parts will fit.

They are constructed with a view to the fact that they must sometimes be operated a considerable distance from shop facilities, therefore simplicity and sturdy construction are vitally necessary.

Fuel cost is always important. This is considered in the design and capacity of the boiler, and in the design throughout.

Write us concerning your requirements or ask for a consultation with our engineers.

We are in position to meet every requirement in locomotives and to supply repair parts at short notice from our Works at Longue Pointe, Montreal, Canada.

OILDAG

(REGISTERED TRADE MAKR)

Deflocculated Acheson-Graphite, DAG, and oil.

Graphite does not dissolve in any liquid or break under pressure and these qualities, added to the unctious softness and purity together with its non-coalescing nature, make Acheson-graphite ideal for lubrication purposes. The process of deflocculation takes Acheson-graphite powder so fine that 99% of it will go through a sieve having 44,000 meshes to the square inch, and subdivides each grain of this finest powder into many still smaller particles—so small that they cannot be seen with a strong microscope. Oildag is this deflocculated Acheson-graphite suspended in oil where it neither floats or sinks but is evenly distributed throughout. Oildag will flow anywhere the oil alone will go.

Mr. Rob't. A. Ross, E.E. of Ross & Holgate, Consulting and Supervising Engineers, Montreal, writes:—

"As my firm are constructing and operating steam plants, we have wished to use a mixture of graphite and oil for cylinder lubrication, but have been prevented by the fact that the graphite settled out of the mixture. This difficulty you have overcome, and we are now assured of the best lubrication in the world, especially in super-heated steam practice."

Write for Oildag booklet 77 E.

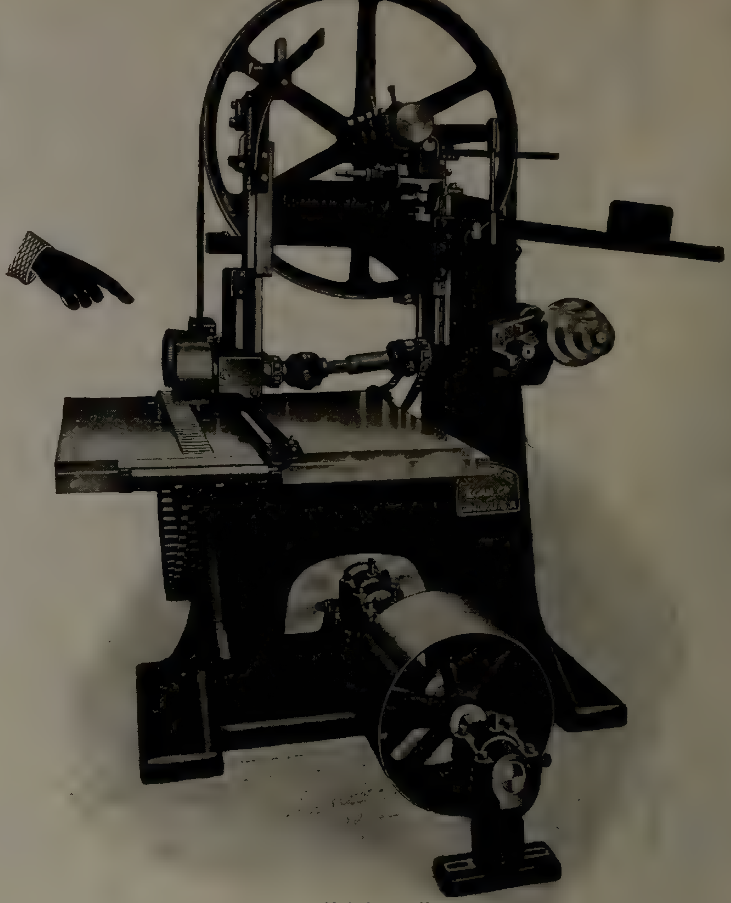
THE CLARK BROTHERS COMPANY, Belmont, N. Y.
Coast Office, White Building, Seattle, Wash.

SEE THAT CHAIN;

it's a dollar and cents proposition for you to investigate if you haven't seen it work. That chain will do your **EDGING** better and cheaper than the circular saw you are now using. The big saving, however, comes in here :—



No 202
Self Feed Band Rip and Edging Saw
Patented 2-27-00—10-2-00—11-19-07—1-21-08

You edge and rip your stock on the same machine saving many hours of rehandling as well as the cost of an extra machine and operator.

THE LIGHTNING LINE

As an Edger the number 202 is far superior to the circular machines because the operator don't have to watch the stock after it is put in. The endless chain, moving in planed ways is operated by sprocket chain and gearing from the same shaft that runs the feed rolls. The cut can't help being straight. Meanwhile the operator can get the next piece ready.

For Ripping the chain drops below the surface of the table. The machine is then an automatic band rip saw of the latest type, embodying the Fay & Egan features, viz, square column, solid lower wheel and knife edge strain, permitttng the use of a thin blade at a high speed. The result is less kerf waste, greater output and reduced blade cost.

Our Band Saw Catalog shows the No. 202 and many others.---Write for it.

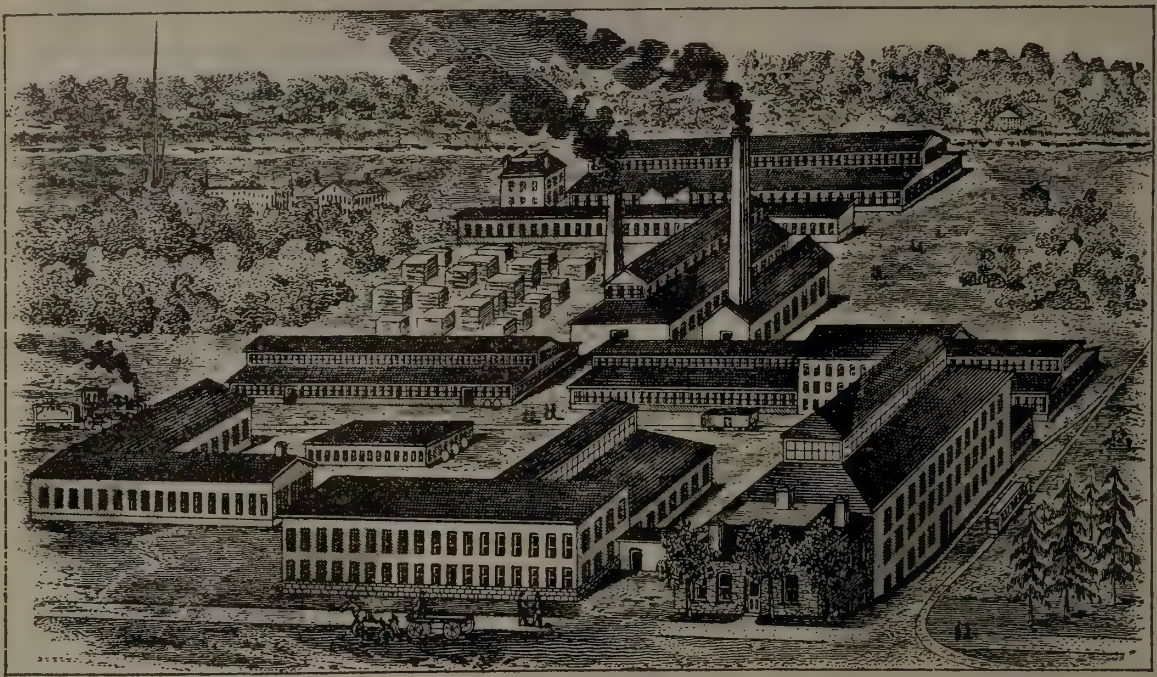
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

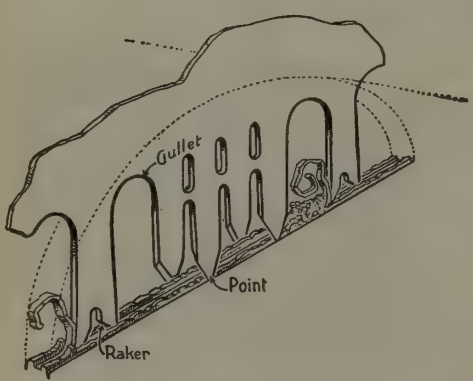


The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario

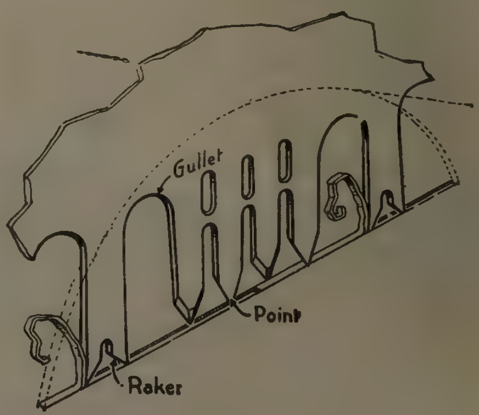


Why Atkins Sterling Saws Run Free and Easy

Saws that depend on "set" for clearance have to tear their way through the timber, like the picture to the left. The teeth are sprawled out on either side and chatter and stick and bind and tear. That's why wood sawing is sometimes considered such hard work. That's-why commonly ground saws can NOT run fast or pull easy.

ATKINS SEGMENT-GROUND CROSS-CUT SAW BLADES are ground thinnest on the center of the back. The teeth are the widest part, and the blade drops easily into the smooth cut which is made by the saw teeth. Very little set makes the teeth cut clean and the rakers clear the center. See the picture to the right. These Saws merely require enough power to pull them back and forth. That's why they run so easily.

ATKINS STERLING CROSS-CUT SAWS are the only Saws that are Segment-Ground, and for this reason are guaranteed to run easier and cut faster than any other Saws. Write us for free information, or order through your jobber or dealer. If they won't supply you, let us know.



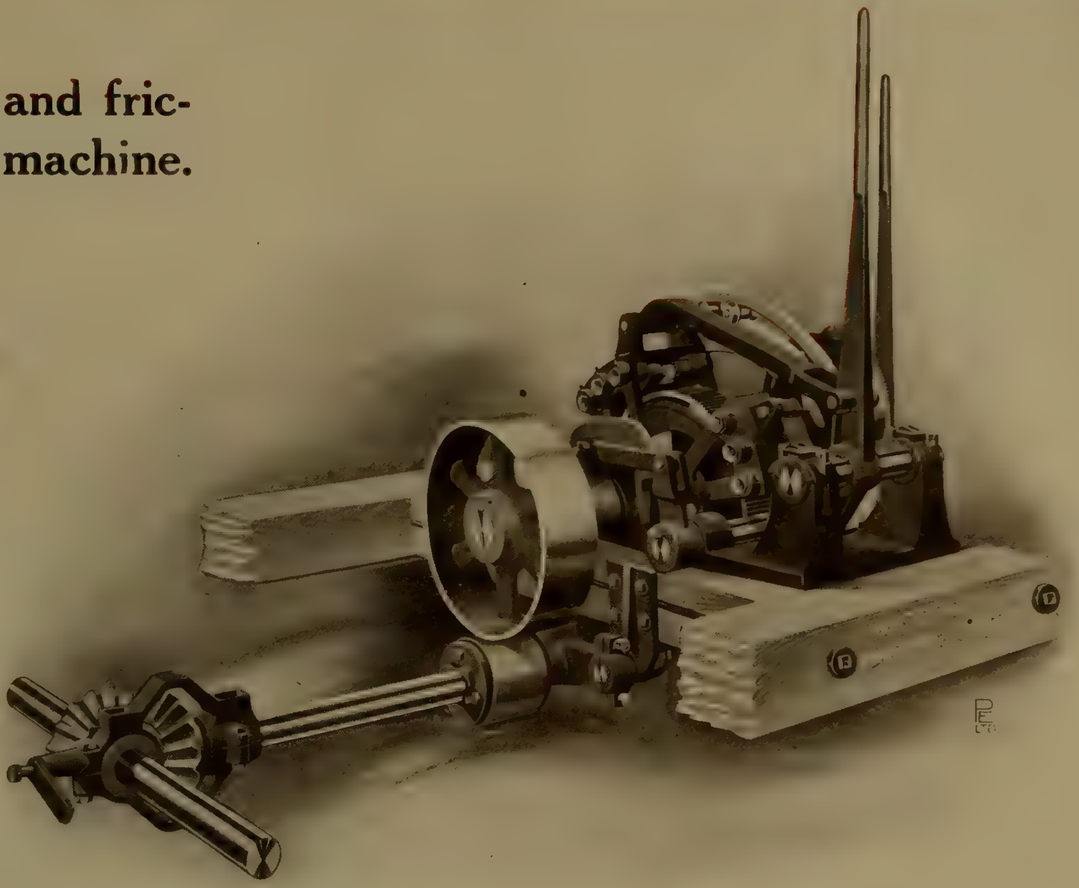
E. C. Atkins & Company

Makers of Sterling Saws - HAMILTON, ONT.

Home Office and Factory, Indianapolis, Ind., U.S.A.

The Waterous Combination Setworks

A setting mechanism and friction receder in one machine. Quick, powerful, safe and absolutely accurate. Can be attached to any rack carriage having set shaft not larger than 2-$\frac{15}{16}''$. Easy on the carriage, easy on the operator and easy on itself.



This Setworks cannot Develop Lost Motion

In the ordinary Setworks the setting lever movement that determines the amount of set is controlled by stop pins placed in a stationary quandrant. As soon as the connections between the lever and the pawl cages become worn, lost motion is bound to develop, and the accuracy of the set is lost.

We overcome this in our Setworks.

The quandrant carrying the stop pins is fastened to one of the pawl cages—on the movement of the setting lever the cages start from the home stop, advance until they strike and then return to the home stop. For the same position on the stop pins the travel of the cages will be the same, no matter how much the connecting links are worn. All wear comes behind the pins and *the absolute accuracy of the set is a permanent feature.*

Other Features

1.—**The friction receder lever** lifts the pawl automatically from the ratchet wheel before receding can commence. This does away with a pawl lifting lever.

2.—**Only two levers are required** for both operations of setting and receding, both are placed most conveniently for the setter, no stooping is necessary. The operator can thus work quickly, accurately and without fear of stripping his ratchet wheel.

3.—**Tool steel pawls** extend full across the 4″ face of wheel, three pawls are carried in each cage, the latter made very wide and open for quick adjustment and to prevent clogging by saw-dust.

4.—**Quandrant is double slotted,** carries our patented knockback pins, arranged to give four standard cuts without shifting.

5.—**Pawls** are arranged to set by 1/32″ up to 3″ at one full throw of lever.

6.—**Every part is made to template,** repairs can be quickly furnished. The setworks can be supplied without receder attachment if desired.

Let us send you our new Carriage catalogue containing full description of this Setworks. Bulletin No. 107.

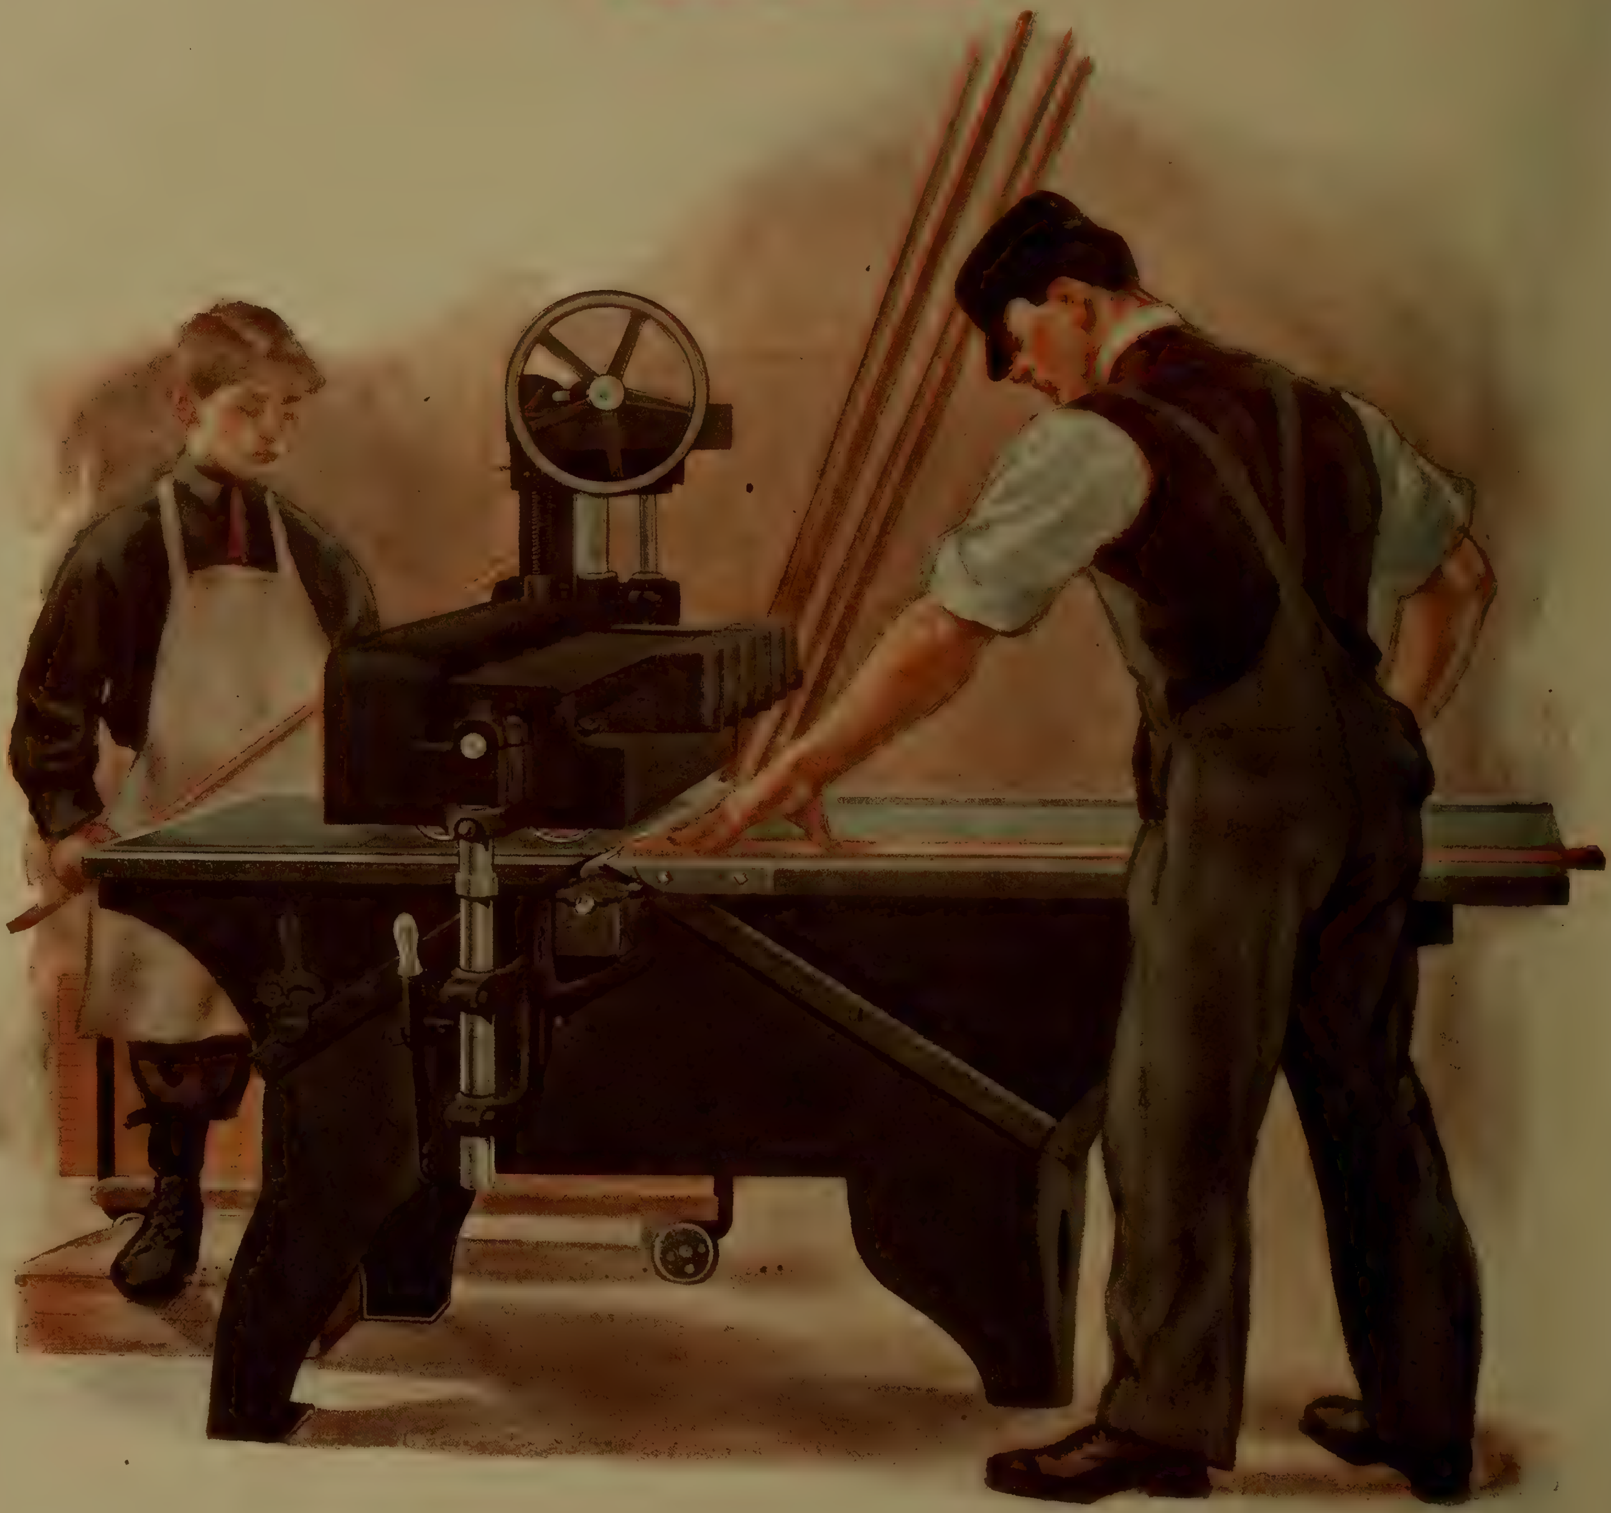
AMERICAN
COMBINATION POWER *and* HANDFEED JOINTER



For jointing crooked stock or taking out of wind, the power feed device on this machine beats hand work a city block. Then you can joint pieces of varying thickness at the same time. It handles the material with as much dexterity as the hands of the skilled operator—and a boy can do the work. Let us tell you about it.

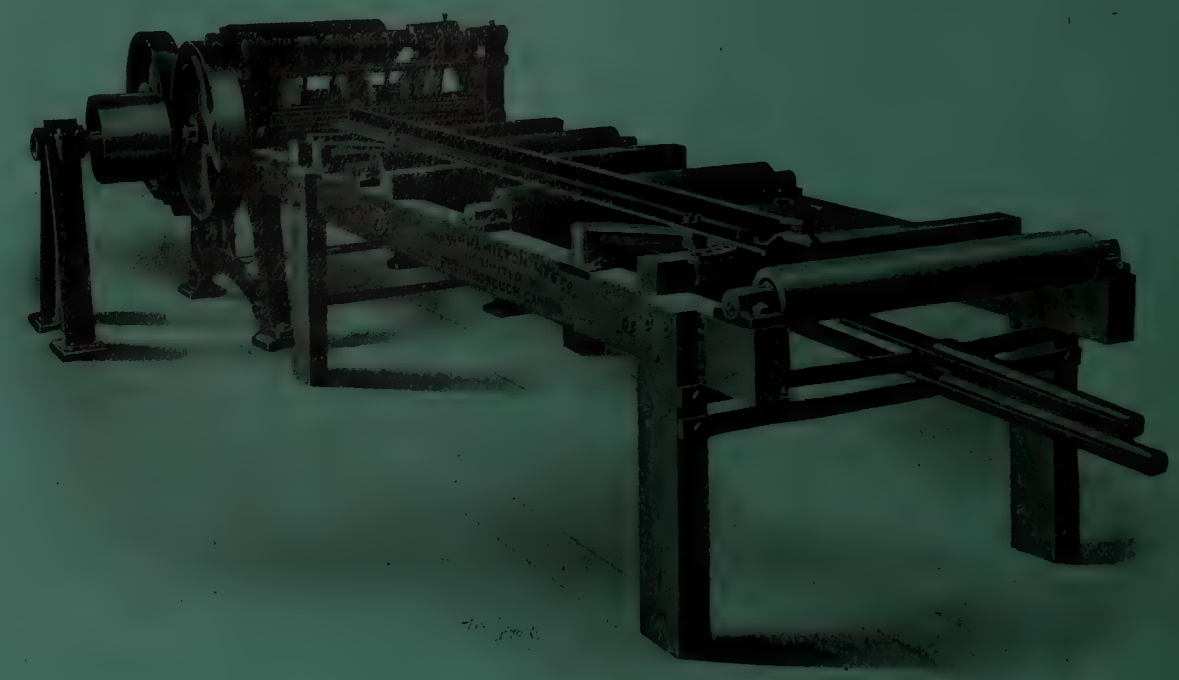
Edgers for Medium Size Mills



Our "Star" Edger has been designed and built speaially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

Made in all sizes up to 40 inches

440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound ; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows : Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

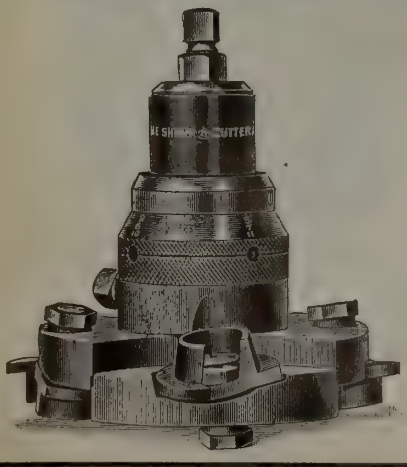
Interchangeable Planing Mill Tools

SHIMER CUTTER HEAD



We Can Supply Your Needs

in Cutter Heads or Special Cutters and at the same time save you money. Send us diagrams and specifications of the patterns you find the most difficult to file to shape in tongue and groove work, Door and Sash Mouldings, Sidings or anything in the planing mill line. We will design Bits that will cut these patterns more accurately, that will cut better and faster, especially in cross-grained and knotty lumber—and *you won't need to file them to shape at each and every sharpening.* We put the desired shape permanently into the contours of the Bits and as long as there is a piece of the Bit left it will cut the exact pattern it did when new.

This advertisement illustrates one of the many styles in which the Shimer Cutter Heads are manufactured. Our catalogue shows a large variety of Circular Bit Heads, both solid and expansion; Square Heads for special purpose, and Combination Heads with changeable Bits for the smaller mills. They are all made in the same perfect manner and fitted to the work for which they are purchased.

We have also adapted the Shimer Cutter Heads to very many special purposes and our fire-proof vaults contain samples and templets of a large variety of special work, all of which has given us valuable experience in designing and shaping tools for odd work.

Thirty days' trial given on any Shimer Cutter Heads we make, so what is to hinder your giving measurements and order to-day?

The dealer who accepts your order for the Shimer Cutter Head and supplies you with another means to deceive you in no small matter. Look for the Name and Trade Mark "The Shimer Cutter Head" stamped on every genuine tool. Any other is spurious—send it back—demand the genuine, of quality and helpfulness, with a record of 40 years of upbuilding and improvement. It costs no more.

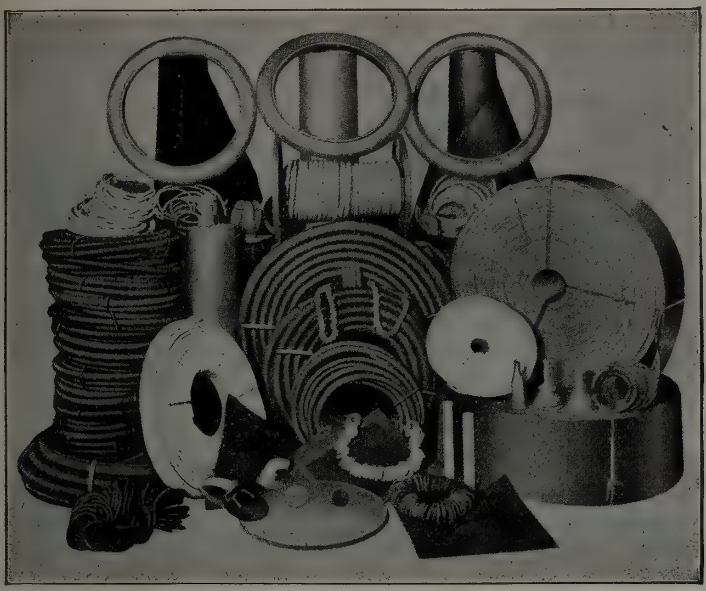
Power-Saving, High-Efficiency Belts

For Planers, Dynamos, Generators, Fan Work, Etc.



A Few of the Lines We Manufacture

Make your Power Transmission an *asset* instead of a *liability*—a money-saver instead of a power-waster. Belt your machinery with

GOODYEAR
Imperial
High-Speed, Friction-Surface
Belts

"The Belt That Clings"

Built the famous Goodyear way, for high-speed pulleys where great tensile strength is demanded

The Imperial has the cling of rubber and the endurance of many plies of hard-twist, long-fibre *cotton fabric,* rubberized, cured and vulcanized into one solid, enduring piece.

Earns Cost—Costs Less

The Imperial Belt is a power saver. It earns its cost by turning into increased production the power and the time lost by slippery leather belting. And it costs less.

Wears Longest Without Stretching

Most economical because it wears longest.—First, because it doesn't slip. Secondly, because it is made by a process that abolishes **internal friction.** This soon wears the life out of best leather belting and is caused by internal **grinding** as the belt bends and whizzes around small high-speed pulleys.

Instead of a few plies of coarse fabric, we build up the Imperial with many plies of fine fabric. After the **stretch has all been taken out,** rubber is forced through and all threads are separated from each other. Thus they can't rub and chew themselves, and the cause of internal friction is eliminated.

These belts are built to suit the purchaser. Let us quote prices on this most durable and economical high-speed, friction-surface, wear-resisting belting.

We also make other rubber products—Tires, Hose for all purposes, Sheet Rubber Packing, etc. Throughout, you get the same high quality materials, skillful workmanship and years of experience that have built such famous service into products of the Goodyear Tire & Rubber Co., Akron, Ohio, U. S. A. Write us at once.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 31 **Toronto, September 15, 1911** **No. 18**

Grading and Inspection

The questions of grading and inspection of lumber have beyond a doubt become of first importance to the lumber trade of Canada to-day. It is a difficult matter to account for the varying opinions which prevail upon the points involved. There are a couple of facts, however, which point strongly to the probability of the movement being a success, if it is once put into effect in a business-like manner. First of these is the fact that there seems to be an overwhelming opinion in favor of such a change, and the second is the fact that even those who criticize the proposal do so largely on the ground of its being unworkable; practically all of them admit that if the plan were found to be workable it would be a distinct benefit to the whole trade.

There was never a progressive movement proposed in any line of work which had not its doubters. The criticism of those who are opposed to the movement on this score, simply goes to show that the problem is one of considerable difficulty, and requires the co-operation of the whole trade to put it into effect. It would be foolish to go in for any plan to establish a board of inspectors, working upon a fixed set of grading rules, unless the movement received the almost unanimous support of the trade. With any number working in opposition to it, failure would be certain. It behooves those who are seeking to bring about the change, therefore, to enlist the support of a large majority of the trade before they take definite steps. That this support will be secured is becoming more and more probable. The enthusiastic approval of the plan which was expressed by a number of hemlock manufacturers in Ontario, at a recent meeting, when they decided to form an association was a strong indication that the trade in Ontario is ripe for the change.

The attitude of the larger manufacturers toward the movement at present is to a certain extent lukewarm. Some of them take the stand that they have with great difficulty, and long effort (spread over a number of years), been able to educate their trade to the grading system which they have adopted. They would object to making any alterations in their grading rules, as they consider that it would mean commencing all over again the work of education, which they have almost completed. In this attitude there is considerable reason, but it is based, possibly, on a mistaken idea of the result of the change which is proposed. The larger manufacturers have worked out grading systems, which in such a district as the Georgian Bay are practically based upon identical principles, and in which there is little or no variation, so far as the important essentials are concerned. Any system which is adopted for the regulation of grades would necessarily be based upon the same principles as those already in use. The class of manufacturer whom it is hoped to bring into line is the man with a small mill in the locality where timber is of poor quality, and who has developed the habit of putting up his lumber in such a manner as to cause confusion in the grades. Some of these manufacturers and the wholesalers who have been handling their stocks have caused endless trouble by trying to grade their lumber higher than its quality justifies. The trouble is by no means caused by the manufacturers alone. Each branch of the trade has its representatives who have taken advantage of the disorganized state of affairs and those who are honestly anxious to improve matters will have members of their own branch of the trade to discipline. The question is one of house-cleaning, and it is a house-cleaning that is badly needed. It is greatly to be hoped that the trade will see it in this light, and decide to make a few sacrifices wherever necessary, in order to insure the benefit of all. Uniform grading and inspection is in successful operation in various parts of Canada, where just as many obstacles had to be overcome before it was introduced. The Canadian cases are no exception. A determined and combined effort should result in success.

The U. S. Retailers' Defence

The recent indictment of fourteen secretaries of retail lumbermen's associations by a Federal Grand Jury of the United States, at Chicago, has made a decided stir in the lumber business of that country. It begins to look as though the outcome of it all will be beneficial to the lumbermen, inasmuch as, when the matter has passed into history they are not likely to be seriously hampered in their proper operations, and are likely to understand far more definitely than they have in the past just exactly where they stand in regard to the legal rights which they enjoy.

One outcome of the state of affairs is that the secretaries of associations who have been indicted have issued an official statement of their position before the law. The strong points in their defence are briefly stated in an article which recently appeared in the West Coast Lumberman as follows:—

"The Government admits that no attempt has been made by dealers to control prices or prevent competition. The indictment states that these secretaries have kept themselves informed as to those producers who tried to double cross them by selling direct to consumers. This is what is being done in the other great lines of trade. The merchant has a right to buy from whom and where he pleases. To urge that a merchant must buy from his competitor is ridiculous. The retail lumberman takes the position that the wholesaler, shipping in to a retail dealer's territory and selling direct, or one who sells to mail order houses, is acting unfairly and trying to destroy the retail lumberman's business. When a retailer finds a wholesaler selling direct to a consumer in his territory, the retailer certainly has a right to break off business relations with the wholesaler. This being granted, it follows that the retailer has a legal right through lawful means and agencies to secure information or to suspend business relations with any wholesaler. Indicted secretaries have not conspired to urge or direct retailers as to whom they should not buy from. Such advice would be unnecessary, for a retailer would not buy from a competitor.

"The decision of the Supreme Court of the United States in a case brought up from the State of Mississippi outlines plainly that a retailer can fix a rule as to buying his stock from a producer or wholesaler who sells to a consumer in competition with himself; no law which would curtail this freedom of action would stand.

"It is positively asserted that no member of any of these retail lumbermen's associations, acts under compulsion, but follows his own rule of conduct. If these associations are denied the right of securing and furnishing information, they are denied the right of free speech and free press.

"The question involved in this contest is one that appeals to the whole retail interests of the country.

"It is stated now that the Attorney-General of the United States intends to follow up the indictment of these secretaries and ask for the dissolution of the retail associations they represent. This order of dissolution will be requested, on the allegation that these organizations have maintained a Black List and in other ways acted in defiance of the anti-trust law."

The Lumberman's Interest in the Elections

The lumbermen of Canada have always taken a keen interest in the political welfare of the country. The present election is no exception in this regard, and a number of well-known lumbermen are to be found seeking election in each of the political parties. One might expect that with such an important question as reciprocity on the boards, this would be the case, as one of the most important matters in the proposed reciprocity proposal is the agreement on the part of the United States to remove the duty of $1.25 per thousand feet on rough lumber. The fact that the lumbermen of Canada are to be found on both sides of the question goes to show that within the industry itself there are those who conscientiously believe—some of them, that reciprocity will be harmful, and others, the reverse.

Whatever the outcome of the elections may be, so far as the duty on lumber is concerned, it is not unlikely that within the near future Canadian lumber will enter the United States free of duty. If the liberals come into power and the reciprocity measure is passed, the duty will be at once removed. If the conservatives win and reciprocity is defeated, the chances are that before long proposals for the removal of the duty on lumber entering the United States will be brought forward in the House of Representatives and pushed vigorously by those who have been so active, within the last few years, in urging a general tariff reduction. Free lumber, in fact, is one of the planks of a strong section in the House of Representatives, and it finds favor on both sides. Irrespective of the reciprocity situation, therefore, it looks as though free lumber were likely to be agreed to in the not distant future. The uncertainties of politics in the United States, however, would make it folly to expect this confidently. It may be that the cry for free lumber has been used as an election argument simply, and that before long it will be relegated to oblivion along with many other campaign cries.

The lumberman in Canada has several points to consider before he casts his vote. First of all is the simple economic situation provided by free lumber. It seems to be very generally agreed that under free lumber the manufacturers in Canada would benefit considerably so far as the returns from their operations are concerned. The United States' market, an attractive one even as it is, would be all the more accessible with the duty of $1.25 per thousand feet removed. The low grade lumber which so frequently stocks up at mill points when the demand for lumber is poor, would have an additional outlet in the United States, and this would make it more possible to avoid waste in lumbering operations. On the other hand there is the drain upon the forest resources of Canada to be considered, and the opponents of reciprocity claim that with free lumber our forest resources would be cut at a much greater rate than they have been in the past. It is pointed out that a great amount of the timber in British Columbia is owned by United States capitalists, and that they have been waiting anxiously for free lumber. With reciprocity, it is said, they would immediately commence to cut the timber of British Columbia at a dangerous rate, and ship it to the United States markets. This is a situation which might possibly be controlled by Provincial Governments, to a large extent, but it is a dangerous feature of the case, nevertheless.

The pulpwood situation has been outlined so widely by the press of the country that it is pretty generally understood. Briefly, the situation is, that most of the pulpwood producing provinces forbid the export of pulpwood in an unmanufactured state. The reciprocity proposals contain an agreement by the United States to admit Canadian pulp and paper of a value of four cents per pound and less, into that country, provided that there is no export prohibition or tax upon pulpwood from which it is made. This is to a large extent ineffective because of the Provincial prohibition upon the export of pulpwoods cut from Crown lands. But private land pulpwood can be exported, and therein lies what is considered a danger point, by the paper makers of Canada, who claim that the United States may, at any time they see fit, declare that the free export of private lands pulpwood justifies them in admitting Canadian pulp and paper free. If this were done Canada would also have to admit United States pulp and paper to a value of four cents a pound and less into this country, and it is asserted that Canadian paper mills could not stand the competition of United States mills with their much greater capacities and more modern equipments.

Taking it all round, therefore, the situation is one which presents many complicated considerations for the lumberman, and whatever the solution may be the development of the situation after the election will be fraught with the utmost importance to the lumber industry of Canada.

Proposed Changes in Red Cedar Shingle Grading

Much interest is being taken in the Western States and Canada in the proposed new grading rules for red cedar shingles. The suggestions were first made by Col. H. S. Stine, of Seattle, and since they were made have met with considerable approval from manufacturers wholesalers and retailers. For the interest of the readers of the Canada Lumberman and Woodworker we publish the suggested changes, as follows:—

Clears—16-inch. Variation of 1 inch over or under allowed in 10 per cent, but not reduced butts or shims. Random widths, but nothing narrower than 3 inches and not more than 5 per cent. narrower than 4 inches. When dry, 25 courses to measure not less than 9 inches. To be strictly clear, 90 per cent. vertical grain; free from sap and other defects, and well manufactured. Color of wood no defect.

Stars—16-inch. Variations of 1 inch over or under allowed in 10 per cent. Random widths, but not narrower than 3 inches and not exceeding 10 per cent. narrower than 4 inches. When dry, 25 courses to measure not less than 9 inches. Will admit sound tight knots up to 1½ inches in diameter and wormholes, if 10 inches and over from butts, and sound sap not in excess of ½ inch; clear shims 14 inches and over and reduced butts 15 inches and over in length and not less than ¼ inch thick, not exceeding 5 per cent., admitted; otherwise to be well manufactured. Color of wood no defect.

Choice—16-inch. Random widths, but not narrower than 2 inches and not exceeding 10 per cent. narrower than 3 inches. Admits all degrades from Clears and Stars 12 inches and over in length and not less than ¼ inch thick at the butts, with defects 6 inches and over from the butts, but no defect that will impair the strength throughout, nor wedge shapes that vary more than ½ inch.

Packing.—All shingles to be packed in the regulation 20-inch frame, with band-sticks not shorter than 19 inches. Bunches to be packed 25 courses at each end. All shingles to be bought and sold on the basis of a multiple or unit of four bunches, the four bunches to contain not less than 308 feet 4 inches line measure across the butts.

Dimension shingles, 5 inches wide. Shall be of either the Clear or Star grade; shall be packed 24 courses at each end of the bunch and bought and sold on the basis of a multiple or unit of four bunches.

Manufacture.—By well manufactured it is intended to imply that shingles must be approximately regular in thickness and evenly sawn; must be joined approximately parallel; to be free from stub-corners or corners that feather more than 1 inch, wedge jointing or reduced butt lengths or more than ¼ inch wane or shims.

In the rule for 16-inch Clears, Mr. Crull has eliminated what he calls reduced butts and has admitted five per cent. less than four inches in width. Whereas in the rules proposed by Mr. Stine no shingles narrower than four inches are admitted. In the rule for sixteen-inch Stars Mr. Stine admits random widths but not narrower than three inches. Mr. Crull would not admit to exceed ten per cent. narrower than four inches. In the rule for sixteen-inch Choice Mr. Stine admits random widths but not narrower than two inches, while Mr. Crull would not admit to exceed ten per cent. narrower than three inches. The other changes may be noted as printed in black face type and speak for themselves.

The problem of packing is one on which buyer and dealer have long disputed. The old rules and those proposed by Mr. Stine admit openings that will not average more than one and one-half inches to the course. In Mr. Crull's rules that is omitted and the substitute therefor is that "four bunches are to contain not less than 308 feet and four-inch line measure across the butts." While this may be a trifle more definite it makes no difference in the result as the average of one and one-half inches to the course would make the shingles for each one thousand equal to the definite measurement given by Mr. Crull. In this connection it is well to note what basis was originally taken for the measurement of a thousand shingles. It is the intention that the buyer and consumer expect one thousand shingles laid four inches to the weather to cover an area of one hundred square feet. Obviously it would require only a measurement of three hundred feet line measure across the butts to cover the required area and on this basis the shingle manufacturer is given eight feet and four inches or nearly three square feet more than the basis originally claimed.

As stated at the beginning it is the evident desire of both of the gentlemen who have been quoted to produce results that will be satisfactory to both seller and buyer and if any proposed set of rules is lacking in definiteness, it would undoubtedly be better to keep at them until there can be no question as to their exact meaning. It will not only aid the inspector who is sent to settle disputes, but will also so accurately determine what should be delivered under given trade names that a large percentage if not a large majority, of the disputes would be entirely eliminated.

Editorial Short Lengths for Busy Readers

The Forestry Service of Montana is doing a large amount of trail work in Lincoln County this year, and a number of good trails have been cut through stretches of heavy timber land. This work is of great benefit to the rangers in patrolling their districts and is also providing wagon roads for the ranchers in that vicinity.

At a joint session of coast and mountain sawmill men of British Columbia on Aug. 31st it was alleged that American competitors have taken advantage of the absence of the duty on rough lumber to send thousands of carloads of dressed lumber into the prairie markets without paying the duty as required by the Canadian customs tariff. Customs officers it was alleged overlooked proper classification of imported dressed lumber.

The depression in the lumber trade south of the international boundary has resulted in an invasion of the markets of the prairie provinces and British Columbia at prices estimated to be lower than the actual manufacturing costs. A strong committee entrusted with the task of devising ways and means to meet the extraordinary conditions which now prevail was appointed at the session and will report to a special meeting at an early date.

Discussing the grading proposals Mr. D. H. McLennan, of the McLennan Lumber Co., Ltd., Montreal, expressed his views to a representative of the Canada Lumberman as follows: I am of the opinion that this country badly needs established grades which should be in force from ocean to ocean so that when a manufacturer sells and a middleman or dealer buys they should do so on grade. To successfully establish this the grading should originate with the manufacturer and should be uniform all over the Dominion. As it is now every lumberman in the Ottawa district has a grade of his own and in other parts of the Dominion the same condition exists with the result of a great variation in grades. For instance: Eastern or New Brunswick fourth quality is practically the same as an Ottawa mill cull. If the Canadian Lumbermen's Association is going to do any practical good the members should take up this question of uniform grading for the whole of Canada.

Interesting statistical comparisons may be made from the 1910 lumber report prepared by the Dominion Forestry Department recently:—

Of the twenty-six species of wood which together were cut in 1910 to the extent of 4,900,000,000 board feet, worth over $77,000,000, the first nine were coniferous, or softwoods. Spruce formed over one-quarter of the total cut. Spruce and white pine together formed barely one-half of the 1910 cut, while in the year previous they made up nearly three-fifths of the total. The decrease is due to a very great increase in the amount of Douglas fir, hemlock, cedar and yellow pine produced in British Columbia. One-quarter of the 1909 cut was formed of these four species, while in 1910 the total cut of the four was increased by 70 per cent.

Up to three years ago, white pine stood at the top of the list in importance to the lumber industry, when it was supplanted by spruce, although the actual cut of the former had not decreased. The prediction of last year that white pine had nearly reached its maximum cut has proved true this year, the 1909 cut being decreased by four per cent., or forty-two million feet. Yellow pine increased in its cut nearly six hundred per cent. in British Columbia during one year.

In comparing the building operations in Toronto and Montreal, a correspondent states:—

Indirectly, lumbermen are interested in the progress of building in our cities, and any point which affects the value of the construction has a bearing on the industry. In looking over the permits issued in Montreal and Toronto for the past eight months it would appear that the latter city is making greater headway than Montreal. Thus the approximate value of the buildings in Toronto is put at $16,603,845, while in Montreal for the same period the value is estimated at $11,739,599. Now, Montreal is experiencing a building boom, and yet her figures are far below those of Toronto, where, building is not so active.

What, then, is the reason for the difference in the values. It is to be found in the fact that when permits are taken out in Montreal many proprietors, and in some instances, contractors and architects, under estimate the real value of the buildings to be erected. This is done in order to escape a portion of the registration fees, which are based on the cost of the proposed buildings. Naturally Montreal suffers when comparisons are made with cities where full values are given in the permits.

Probably if a stiff fine were imposed on a person convicted of making false entries it would make others who are in the habit of evading the by-law more careful.

Important Sawmills of the Georgian Bay

No. 5—Graves, Bigwood and Company's Efficient Plant at Byng Inlet —Production of Over 200,000 Feet Per Day—A Model Lumber Town

Graves, Bigwood & Company's Plant—General View of Plant.

Graves, Bigwood & Company's Plant—View Along One of the Trams.

BYNG Inlet, Ont., a pretty little town on the eastern shore of Georgian Bay, is one of the most interesting places in Canada that a lumberman can visit. The town is entirely built up around the plant of the well known lumber manufacturing firm, of Graves, Bigwood & Co., and is almost entirely dependent upon this company for its prosperity. There has been a sawmill in operation at Byng Inlet since the early eighties, Anson Page, Burton Bros., and the Georgian Bay Lumber Company, in addition to Graves, Bigwood & Co., have been interested at different times in lumber manufacturing plants at this point. Graves, Bigwood & Co. have been operating at Byng Inlet for 13 years, the firm consisting of L. P. Graves, W. E. Bigwood, A. C. Manhert, H. I. George, and N. Holland.

The plant of the company is generally acknowledged to be one of the most up-to-date and complete to be found anywhere in Canada. It includes 2 sawmills, and a box factory. The equipment of one of the mills consists of a twin band and 2 gang saws, and the equipment of the other consists of 2 band saws and a gang. All the band saws in the two mills are single cutting. The equipment includes in addition to the saws a very complete outfit of edgers, trimmers, etc. The lath mills run in conjunction with the sawmills are equipped with modern lath and picket machinery. A splendid dry kiln is operated with a capacity of 80,000 feet. It is built upon the Sturtevant system.

The equipment of the box factory consists of 12 saws, a complete set of planing machinery, matchers, ripsaws, siding saws, etc. The box factory and the planing mill are housed in one building, the former being in the upper storey and latter on the ground floor.

In the village of Byng Inlet the company own 106 houses which are rented to their workmen. They also conduct 4 large boarding houses for the accommodation of employees.

The output of the sawmills is from 200,000 to 250,000 feet per day, the product consisting principally of pine and a small amount of hemlock and spruce which is marketed both by car and water shipment.

A noticeable feature of the plant is the excellent system of elevated tramways, connecting the mills and yards. These tramways are considerably higher, larger, and stronger than the average sawmill tramway.

The mill of Graves, Bigwood & Company was the only large

Graves, Bigwood & Company's Plant—View of Yard.

Graves, Bigwood & Company's Plant—View of Plant from Railway.

mill on the Georgian Bay built previous to the time when the Ontario Government prohibited the export of saw logs from the province.

In addition to shipping to the United States and Canadian markets the company carries on also a continually increasing export business to England and to South America. The box factory at Byng Inlet supplies the Canadian trade exclusively, having been erected as a refuse proposition for the purpose of working up the slabs which were formerly consumed in the burner.

The illustrations accompanying this article will give a fair idea of the compact and businesslike appearance of the plant. One should visit the town of Byng Inlet however to obtain a proper idea of the importance of this company's operations and the splendid manner in which they are conducted.

The Lumbering Industry in Nova Scotia

Conditions in the Eastern Province To-Day—Export Market Large — Demand on the Increase

By J. B. Whitman.

To point out the condition of the Lumbering industry in Nova Scotia with reference to supply and demand, as it is to-day and predict with some degree of certainty what the probably condition will be as the years pass on is perhaps a rather difficult task. But if we look carefully over the matter we may be able to approximate what the future will be by the actual facts of the present.

According to the best information obtainable Nova Scotia is now exporting annually about 340 million feet of sawn lumber.

These figures are not absolutely correct but from careful compilation of best information to hand they are probably quite close to the mark. In addition to this there is about 85 millions used in domestic consumption. Correct figures have been obtained of the two counties of Annapolis and Shelbourne for the years 1909 and 1910 respectively. The actual production in the county of Annapolis in the year 1909 was a little more than 26 millions of sawn lumber, chiefly spruce, with a per centage of pine, and hemlock and about 4 millions of small stock such as barrel and box material and shingles, making a total production for the county in that year of a little more than 30 millions.

In the following year that is 1910, the county of Shelbourne produced 11 millions most of which could be termed sawn lumber.

This was made up of about 6½ millions of pine and 3 millions of hemlock and 1½ millions of spruce, fir and hardwood. In neither case do these figures include timber used in shipbuilding. These are the only counties for which the figures are accurately known and the amount for each represents about a normal cut.

Taking the figures for the Province as given viz: 340 millions for export and assuming that it represents about eighty per cent. of the whole production we have 425 millions as the total.

The next question that arises is "Can these figures be kept up? Can this production be maintained?" This is a difficult question and one that with our present knowledge of forestry is rather hard to answer. To put the question in another form, "Is this quantity greater or less than the annual increment of growth?"

Forests are an accumulation of growth, but if this accumulation of growth is being reduced then the forests are being depleted, and if being depleted, scarcity is coming, and if so when or how soon?

The only proper condition that should prevail in any country that has been long settled is to treat the forests so that the annual production will be the maximum quantity but cut and market no more than that quantity. Quite a number of timber owners in Nova Scotia are beginning to treat their lands in this way but they are chiefly holders of comparatively small areas.

Pine is certainly becoming scarcer in Nova Scotia and the sum total of hemlock is also being reduced. It is quite possible that spruce timber is growing as fast as it is being cut, but is it growing fast enough to make up for the reduction in the total amount of pine and hemlock? Fir is used for lumber to quite an extent especially in Cape Breton. It is a rapid grower and is holding its own very well, but when we consider that in the year 1910 the Dominion Coal Company used for underground work, exclusive of construction work, more than 19 million lineal feet of small timber and of which fir formed a good percentage we have to admit that notwithstanding fir is a rapid grower it must needs be so to supply this enormous demand.

Hardwood timber exists in Nova Scotia to a large extent but like hemlock it is a slow grower. It takes a long time to grow a hardwood or hemlock log. Pine, spruce and fir grow much more rapidly and are the best kinds to cultivate and care for to get the greatest quantity of wood with the least expense. Fire and wasteful methods of operating are two things to be guarded against. In a great many instances the method of operating has had a tendency to cause the annual growth to fall much below normal.

There are two distinct features of the timber supply, one is the annual amount of growth and the other is the accumulation of wood formed by the growth of previous years and the only safe way is to cut the growth and maintain the accumulation.

At the present time the large holders in their logging operations perhaps want to get a certain quantity and they get it irrespective of annual growth. Small operators cut timber if they have it, while others are as stated treating their areas in the best way by simply cutting the mature timber.

It is difficult to say at the present juncture whether the accumulation is becoming less or not, but it is very probable that such is the case.

On the other hand if we consider the demand, "Will it be greater or less in the future?"

The first consideration is the demand for domestic use and there is every reason to believe that this will become greater. High civilization alone without any increase of population means an increased demand, for the most highly civilized nations are the largest per capita users of wood. The fruit industry of Nova Scotia is developing rapidly which means that more wood is required for boxes and barrels. The vast coal areas can not be successfully worked without the use of immense quantities of wood and timber, also people are becoming more wealthy and are building larger and better houses. It is true that as wood becomes higher in price other materials are likely to be used as a substitute for it. The use of paper for writing, for newspapers and books has increased enormously and is still increasing and while the paper is made from wood pulp it means increased demand of the forests. It has been stated that steel can be manufactured in such a way as to be printed on and made into books but even if this is done it will not change the situation very much, for to manufacture the steel requires more coal and to mine the coal requires an increased use of wood.

In predicting the future it would seem that in about every line of domestic repuirement into which the use of wood enters the demand in the future will probably be greater than it is now.

The bulk of the lumber exported goes to England, United States, West Indies, South America and Madeira Islands. A careful view of the situation in each of these places will establish the fact that demand is bound to increase. England has very little timber and must import a very large part of what she requires. Most of what goes there from Nova Scotia is in the shape of deals. Some of these deals are resawed there and come back here again in the form of boxes filled with goods of various kinds. There ought to be a good chance to develop this trade by having the material sawed dimension on this side instead of shipping the deals and having them resawed there. There can be no possible question of the decline of this market while England continues to occupy a high commercial position. She must have the material and outside of the other provinces of Canada there are not many competitors on this side of the water.

The United States market is a pretty safe proposition for Canadian lumbermen and especially Nova Scotians. The fact that they have reduced their timber areas to a large extent is pretty well established. Of course the National Government has begun a good system of practical forestry but it will be some time before the results of their policy in that direction will amount to enough to affect in the slightest degree either the price or the demand. They can if they choose impose a heavy duty on foreign lumber but the chances of them doing so would seem to be rather remote.

With regard to West India market the demand will always exist but will be more or less dependent on the general prosperity. As trade between Canada and the Islands is quite sure to expand due to Canada's rapid growth and consequent larger consumption of tropical products grown there it must mean increased demand for Canadian lumber and Nova Scotia being so situated geographically as to be able to cater to that trade will be sure to get a good portion of it. The failure of crops causing local depression might cause a decline in demand but this would only be temporary.

With respect to the South American market unless some substitute is found there will continue to be a good demand for Nova Scotia lumber. Prices may fluctuate and trade conditions may change but the demand will continue. The quantity used in the ranching business is likely to increase. As ranching has fallen off in the Western States due to the division of the land into farms so is it likely to increase in some of the districts of Argentine.

The Madeira Islands will continue to require more or less lumber and while the demand may vary according as business prosperity or financial depression may exist, it is bound to continue to a greater or less extent unless some substitute is discovered that will replace wood both for building and other lines of use. This is not probable unless a very decided advance in prices should occur. There seem to be strong indications that prices will advance but the advance should not be sufficient for some time at least to cause consumers to spend much time in looking for a substitute. There are some uses to which wood is put now that other material might answer the purpose for, but so far as we can see most any operation requires a large consumption of wood. If the use of wood is eliminated as a principal factor the accessory conditions require more or less. For instance the mining of coal can not be done without the use of a vast quantity of timber, cement houses cannot be built without using a comparatively large quantity of wood and timber, even steel shingles require the use of timber for staging. Ships may be built of steel but it means the use of a large quantity of wood.

At present the prospects of some substitute for lumber being discovered that will really take its place and affect the price are indeed remote, and it is only probable that a great effort will be directed along this line when the price has become high enough to make such an effort desirable or necessary.

The general view of the whole situation is that we are face to face with an increasing demand and a diminishing supply. It is not pronounced enough yet to cause apprehension but it is undoubtedly the fact.

The other provinces of Canada can take care of a large proportion of the world market at present but looking at the matter from a Nova Scotia standpoint it would seem that the export market for lumber is a satisfactory one and is extremely large, also geographically speaking it is easy of access and furthermore the demand is increasing.

We are not absolutely sure that our supply is diminishing but such is the probability. However if we begin even now (some have already begun) to care for our timber and maintain our reserve or present accumulation, we have and will continue to have a very valuable asset in our lumbering industry.

What might appear at first sight to be two disturbing influences in the lumber industry are the completion of the Panama canal and the possible opening up and exploitation of the eastern slopes of the Andes Mountains. The completion of the Panama canal may mean the placing of some of the Pacific coast lumber in the markets on the shores of the Atlantic, but freight tolls and a long carry will prevent keen competition with the Nova Scotia product. There are many difficulties in the way of carrying on lumbering operations on the Eastern slopes of the Andes Mountains. Reports that seem to be authentic, state there is timber in that locality but if even this is the case the obstacles in the way of operating are gigantic and the expense accordingly.

However men are constantly reaching out into the dark and unexplored portions of both the scientific and physical world and what may appear now to be unsurmountable difficulties might melt away but Nova Scotia lumbermen need have no fear of competition from that quarter for some time to come.

Plant of the Bathurst Lumber Company

Description of New Brunswick Mill and Equipment—Large Daily Output—Five Hundred Men in Camps

The little village of Bathurst, situated on the shores of the inner Bathurst harbor, now claims to have the most modern mill in the Maritime Provinces at the present time.

In 1907 the Bathurst Lumber Company first began operations, having acquired the properties of the Sumner Lumber Company. Under the new control the old mill was in operation for nearly a year, until it was completely wiped out by fire on the night of March 31, 1908. The unfortunate occurrence resulted in a decision of the management to build along the most up-to-date lines. In less than ten months from the date of the fire there arose over the old site, what is not only a thoroughly modern plant in every way, but also one that is absolutely fireproof.

Bathurst Lumber Company, N. B.—View of Mill from Boom.

Bathurst Lumber Company, N. B.—Sorting Tables and Trucks.

The entire structure is of reinforced concrete and sheet metal and consists of the mill building, engine and boiler rooms, the installment of which presents a rather unusual innovation. The boilers are set in steel casings, lined with brick, and are raised 7 feet above the floor by means of steel posts set upon concrete foundations.

The engine room contains a 100 h.p. Robb-Armstrong engine, and an electric generator, supplied by the Canadian General Electric Company, of Toronto, and used for lighting purposes only.

The mill building is built upon concrete foundations, the first floor being supported by concrete pillars two feet square, set upon rock foundation. The machinery on this floor is all driven from below, a surprisingly small number of belts being in evidence, which not only minimizes the likelihood of accidents, but also allows greater freedom for working. The heavy machines are placed upon concrete bases. Their number includes two 8-inch band saws, one vertical resaw, one horizontal resaw, two edgers and several smaller machines answering various purposes. The walls and roof are of sheet metal, the latter being supported by structural steel raftings. Above the mill floor the band saw filing room is situated. Here all the filing is done by an automatic machine-driven emery wheel. An excellent sawdust and waste carrier system has been installed, the waste being carried over a hundred yards to the burner, which is situated right at the water's edge.

Bathurst Lumber Company, N. B.—General View of Plant.

The mill itself is ideally situated on the inner harbor and has facilities for loading by either rail or water, possessing a siding of its own for the former. At the present time the government is dredging a 25-foot channel to provide access into the inner harbor for the largest vessels to load. The yards extend for over a mile along the water front, and are so laid out that in case of fire, the company's fire tug would have no difficulty in reaching any part of them. Besides the mill the company owns and operates its own general store at this point, from whence the lumber camps are also supplied. Last season this company operated their own lumber camps along the Netisiquit and Tetegouche rivers, having over 500 men in the woods. Their limits extend over 400 square miles along these rivers and no rafting is necessary, as they can float their logs right to the mill boom. Up to the present time, spruce, pine and cedar have been the most cut, but the company now expects to take out hardwood to a considerable extent, as they will soon have a line of railway running into their limits.

Bathurst Lumber Company, N. B.—Showing Facilities for Barge Loading.

The output of the new mill has averaged from 125,000 to 150,000 feet per day, while they have run as high as 175,000 feet in a day. This lumber has its market chiefly in England and America, while a large volume of trade is also transacted with South America and Cuba.

One point that has been omitted in the description of the plant is the adequate stabling which the company has established for upwards of two hundred horses.

The officials of the company are as follows: President, Hon. Wm. C. Edwards; general manager, Mr. Angus McLean, of the Hugh McLean Lumber Company, Tonowanda, N.Y.; while Mr. A. E. Loosen is local manager. It is Mr. Loosen's intention to build up a town in the vicinity of the mill, which will be owned by the company. In this regard he has already made rapid progress, as quite a number of dwelling houses have already been constructed and are owned by the progressive company.

The Harvest of Hickory

The Office of Wood Utilization of the Forest Service, U. S. Department of Agriculture, is co-operating with the National Hickory Association in a comprehensive investigation of the country's hickory problem. The annual cut of more than 300 million feet, exclusive of fuel, is well known, but it is not so well known what becomes of it. The country's hickory supply is limited—it probably does not exceed 10 billion feet. This is really the world's supply, because the wood grows only in that country. Thirty-four states contribute, but two-thirds of the supply comes from half-a-dozen. It is one of the most important woods of that or any other country, and for a number of purposes no satisfactory substitute has been found for it.

It is a wood so valuable for special uses that it ought not to take the place of common lumber. While it is not believed that a very large quantity is so used, yet there are no statistics showing where all the 200 million feet cut by ordinary sawmills goes. It ought to go to handle mills, carriage shops, and factories that demand it for special and exacting purposes, but it is not known that it all goes there. In fact, it is known that some—probably not much—makes crossties, fence posts, bridge plank, and other farm timbers.

The investigation will look into the use of hickory as fuel. It is one of the very best woods for that, but logs fit for buggy rims, axe handles, or sucker rods, should not go to the woodpile. The hickory lumbermen should have first choice, and the firewood cutter ought to be satisfied with what is left. It is interesting to note that meat packers in many of the cities, and smaller towns as well, prefer hickory to all other woods for smoking meat, and large quantities are so used. This matter will be included in the investigation, and the demands of packers for smokewood will be considered.

It has been asserted that the waste of hickory in the woods and at the mills is unnecessarily large, but the assertion has been strongly denied. A thorough investigation of this phase of the question is under way, and it will be carried out by field work in four typical hickory states, Missouri, Mississippi, Louisiana, and North Carolina, and by correspondence in 12 other states.

June Cut and Shipments of Northern Pine Mills

Northern pine mills have reported their production and shipments for June to Secretary H. S. Childs, of the Northern Pine Manufacturers' Association, and he has compiled the returns for the first six months of the year, compared with the same months of last year, as follows:

Monthly Production of 1910 and 1911 Compared

Month—	1910 Lumber	1911 Lumber	Difference Feet	1910 Lath	1911 Lath
January	35,184,679	68,312,036	*33,127,357	8,053,845	23,487.925
February	26,651,618	63,337,573	*36,685,955	7,613,400	16,506,025
March	37,600,396	62,598,969	*24,998,573	8,344,600	17,300,200
April	109,883,436	109,722,132	†161,304	26,229,000	30,987.790
May	147,385,104	153,185,840	*5,800,736	29,898,095	41,880,288
June	176,796,313	190,043,696	*13,247,383	46,217,425	49,449,245
Totals	533,501,546	547,200,246	*13,698,700	123,356,365	179,611,453

Monthly Shipments of 1910 and 1911 Compared

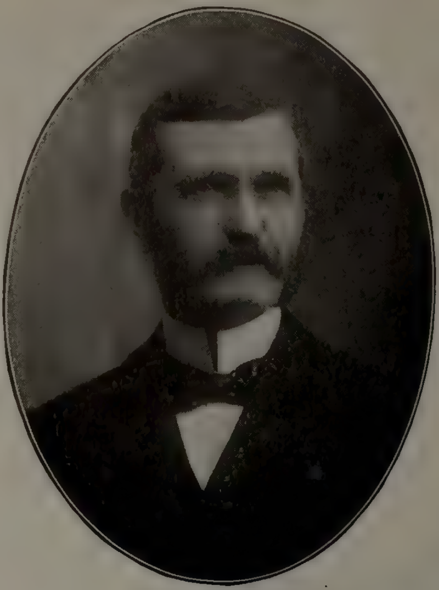
*Increase. †Decrease.

E. W. Tobin—Bromptonville
(Candidate in Richmond and Wolfe.)



Wm. Power—Quebec
(Candidate in Quebec West.)

Geo. H. Perley—Ottawa
(Candidate in Argenteuil.)

Lumbermen for Dominion Parliament

List of Candidates Includes Numerous Lumber Kings —Men of Wide Experience to Represent the Industry

An examination of the list of candidates who have been nominated throughout Ontario and Quebec for the coming election of Sept. 21st, shows quite a number of our lumber merchants and manufacturers to be included. Brief sketch of a few of these are given below.

Mr. Wm. Power, member of the firm of W. &. J. Sharples, lumber merchants of Quebec, was born at Sillery, Que., in 1849, and has been connected with the Sharples firm since 1860. Mr. Power owns large timber lands in the east and Maritime Provinces, and is one of the principal owners of the River Ouelle Pulp & Lumber Company. He is an ex-president of the Board of Trade and has for the past ten years been school commissioner for the city of Quebec. Mr. Power's parliamentary career extends from 1902 when he was returned by acclamation to the House of Commons for Quebec West, and was re-elected again in 1904, but was unsuccessful in the 1908 general election. Mr. Power's comprehensive knowledge and experience in the lumber industry of Canada suits him well for representing this branch in the Dominion Parliament.

In Quebec City Mr. William Price, of Price Bros., is a power to be reckoned with. Politically he is a strong force and commercially no one occupies a higher position. His business interests were no doubt a prominent factor in securing his election for Quebec west in 1908 by a majority of ten, thus transferring the seat from the Liberal to the Conservatice column. Born at Talco, Chili, in 1867 Mr. Price came to Canada in 1878 and in a very short time made a name for himself in business circles. He is now Vice President of numerous corporations, but his greatest interests are in the lumber trade.

At the last election Mr. Edmund William Tobin had a majority of 839, so that his opponent at the coming election in Richmond and Wolfe County would seem to have a formidable task, particularly as Mr. Tobin proved successful in the 1900, 1904 and 1908 contests. Mr. Tobin was born at Brompton Falls, Que, in September, 1885, and is the son of Patrick Tobin. He has taken a prominent part in local affairs, having been Mayor of Brompton Falls and also Warden of Richmond county. Besides being interested in the lumber trade, he carries on business as a general merchant.

There is no more stenuous fighter on the Conservative side than

A. B. Hunt—Robinson, Que.
(Candidate in Compton.)

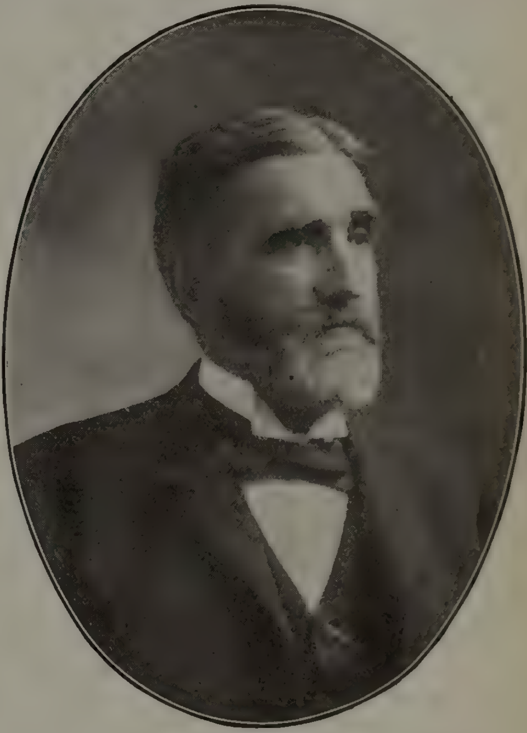
Manley Chew—Midland, Ont.
(Candidate in E. Simcoe.)

Gerald V. White—Pembroke, Ont.
(Candidate in North Renfrew.)

Mr. G. Haley Perley, B.A., the party's whip. Mr. Perley is a very forcible speaker. Born in Lebanon, N. H., in 1857, he was educated at Ottawa Grammar School, St. Paul's School, Concord, N. H., and Harvard University. His family have been for many years associated with the lumber business, his father being one of the largest operators on the Ottawa. Formerly the firm was known as Perley & Pattee, of which his father was the senior partner, but it has been changed to C. H. Perley Co. Mr. Perley is also vice-president of the Hull Lumber Company., a director of the Bank of Ottawa, and is also connected with other commercial undertakings. He is Vice President of the Rideau Club and the Ottawa Golf Club. He has done a great deal for Ottawa, and along with the other heirs of his father donated a beautiful home in that city as a hospital for incurables, which is now known as the Perley Home. On the occasion of the great Ottawa and Hull fire he was made chairman of the relief fund by which a million dollars was distributed to the sufferers of the disaster of 1900. His political career has been by no means a smooth one, for he was defeated for the House of Commons in Russell in 1900 and was also unsuccessful in a by-election in Argenteuil, Que., in 1902. In 1904, however, he was victorious in the latter constituency, which re-elected him in 1908 with a majority of 259.

Geo. Gordon—Cache Bay, Ont.
(Candidate in Nipissing.)

Wm. Price—Quebec, P. Q.
(Candidate for Quebec West.)



Hon. W. A. Charlton—Toronto, Ont.
(Candidate in Norfolk County.)

Mr. Geo. Gordon, president and general manager of the Geo. Gordon & Co., Ltd., Cache Bay, Ont., will again be a candidate in Nipissing district. In lumber circles Mr. Gordon occupies high and responsible positions, being also director of the Temagami Lumber Co., Ltd., Cache Bay Lumber Co., Ltd., Strong Lumber Co., Ltd., A. J. Young Co., Ltd., and the Lovering Lumber Co. Born in 1865 at Packenham, Ont., and educated in the province, Mr. Gordon has always been in close touch with provincial affairs, and his interests in the lumber trade, especially, are too well known to be reviewed in these columns.

In the Dominion election contest of 1904 Mr. Gordon was selected as the standard bearer for the Conservative party in Nipissing, but met with defeat. In 1908, however, Mr. Gordon was successful in being returned to Parliament, defeating his opponent in a spirited contest.

Mr. Thomas Manly Chew, who will again as a Liberal enter the contest representing Simcoe East, was born in August, 1874, at Rugby, Simcoe county. He is one of the best known lumber manufacturers in the Georgian Bay district. He first started business for himself about 15 years ago in Midland, and has since that date taken a deep interest in lumbering affairs, being a partner in the firm of Messrs. Chew Bros., and holding interests in several other companies, both in Ontario and British Columbia. Mr. Chew was a member of the Midland town council for a term, and later went to Parliament in the year 1908 as a Liberal candidate, where he has asserted at various times his opinions as to the welfare of the industry in which he continued to take such a live interest. Mr. Chew has had a splendid training in both political and professional affairs and is well equipped in this regard for the labor which a term in Parliament involves.

Mr. Malcolm Smith Schell, who is the contending Liberal candidate in South Oxford riding, Ontario, was born in that county in 1865. After a thorough education including a course in Woodstock college, Mr. Schell followed the respective callings of agriculturist, manufacturer and wholesale lumber dealer. He was first elected to the House of Commons in 1904 and again in 1908, and has taken at all times a prominent part in matters pertaining to agriculture and lumbering interests, and in the marketing of Canadian products. In 1909 Mr. Schell was appointed chairman of the Standing Committee on agriculture and colonization of the House of Commons.

In Norfolk county Mr. Alex. McCall, M.P., will again run as Conservative candidate and attempt to repeat his previous success in 1908. Mr. McCall was born in 1841 in Charlotteville, Ont., and has of late years taken an extensive interest in lumber and timber conditions.

Mr. Aylmer Byron Hunt, M.P., who is also a candidate in the coming election, entered the Federal House in 1904, and was again successful in the bye-election of 1905, and in the general election of 1908. Mr. Hunt was born at Bury, Que., in 1864. He has since followed the profession of carriage making, and has also dealt considerably in lumber. He has taken a large interest in the lumber trade and in timber lands during his career, and has done much to further the lumber industry in his parliamentary affairs.

Among others who are contending, and of whom we have been unable to obtain sketches in time for publication in this issue, are the following: Mr. F. M. McCrea, president of the Sherbrooke Lumber Co., who is the Liberal candidate for Sherbrooke, Que.; Mr. W. A. Charlton, who as a Liberal will contend Mr. Alex. McCall in Norfolk county, and who is a past president of the Lumbermen's Association of Ontario; Mr. Jas. Monro, the Liberal candidate in North Renfrew, who is also a prominent lumberman; F. W. Harrison, Owen Sound, is running against Mr. Middlebro in North Grey, Ont.; Mr. Jno. L. Regan, of Blind River, also a Liberal candidate, will oppose Mr. W. R. Smyth of East Algoma.

Mr. Wm. Ross Smyth, who represented East Algoma in the last Parliament, is a well known merchant and lumberman, and has been for many years a resident of the northern district, which he has represented in the Federal House of Commons for four years. Mr. Smyth is a native of Scotland, having been born in Thomroan, Aberdeenshire, in 1857. He was first elected to the Ontario Legislature in 1902 and again in 1905 and 1908, in which year he resigned and was elected to the House of Commons. Mr. Smyth has the lumber industry strongly at heart and is a hard fighter and does not hesitate to voice with vigor the needs of the great northern district.

Lumber and Its Interests at C. N. E.

Products and Accessories of Sawmills Exhibited in Great Variety — Machinery and Equipment Well Represented

The 33rd annual of the Canadian National Exhibition, held in Toronto recently, was a record breaking event as the travelers for lumbering concerns, who spent a week in the city at that time, will be able to tell. Quite a number of them availed themselves of the rare opportunity, and their frequent appearance in Machinery Hall and Process Buildings explained their absence from the road. A systematic investigation of the many manufactured products revealed a considerable increase in the exhibits of interest to lumbermen. Some of them were at a disadvantage owing to lack of space, and inferior position, but, generally speaking, manufacturers of lumber mill and camp equipment were away the more fortunate. A few of the many exhibitors deserving of recognition as those who were fortunate enough to behold, will remember, are mentioned below.

Cowan & Co., Galt, Ont., manufacturers of woodworking machinery, had a good display of their mortisers and moulders. Their chain saw mortiser M236 was shown in operation, as was also their moulder M132, matching various grades of lumber. Several other machines were also included in the exhibit, among which might be mentioned their hollow chisel mortiser.

The Dominion Belting Co., Hamilton, displayed an interesting exhibit of Maple Leaf stitched cotton duck belting and other products.

The D. K. McLaren Co., Ltd., Montreal, had an attractive exhibit of leather and waterproof belting, together with Phillips Bros. pressed steel pulleys.

The Canadian Metal Co. had a display of their various metals, including stereotype and linotype metals, babbitt metal, solder, block tin, copper, brass and aluminum castings.

The Positive Clutch & Pulley Works, Ltd., Toronto, showed to advantage their combined jaw and friction clutches and pulleys, and also their ideal wood-rim, steel-centre pulleys. The exhibit included a number of improved power transmission appliances.

The Canadian Steam Pump Machinery Co., exhibiting a comprehensive line of boiler feed and vacuum pumps for vacuum heating systems, and a number of other steam appliances.

J. L. Morrison & Co., representing the Advance Machinery Co., of Toledo, Ohio, had an interesting exhibit of wood appliances. They are also agents for Bertrams, Ltd., Edinborough, and had a display of their paper-making machinery.

The Cling-Surface Co., Buffalo, N. Y., demonstrated efficiently the use of their product upon leather and cotton belts and ropes, running their various degrees of slackness, without slipping or running off.

The G. Walter Green Co., Ltd., Peterborough, Ont., had a large assortment of saw and lath machinery, which included a number of them in operation.

Jones & Glassco, Montreal, had a comprehensive exhibit of various types of Renold silent chain and other transmission gears. The display included a rotoscope filled with Renold chain, 1-in. pitch, 2½ in. wide, driving from a pinion to a wheel where special provision has been made for minute examination of the chain in mesh. A variable speed motor is used making it possible for the chain speed to be varied from 700 f.p.m. to 2,000 f.p.m. They had also in operation a centrifugal machine as manufactured by Watson Laidlaw & Co., of Glasgow, and patent cotton driving rope for both of which they are the Canadian agents.

The Canadian Linderman Co., Ltd., Woodstock, had a splendid exhibit of their automatic dove-tail glue jointer and matcher, together with examples of its product with joints so indeterminable as to baffle the most observant.

The Canadian H. W. Johns-Manville Co., Toronto, exhibited their asbestos, magnesia and electrical products for pipe covering, packing, roofing, etc., including their steam packings, fireproof cements and linings, "Vulcabeston" and non-conducting materials.

The Canadian Hart Wheel Co., of Hamilton, Ont., had an extensive exhibit of grinding machines for planer knives, draw cutters, etc., as well as a wide assortment of emery wheels, oil stones, etc.

The General Supply Co. of Canada, Ltd., Toronto, showed a well arranged and comprehensive display for the London Machine Tool Co., and the Smart Turner Co., of Hamilton, the exhibit including pumps, machinery and supplies of interest to saw, lath and shingle mill owners and superintendents.

The Canadian Mathews Gravity Carrier Co., Toronto, had an interesting demonstration of their carriers, elevators, spirals and chutes, in operation upon shingle bunches, and boards of various sizes.

F. Sturgeon, Toronto, Dominion agent for Major & Co., Hull, Eng., had a display of "Solignum," and other wood preserving stains.

Henry Disston & Sons, Philadelphia, showed a comprehensive display of saws, files and tools, of Keystone brand.

The Carborundum Co., of Niagara Falls, Ont., displayed a number of their grinding machines, and an excellent assortment of their abrasives and stones, including also, emery, carborundum and garnet cloths and paper.

The James Morrison Brass Manufacturing Co. had a good exhibit of gauges, injectors and various other appliances for power house equipment.

Batts, Limited, West Toronto, manufacturers of high grade wood products, including veneered doors, newel posts, staved columns, flooring, sash, door and window frames, turned newels and balusters, etc., had a most artistic and comprehensive exhibit of their various lines of manufacture.

Shurley-Dietrich Co., Galt, Ont., manufacturers of "Maple Leaf hand and cross-cut saws had a very unique display of their high quality Canadian products, which created great interest.

The Borden Canadian Co., Toronto, showed an attractive exhibit of Beaver type of cutting tools and machinery, including narrow receding dies with universal chuck and detachable barrel. The exhibit also includes the Warren non-receding and wide chaser type tapered dies.

Baines & Peckover, Toronto, exhibited among other products, steel wire rope and cable manufactured by Thos. and Wm. Smith & Co. Their display also included "Atlas" babbitt metal, Balata belting and a number of machine shape and power house appliances.

Goldie & McCulloch Co., Galt, noted for their boilers, engines, etc., confined their display to a line of fireproof safes, vaults, and vault doors.

The Dominion Register Company, Limited, Toronto, had a fine exhibit of their well-known McCaskey account systems, which are proving so popular among lumber dealers.

The Crescent Oil Company's exhibit was in charge of A. D. McMillan. They showed a full line of valves, pulleys, belting and engineers' specialties, as well as two different lines of oils. The company's headquarters are in Hamilton, Ont.

The exhibit of the Talman Brass & Metal Company, Limited, of Hamilton, created great interest. Besides their "Archie" brand babbitt metal were lines of brass castings, finished brass work, brass tuling and brass rods.

Dominion Roofing Company, of Canada, Limited, Toronto.—Malthite and Galvanite roofing materials, the former a wool felt saturated and coated with natural asphalt, the latter a heavy wool felt base, triple coated on both sides with asphalt and finished with a heavy coating of flaked mica.

The Metis Lumber Company, Limited, of Price, Que., are the first lumber concern who have ever exhibited at the Canadian National Exhibition. Their exhibit of white cedar shingles was viewed by thousands with great interest. The exhibit was put up in widths of 8, 12, 16 and 20 inches, to show the size of the timber from which they were cut, and can certainly compare favorably with the British Columbia shingles. The Metis Lumber Company are entering the Ontario market with their shingles, with W. J. Smith, of Weston, the well-known wholesale lumber dealer, as their representative.

The Sawyer Massey Company, of Hamilton, confined themselves to their well-known implement lines. They manufacture, however, portable sawmills, and are putting on the market this fall an improved model which should prove very popular.

The Commercial Oil Company, Limited, of Hamilton, showed a full line of their different brands of oils which were greatly appreciated by the trade.

H. W. Petrie, Limited, Toronto, had one of the largest exhibits on the grounds. Besides other lines of machinery much interest was displayed in the exhibit of machine tools, woodworking machinery and supplies.

Garloch Packing Company, Limited, of Hamilton, specialists in engine packings, had a very fine exhibit of steam, water, ammonia and gas packing.

The Retail Dealer and His Problems

Handling Retail Stocks—An All Round Yard Man

Better Methods of Handling Stock

At the recent meeting of the Montana Retail Lumbermen's Association, H. A. Templeton spoke as follows upon "Better Methods of Handling Stock to Keep Down Investments:"

This paper has been prepared from the viewpoint of one who is in business for profit; to which class it is assumed we all belong. If there be among us a man who admires more than profit, fine large piles and extensive sheds well filled with good grades of lumber, and one who is willing to pay for the gratification of his whim, this is not for him.

Whenever the investment in business pays us less or even as little as the current interest rate on farm mortages we will get out of business.

We all know that the margin between buying price and selling price has been on the decrease in the past several years. The volume of business done per yard has certainly decreased, owing to the largely increased number of yards and the consequent cutting up of former territories. These two forces have acted concertedly toward reduction of net returns on investment, and for many of us the effect has been very nearly disastrous.

Therefore, the method by which we are to maintain the proper ratio between investment and net profit is of the greatest importance.

Probably the first thing to be done is the installation of modern and economical methods—a reduction in operating expenses. The next thing is to reduce the investment to a point where the yearly profit possible will be a reasonable return on that investment.

We younger men listen with mouths open to the reminiscences of you who sold lumber in Montana fifteen or twenty years ago. You tell us of the days when there was one yard in a town of a thousand to five thousand people, with a territory of fifty to one hundred miles in radius, and sales ran up to what now seems fabulous amounts.

To-day these same towns have three to five yards each, with a territory having a radius of possibly ten to fifteen miles. The sales and net profit you tell us are possibly one-quarter what they were in the old days. But the investment? Just as large as it ever was, and possibly larger. Successful continuation of a business in this plight certainly demands a reduction of investment in the same ratio as the sales and net profits have been reduced. It makes the difference between a good business and a poor one—success and failure.

For example: A and B each own a yard in a town of five hundred to a thousand people, where there is forty to fifty thousand dollars of business annually. Both are business getters and aggressive, with the result that the business is about equally divided. The margin of profit is approximately the same, and consequently the end of the year finds each with about the same amount of net profit, say a thousand dollars.

Certainly, one would suggest, there is very little to choose between these two men and the condition of their businesses. But, whereas A has a total investment in stock, real estate, buildings and outstanding accounts of ten thousand dollars, B's total investment foots up to twenty thousand dollars.

With this added information it is easy enough to choose between the two yards. A makes ten per cent. on his investment; B makes five per cent. on his. A's business is prosperous and successful; B's business could not be called good, according to any definition.

There is only one thing for B to do, and that is to reduce his investment to ten thousand dollars, and only when he has done this will his business be profitable and will he be able to meet his competitor on even ground.

I would say that a reduction of outstanding accounts and a shortening of the terms of sales is the first step to be taken. A reduction of stock is the second, and with that reduction this paper is to deal especially.

We all know the difficulty of selling something we haven't got, and agree that it is absolutely essential to have what the customer needs when he needs it. It is largely in our power, however, to educate our trade as to what items of lumber they need and use.

Pardon reference to personal interests, but to illustrate: Some time ago we established a yard in a new town out in the homestead country. The business in sight was not large and we could not see justification for a large investment. Our stock was bought accordingly, and was made up of the regular items of dimension, ten to twenty feet long; twelve inch number three boards; mixed widths number three boards; mixed widths number four boards; eight inch number two shiplap; six inch number two pine flooring; four inch vertical grain fir flooring; six inch number two drop siding; a small amount of C. finish of each width; Extra Star A Star shingles; two sizes of two-light windows; two sizes of four-light windows; some stock doors; threaded felt; thirty-pound building paper; two-ply roofing, and only a few other items of regular stock.

Our customers came in for their little shack and barn bills, and were supplied from this stock to their entire satisfaction. They never thought of or mentioned number two shiplap, or number three shiplap; four-inch pine flooring or six-inch pine flooring; Extra Star A Star shingles, or Standard shingles one-ply roofing or three-ply roofing.

Shiplap was shiplap, pine flooring was pine flooring, shingles were shingles, and so on down the line.

A year later a competitor came in. Not a bad, mean competitor, but a good one, a nice fellow and a good lumberman. He went right at it, though, to get in a "complete stock," as his ads read. Before long he had number one drop siding, number two drop siding, number three drop siding, four-inch flooring and six-inch flooring, number two shiplap and number three shiplap. Red cedar bevel siding and pine bevel siding.

Our yard looked like a vanishing shadow compared to his. The trade began to specify grade and call for long lengths. We simply had to come to it. They wanted three-ply roofing and half-ply roofing, as well as all weights between, and were ever fearful at that lest they should not be given the grades and weights wanted, since they had found out there were such differences.

To make a long story short, our investment doubled at that point inside of six months; and did our volume of business or the net profits increase? Not a cent. Was our trade better cared for or better satisfied? Not a bit of it.

This incident was one in the experience of a very small yard, I know, but the same experience also comes to the large yards in the large towns. Why introduce Southern yellow pine to a trade already educated to and satisfied with fir and Montana larch finish? Why duplicate a stock of cedar with California redwood? Why carry every weight of red rosin paper on the list, and some special weights besides?

You can't give your trade any more for their money by so doing. You can't gain a reputation for having a more complete stock than your competitor, for he will add these items as rapidly as you do in self defence. So I say the first thing is to educate your trade to a stock which the business will justify. Do not try to carry every item found on the list. If you already have your stock duplicated in all kinds of woods available and all weights of paper and roofing, start right in and cut some of them out. It is a hard job, but it can be done. A man does not have to injure his conscience to argue convincingly with a customer that a Standard shingle is not as good a buy for the money as the Stars. You know as well as I do that fir flooring is as good as yellow pine. Educate your trade to that point of view and cut out the slivery stuff from the southland.

No man ought to use twenty pound red rosin paper. It is no good. Then don't carry it. Half ply roofing is but little better than tar felt. Then don't do your trade the injustice of tempting them with it. Two-ply or tar felt is better for the customer and better for you.

Then as to the quantity of each item necessary. A customer wanting a thousand feet of boards is as well satisfied to take them from a pile containing four thousand feet as from one containing ten thousand feet. The only problem is to keep from reaching the bottom. Try always to have some left, for it is disastrous to any business to be forever out of stock.

To one who has never made a special effort in that direction, however, it is surprising to know how small an amount of stock will serve the purpose, if it is carefully watched and studied with a view to having future needs constantly provided for by ordinary mixed cars made up of small amounts of many items. Two by fours should be ordered in lots of one hundred each, instead of thousands. Sheeting in lots of five thousand feet instead of carloads.

Make it a point to keep all of each item of stock in one place. Do not scatter your six inch, sixteen foot flooring all over the shed in three or four different piles. Some day you will forget where one pile is, think you are out and order a lot more which is not needed. Always keep copies of orders filed in an orderly way. Look them over carefully when placing further specifications, and be sure you are not duplicating some item. To paraphrase Patrick Henry, "Eternal vigilence is the price of doing business with a small stock."

For line yard companies or others where the buyer is not right on the ground and familiar with the yard day by day, a piece stock sheet record is all but essential. Such a record when properly kept shows exactly how many pieces of two-inch dimension of each size and length is in the yard, and how many feet of each item of boards and products.

Never buy anything which you do not need, or stuff which is not regular stock in your yard, simply because it is cheap. It may look like easy money, but the tail-end left over from an odd lot will eat up the profit, as well as clutter up your yard; or if all the lot is sold some of your customers will have taken a fancy to it and will demand more after the special lot is gone. There you are—either add it as a regular item of stock or have a dissatisfied customer.

But in spite of every precaution the time frequently comes when a yard is long on one or two items of stock and short on others. It is then that the art of salesmanship is called into action. Not a man should come to the yard and get away without being tried out as a prospective buyer for some of that overstocked item, while the short stock item should be held back by substituting and other means when that can be done without injustice to the customer.

Referring again to the long stock item, nothing gives the yard such a bad appearance as an old black pile. When a pile of boards get black they are twice as hard to move as when they were bright and new. Old, dull-looking stock should be gotten rid of as quickly as possible at whatever price it will bring. It cumbers a yard and gives it a dismal appearance, as well as tieing up investment which it does not deserve.

Study the demands of your trade constantly. Find out which length of each dimension goes out most rapidly, and plan your stock accordingly.

You country yard owners: be long on bridge plank in June when the rains and consequent highwater wash-outs come. Be sure your shiplap piles are well up at harvest time. The farmers will be building granaries soon. Avoid ordering plaster, lime or cement in the fall. Have your post pile low when the snow comes. In short, be always vigilant and keep in touch with the demands of the season and the peculiar needs of your trade. Learn to know your people and their needs, the way a musician knows the keys of a piano. Provide what they need when they need it, and forever avoid providing what they do not need and can't use.

It is something of a tragedy to see a fine big lot of B. & B. finish stowed away in the shed of a little country yard, where the farmers only want to pay for number one common with which to trim up their modest buildings. A big pile of number one clear flooring in the shed and not a 2 x 4-16 in the yard. A tragedy indeed, and one how often enacted? Within the past month I have been in a little country yard where there is three thousand feet of as fine 1¼-inch white pine finish in the shed as you can find any place. Three thousand feet would fill every order that yard will have for thick finish in a year.

The consumer might offer his criticism that we are striving to get as much from him in the way of business and profits as possible with as little outlay and investment as possible. When he makes this criticism he is short-sighted indeed. Can any man stay in business without making interest on his investment? Certainly not. Who pays the interest? Mr. Consumer. If the investment is doubled by the accumulation of a lot of additional items for which there is little demand and a surplus of stock which the trade does not justify, does not the amount of that interest item necessarily increase, and must not Mr. Consumer pay that increased item in higher prices for the lumber which he buys?

No, we would wrong our trade, not benefit them. We would not increase the margin between buying and selling price, but decrease it, if anything; and lastly, but still of some importance, we would not allow our business to continue in a half-hearted, half profitable way, but make it prosperous and satisfying.

In closing allow me this one suggestion: Go home and take a walk trhough your own yard. Compute as nearly as possible the amount of dead stock you have. By dead stock I mean not only the worthless old junk which has accumulated, but that excess of good saleable lumber which is not necessary to supply the present demand. After making this computation in feet reduce it to dollars and cents, and you very probably will have a good surprise on hand. Then go out again and classify your stock at least approximately into three divisions.

First, the good, bright, saleable stock in amounts not exceeding present needs.

Second, regular items of stock in excess of present needs, but in reasonably bright and saleable condition.

Third, the old, black lumber in all grades and sizes. Exact amounts of short lengths. Small left-over lots not in demand and comparatively unsalable. Six months' old lime, plaster and cement. Old and defective mill work and any other unsaleable material which you have on hand.

The first division will take care of itself.

Keep the items of the second division constantly in mind and push the sale of them hard and constantly until they are eligible for entry to division one.

Hang out the bargain sign on the third division and make a price which will move it rapidly, regardless of what that price is. Clear your yard of it within a reasonable period at any cost.

This done, your investment will be reduced, your yard will be more inviting, and not only the air, but the reality of prosperity, will pervade your whole business.

Who Is The All Round Yard Man?

If you can answer this question with the two little words, "I am," then you just pat yourself upon the shoulder and remark, "Lucky, lucky Jim." For, do you know, that the all round yard men are as scarce as silver 3 cent pieces? Well, they are. And while scores and scores of men who are operating yards to-day, think they have all the qualifications necessary in order to be mingling with the all round class, yet if these same fellows were put into a "business sieve" and those that were not efficient in the art of managing, buying, salesmanship, collections, keeping stock, public mixers, bookkeeping, estimating, and "bill getting" were to be dropped through the sieve "when lacking" in any of the different branches mentioned, you would find (after the shake) that those who remained in the sieve would be so few and far between that it would require a police and a search warrant to find them. For while one may be efficient in salesmanship, he may be found wanting in management or collections. And again one may have a thorough knowledge of bookkeeping and still be found short in the art of buying or keeping stock. And while some may pride themselves in all the different terms mentioned save one, "stock keeping," why, being lame in this one qualification would cause his lamp to flicker if I were one putting him to the test as to whether or not he should be classed as an all around yard man.

Keeping Stock Important

While some of you no doubt will think that if keeping stock was all that was lacking in this man, that it would not be much, let me tell you that keeping stock is far more important in the way of increasing sales and profit than you may at first imagine. We have all heard, time, time and again, the old saying "Goods well bought are half sold." Now, this secret of buying an article at what it is actually worth or a few dollars under the list or be able to buy at an under figure is certainly a good strong point for any retail man to possess, and while I firmly believe that in order to meet as strong competition as the majority of we retailers have to meet, without question we should all possess that art of knowing how to buy. And still I feel that it is just as important to know how to care for that well-bought stock as it is to know how to buy it. There are too few who realize this fact, but it is true, nevertheless. And let me tell you that the yard man who takes pride in caring for his stock is the man who is going to reap the reward if there is any reward for any yard man to reap.

How many of you when you step into your yard and look from one bin to another filled with lumber, shingles, lath and other items carried in stock—how many, I repeat, realize the fact that those well filled bins and sheds are filled up with actual hard earned dollars? It matters not whether you carry a $6,000 or a $50,000 stock, each time you look upon that stock you should feel that it is just the same as looking upon so many thousand dollars and you expect the profit made on those items to pay your expenses and leave a fair rate of interest on your capital invested, don't you? Well, sir, how many of you have viewed your yard in this light? Even if your bins and yards were burgular proof and the capital within your yard were in silver, gold and currency and piled, stored and stacked as promiscuously as I have seen lumber, shingles and lath bunched away in different yards, do you think that you could go home at night and rest knowing that this amount of money was just lying around in any old haphazard way? Not on your tin-type. You could plainly see that unless you cared for this money in the proper way that some would become lost, torn and rot and at the same time you took stock you would find the stock sheet "way short." You could not figure it any other way, and so long, then, as your stock of lumber represents so many dollars, it's up to you, Mister, to thing enough of that stock to give it the proper care.

See That It Is Done Right

If you are operating a small yard and have a man in your employ who does your unloading and storing, make it a point to be with him until you have taught him how to care for stock. If you are in the city yard and your unloading and storing is done by several different haulers or where it is unloaded directly from the car to your yard or sheds, and you haven't the time yourself to look after the piling and storing, make it a point to see that your yard foreman looks after this part of the work, for it means $$$$ to you in giving this part of the lumber business special attention. I make it a point to be at the car when lumber is being unloaded or at the sheds when same is being placed in the proper bins, and any and all lumber that is received green or is in any way out of condition is looked after right then and there. We make it a particular point to have all green and damp lumber slated either in a well ventilated bin or else stack and stick same in the center of the yard until it has been thoroughly seasoned and the proper time to do this is at the time when it is received, for if you allow it to be placed in bins without being slatted, thinking that you will have this done at some future time, one is apt to forget this and think that it is altogether too much trouble to pull all those boards out and re-pile and slat. Consequently this green lumber will lie in your bins perhaps for several weeks before you need it to fill some bill, and then you will be heart-sick when you find the condition that this lumber is in. So don't put it off until to-morrow to do your slatting. Do it to-day, for you will find it quite embarrassing when you come to the point of offering lumber for sale if you lead your prospect out to your shed and want to show him what a good grade of No. 1 or No. 2 you have in stock. Then, when you come to "show down," you find that this stock of boards has become mildewed, black, and presents the appearance of a No. 4 in place of No. 1 or No. 2. Nine customers out of ten will pass this pile of boards up simply because it don't look right.

I remember very well being present in a yard when a customer drove in to get a load of lumber on a house bill, and when Mr. Retailer came to the items on the bill which were to be used for cornice work, the bill called for so many 1x12's "C white pine finish," and Mr. Retailer commenced to shove down the 1x12's from the upper deck for the customer to load. "Why," Mr. Customer, upon inspecting the first two boards, asked, "what kind of a package are you handing me now?" And Mr. Retailer replied: "That is "C white pine finish" for your cornice." "Well," says Mr. Customer, "that kind of dope don't go with your Uncle Henry. My bill calls for 'C white pine,' and if you call that dirty, moulded, black, soggy stuff C white pine you had better study your grading rules." Mr. Retailer tried to explain that the grade was all the bill called for, but that this "C" had been stored away a trifle damp and had become a little musty. But he could not get Mr. Customer to see the grade in that light, and thought that the yardman was trying to push off an inferior grade on him, and consequently he made up his mind not to stand for it.

Well, Mr. Retailer dug to the bottom of those 1x12's, but the farther down he went the blacker they became. Then he straightened his old back and pushed himself to the pile of "B," for he told me afterwards that rather than lose this customer he would lose a little on the "B" finish. So this is where the carelessness on the yard man's part made him loser, for it's apple pie to hard tack that if this yard man disposed of those 1x12's C he did it at a loss.

Looks Count in the Sale

It is also very important to have all your stacks of lumber piled as straight and evenly as you can, for one will find that by so doing that the neatness of your stock helps to sell a bill, and also you will find that neat, even piling will put you in a position to sell your stock at a better profit. You can take a lot of yellow pine ceiling or flooring and out of the very same lot bunch and pile promiscuously different lengths in one bin, and in the next bin have each length piled neatly by itself, and then lead a customer up to those two bins and place a price of $30 on the neatly piled ceiling and a price of $28 on the bunch, and four out of five will pay the $30 per thousand simply because it looks better. Of course, one will find this even piling a trifle difficult and tedious in storing lap siding, fir, yellow pine, drop siding and flooring, and all such items as are tied in bundles, but still for the extra time and labor it costs I think that one is repaid, as this sort of work keeps the stock so much more cleanly and salable.

Another good point in keeping stock is to have each of your timbers tagged with the length of same. This can be easily done some time when your yard force has a little leisure time. Take plain white table oilcloth and cut in 2 inch squares, and with a small brush and black paint or stove enamel mark the length of each timber on these tags and then tack with two small tacks on the ends of each timber. Using oilcloth and paint in place of cardboard makes your tags weather proof, but if your timbers are shedded, then cardboard tags will answer the purpose just as well. You will find that tagging your lengths in this way will prove to be a great advantage to you and your yard men, for you can plainly see at a glance the exact length of each timber, and it will save time and the trouble of measuring the different timbers each time you fill a timber bill. Mark the smaller dimension in your long shed with a tag showing length tacked over each rank of 2 x 6, 2 x 8 and 2 x 10's. It saves crawling back to see if this 2 x 6 is 26 or 28 feet long. You will find that this is about the only tagging that proves a winner in a retail yard.

There was a time when we numbered each bin (this is a good idea still) and we also placed a card on each bin showing the width, thickness, length, cost and selling price. The dimension we marked with plain figures, the grade, cost and selling price we marked with characters, but I do not approve of this marking for several different reasons: first, the character marking too often causes suspicion among your customers. They will come at you with, "You do not seem to be ashamed of the dimension by marking same in plain figures, but why do you use characters for the grade, cost and selling price?" Another will ask, "Why don't you use plain figures for your grades and selling mark, or do you sell the same grade to different customers at different prices?" Another reason for not tagging each bin as to grades, etc., is that you can not manage to keep the same grades in the same bins at all times, and unless you keep watch and change the marking whenever lengths or widths or grades ar changed, also prices, your help is going to become confused in the loading out of stock and quite likely will be loading out No. 2 boards in filling a bill for No. 3 because the tag on the bin said No. 3. Then, again, if you tag your bins with grades marked in plain figures, you will be picked up on that score. Some fine day a party will walk into your yard, and if he is in the market for drop siding, he walks over to your bins containing drop siding and sees your card marked No. 2, and then turns and asks you what price you have on this No. 2. You tell him, and he simply gives you the cold and glassy stare, and remarks that So-and-So offered him No. 1 at the very same price that you are asking for No. 2. Your tag has knocked you out of this bill, where, if you had not had the grade marked, you could have shown him a No. 2 and he would have been satisfied from the looks of same that it was good enough, and you could have then quoted your price and he would not have set you down as a thief and a robber.

Ignorant of Grades

For, when it comes to your customers knowing grades, there is not one out of twenty-five that can tell a No. 3 board from a D finish, so what is the use of trying to sell your trade by No. 1 or No. 5. Show up your stock, let them pick the grade they want by inspection and then quote them the price. If it looks good enough to them for a No. 1, don't quarrel with them in trying to make them believe it's a No. 2, and don't charge them a No. 1 price for No. 2 grade, either. Another thing necessary in keeping stock is to have each class of stock as much together as you can. Store your 2 x 4's in one section as much as possible. If you have a double deck shed commence with upper bin No. 1 and place your 6 x 8 foot 2 x 4's there, then the 10 foot, next 12 x 14's and place your 2 x 6, 2 x 8, 2 x 10 and 2 x 12's short lengths upstairs, for it is much easier to handle the short, light stock in the upper deck than it is the longer, heavier dimension. Also place your finishings, 1 x 4's ceiling, wainscoating, select common above, and keep the stock that sells every day in the lower decks where it will be much handier to get at and will not require so much hard "elbow grease" to load. Keep your No. 1, No. 2, No. 3 and son on in a division as much to themselves as you can, for it oft-times confuses a salesman to have the different grades piled in the same bin and all the same length. Never store stuff away in the upper deck because it is twisted, crooked, split or for any other reason that makes same off grade. Better by far pile this class of stuff right in the centre of your walk, so that you would have to fall over it a hundred times a day, for then if you found it to be a nuisance you would no doubt make an extra effort to dispose of this job lot.

Another thing necessary in order to have your stock appear right is to keep your yard alleys and driveways clean. Don't allow rubbish, such as broken boards, brick, stone, empty barrels and all such litter, to accumulate, as it always makes your yard and stock look "fuzzy." If you handle cement provide a proper room for same. Make this with a double floor with a dead air space between, and also have double walls, if possible, and if you haven't the double walls, paper the inside of this building with a cheap roofing or tarred felt.

Then see that your teamsters pile your cement propertly, and all bags received torn or untied have the cement in the torn bags transferred to good bags, and those bags that are untied have same retied, and make it a point to keep all empty cement and plaster bags tied in bundles as soon as you receive enough empties to bundle. Tie 'em up! Do not allow them to become scattered, trodden over and abused, for it does not take many bags, which become lost or which will be thrown out at mill upon the mill's count, to eat "way in" to your cement and plaster profits. Care for your lime with the same care you would your ice. In the summer, provide a room suitable by means of double walls and double floors with dead air space between, and you will not be meeting with so much lime loss caused by air slacking.

If you handle posts and poles have same ricked in neat ricks along your drives. Keep them in sight. It helps to sell them.

You can care for your doors by storing on end, taking care to have each door stand straight so same will not become warped or twisted from standing. Some other yard men lay their doors flat one on top of each other, keeping each size in a pile by itself and keeping the edges and ends even so as to prevent them from becoming dirty and soiled. Never show your line of doors with dirty hands, for often is the time when your finger marks will make a good No. 1 door look second hand. Provide racks for your balusters, brackets, spindles, beads and other small items. Store your windows on end and mark the sizes on the sides, so that you can see what each bundle contains without tearing down and re-piling. Store all your roofing on end, keeping all one-ply to itself and same with the two and three-ply. Provide a moulding rack with divisions made in same for each kind and size of moulding that you carry in stock, and provide this rack or room with doors that can be closed so as to keep out dust and dirt. When storing moulding away make it a point to mark each piece with the length on the end next to your door (lead pencil marking will be all that is necessary in marking). This will aid you wonderfully in filling bills, as you can count the feet as you pull the moulding out of the rack without having to measure same.

For storing columns one can easily place heavy brackets made from 2 x 4's up over your roofings or sash and store your columns in this way by laying them flat, one upon another. Do not allow loose lath to lie around your lath pile, but gather all these up and tie them in bundles and keep them from becoming scattered and broken.

Sheds Should be Ventilated

Always build your sheds in such a way that you can have them well ventilated, and do not allow weeds and grass to grow up around the sheds, as it not only shuts out the air that should circulate under your lumber, but it also causes the shed to rot, and then, too, it does not give the yard a very neat appearance.

Last, but not least, it is an important point which helps the appearance of the yard to keep your roof free from all leaks and your sheds well painted and also in good repair. Well groomed horses and neatly painted, well kept wagons make your stock look far more inviting. Make it a good, strong point to keep your office clean and neat. A good, sound scrubbing and thorough cleaning is a good start in keeping stock. You will find that by giving this subject a little of your time and attention it will make your work far easier and your sales and profits larger, and the advertising that a well kept stock will do for you will doubly repay you for all the expense and time it has cost you.—The Lumber World.

The Lumber Yard

The lumber yard of the nailed-up box man has an entirely different appearance from the regular retail lumber yard or the lumber yard of the manufacturer, says Barrel and Box. The difference, of course, in the piling is that the nailed-up box man buys dry lumber, consequently it is not necessary for him to put it on sticks. The lumber is piled up, one board on top of another for several layers, and then a cross piece is laid down at both ends and the process repeated.

Some box men make it a point to have a cross piece between every twenty layers. In this way it is a very easy matter to take stock, as it can be determined, almost at a glance, just what the pile contains without counting. Of course, this requires very careful piling, that is, piling that is done with exactness. Yet the necessary care in doing this is amply repaid when the time comes for stock taking.

There are no sheds in the box man's lumber yard for the reason that he handles no dressed lumber. This does away with a good many troubles that the retail lumber yard or the mill man has in supplying ample shed room and sheds built along lines that are most adaptable to the purpose, taking into consideration the local conditions and the kind of stock handled or manufactured.

Height of Piles

The box man can pile his lumber as high as he likes, but in most cases, where he is located in the city, there are regulations established by the insurance laws, which govern the height of the lumber pile. In Chicago this height is about twenty-six feet, and most of the box men pile so that the pile provides for a scaffold about twelve feet from the ground to facilitate handling the lumber from the upper part of the pile.

Fire protection is one of the difficult problems of the box man's lumber yard, as it is in all lumber yards, although it is much more difficult to burn a lumber pile that is not on sticks as there is not so much chance for a draft or so much opportunity for the flames to attack the individual boards. The question of fire, at any rate, must be considered by the box man in laying out his lumber yard. If he is located in a large city and within the city limits, he has the protection of the city fire department. If there is no fire department at his disposal, he is obliged to supply some protection with force pumps, drawing the water from a nearby stream or pumping the water from a well or spring into a tank to use as the occasion demands.

It is admitted by all those in the lumber business that the best way to fight a fire is to extinguish it at the beginning, if possible, as most fires of this kind spread very rapidly. For this reason the box man usually has barrels of water placed at either end of the alley with buckets attached to the barrel. In this way a great many serious fires are avoided, although this would prove entirely inefficient if the fire had gained headway at all.

Construction of the Alley

Some lumber yards in building their alleys use cinders, gravel, etc., but it is more frequently the case that the box man must plank the alley, as a great deal of his lumber is delivered to the mill on hand carts and it is much easier to run these carts on the planked alley, if they are heavily loaded, than to run them on a gravel road. Therefore, the planked alley is a saving in time and labor. Planking an alley is quite an expense, as 2-inch planks are used more often than anything else and such lumber is expensive, especially when it is considered that the alleys are often sixteen feet wide.

One box manufacturer has reduced this expense somewhat by using shorter lengths of 2-inch planking, i.e., for the alley sixteen feet wide he uses 8-foot planks, making a ridge down the centre, which is elevated from two to three inches. The process not only reduces the expense of planking, but the ridge in the centre is a kind of watershed, draining the water off rapidly and keeping the alley dryer than when it is made in any other way.

Sorting Lumber

When the lumber is received at the box factory it is piled in the yard according to widths. In this way, when an order is received in the factory, the yard man can take his lumber from the pile containing the widths that will cut the most economically for that order. Where the box manufacturer is making boxes of both pine and cotton wood, he will sort his lumber from four to twelve inches and wider, in both kinds of lumber. He will have a miscellaneous pile from which he can make selections suitable for this kind of orders. It is, of course, more work to sort the lumber by widths to put it on the yards, but the economy of this operation is shown in the fact that it is done in the yard by a man who is paid about $1.75 a day. If it was not sorted in the yard, it would have to be sorted in the mill and the work done by a man who is getting something like $3 a day. Some box factories will find it necessary to pile their lumber according to grades, but in most cases it is more common for the box man to pile his lumber according to width.

The nailed-up box man's lumber yard is an interesting part of the business and a part of the business that has received very little attention by the box association. It is not altogether unlikely that a detailed discussion of this phase of the business would bring out some features that would be of general interest to the box fraternity and assist it in bringing about some small economies that would eventually work to the profit of the business. It is hoped that a further discussion can be had on this subject.

Comparison of Yellow Pine and Douglas Fir

Wood using industries in Canada reported to the Forestry Branch for 1910 the use of $542,000 worth of yellow pine and $69,500 worth of Douglas Fir.

From scientific investigation and experiment it has been ascertained that our native Douglas fir could in many instances replace yellow pine as at present used in Canada. Yellow pine is necessarily all imported from the United States, and if a species of native wood could be introduced to take the place of yellow pine, the change would be of great benefit in the development of Canadian industry. Douglas fir is a lighter wood than yellow pine and has a greater limit of elasticity, that is, stands more bending without taking a permanent set. Likewise compression perpendicular to grain is resisted equally by both species. In the western states the uses of this wood are being rapidly extended and its recently discovered qualities are introducig it for purposes in which previously only yellow pine was thought fitted. Douglas fir is a light and strong wood easily worked. For railway cars and vehicles it is used throughout the United States where its elasticity and durability recommend it for nearly all purposes except where a hardwood has to be used. Because of its beauty of grain and the attractive effects which may be obtained by staining, it is very popular for inside panel work, door and window frames and cheap classes of furniture, particularly "mission" furniture. Furniture, car and vehicle manufacturers would benefit if douglas fir was used to a greater extent in Canadian manufacture.

Door Making in the Custom Planing Mill

Looking at the construction of a door, it does not, at first glance, seem a very difficult proposition to make one. However, when one comes in contact with this part of mill work it becomes apparent that it is not always quite such an easy matter. Especially is this true in a mill which does considerable jobbing.

As it is a part of my work to write out all cutting bills for doors, sash, etc., I come across some very puzzling propositions in sizes. For example, somebody has ordered a front door, say 3 ft. x 6 ft. 10 in., 1¾ in. thick, having one light 28 x 48 in. This party has seen a door somewhere which has appealed to his taste, and therefore would like to have one like it. This is, of course, very reasonable if it were not for the fact that he did not take into consideration that the door was higher than the one required. The door desired is to have one panel at the top and one at the bottom, as shown in Fig. 1. A door which is not higher than 6 ft. 10 in. will not allow of a cross-panel at the top, for the reason that the upper panel would obstruct the view; the distance from the top to the glass should not be less than 15 in. It is evident then that the top panel must be cut out.. The width of the glass desired being 28 in. and the door being 36 in., would only allow of 4 in. wide stiles, which is not enough for a front door, because it will not allow of a heavy lock being used. The stock for front door stiles should not be less than 5 in. width.

In this case all kinds of trouble have developed in the making of this door because the party ordering was not conversant with the requirements. It appears, therefore, that the making of a door is some trouble after all. Of course, the door could be made as ordered, but no end of difficulty would develop if it were so made, and the mill man would be blamed for it. This is not an exceptional case, for it has often come under my observation.

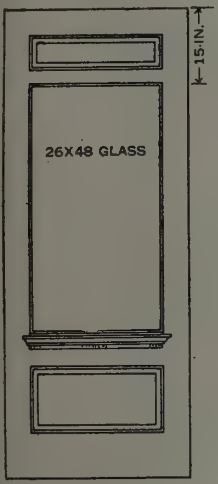


FIG. 1—FRONT DOOR

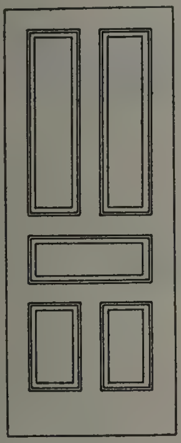

FIG. 2—FIVE-PANEL.

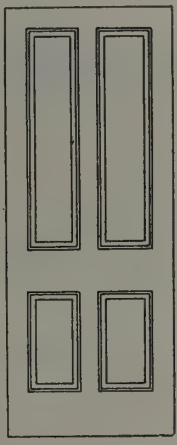

FIG. 3—FOUR-PANEL

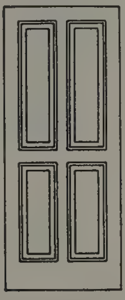

FIG. 4—DRESSER DOORS

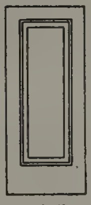

FIG. 5

There are several things, therefore, which must be taken into consideration in the making of a front door, most important of which are, do not bring the upper panel below the line of vision, nor make the stiles less than 5 in. wide from the glass line.

Another case which happens often is where the glass size is given in height, and also the panel arrangement, and when you start to lay off you find that the size of the glass is too long for the required panel effect. Of course, these difficulties will not arise so easily if one takes the order who understands the requirements thoroughly, but the trouble arises from the fact that the order may have been sent by letter from somebody who does not understand the subject thoroughly.

Another error, which may occur with almost any carpenter, is in ordering a number of doors of the five-panel arrangement now very extensively used. Among these there may be some which are only 20 in. wide. It will be apparent at once to the door man that this width will not allow of a five-panel arrangement, but should be three panels, such doors being of the same height as the five-panel doors.

It is not practical to make a five-panel door less in width than 22 in., in order to harmonize with the others, whose stiles are 4½ in. wide, as a rule. In trying to make a five-panel style for a door which is only 20 in. wide, we find that the two stiles and the mullion added together make 13½ in., leaving only 6½ in. for two panels, which would look very bad, to say the least.

The glass sizes for five-panel doors are always standard, being 34 in. high for a 6—8, 36-in. for a 6—10, and so on; these sizes are always adhered to in our mill. By cutting out the upper two panels and mullion, it is very easy to convert a five-panel door into a front or rear door with one light. The five-panel door is shown in Fig. 2.

Another variety of door is the four-panel style, also used quite often. In this the top rail is the same width as the stiles, the middle and bottom rails being 9 in. wide. The distance from the bottom of the top of lock rail is 3 ft.—that is, to the plow—so that in case the door should be changed to have glass in the upper part, it would leave a regular size opening for the glass. Of course, it sometimes happens that a door is to be of an uneven height, in which case the lock rail should be changed to allow of a regular size glass being used. However, these cases do not often happen.

In making a five-cross-panel door the rails are of the same width as the stiles, except the bottom rail, which is usually 9 in. wide. The panels in a cross-panel door we usually make of a uniform width. If a one-light door is required in this style, we usually take out the upper two or three panels, and if this gives an uneven-size glass, the panels are laid out so as to make the glass size even. This slight deviation in height will not be noticed among the other doors.

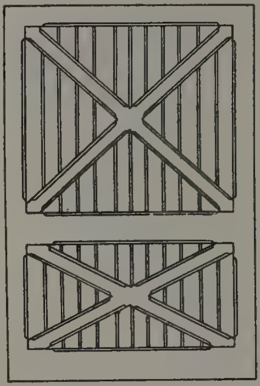

FIG. 6—THE SHOP DOOR

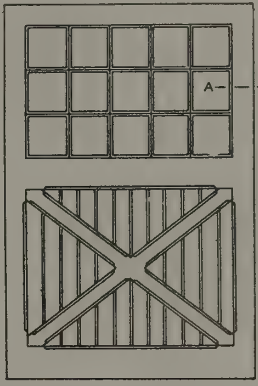
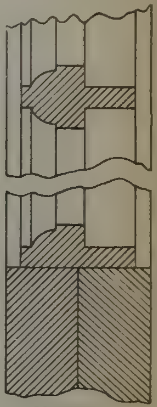


GLASS IN UPPER PART



SECTION A A

Types of Doors Usually Made in Custom Planing Mills.

Dresser doors, or any of the smaller kinds, are also a troublesome proposition because of the many odd sizes that are required. We have a certain rule in making these small doors, to which we always adhere unless these is a detail requiring a certain arrangement. If a door is 18 in. or wider, we make it two panels in width; if 17 in. or less, one panel in width, using 3-in. stiles, top and middle rail and mullion, and a 6-in. bottom rail. If a door is 3 ft. high or less, one panel in height is used. If it is over 3 ft. in height, we make it two panels high, placing the middle rail from the centre down. Fig. 4 shows this arrangement and Fig. 5 the 3-ft. door.

The sliding door, usually used between two rooms, is the next problem, and is also somewhat difficult because the various contractors have different rules in studding up for these doors, and the man who measures up for the mill is sometimes in doubt as to how wide he should make the stile which goes into the partition, also the head rail.

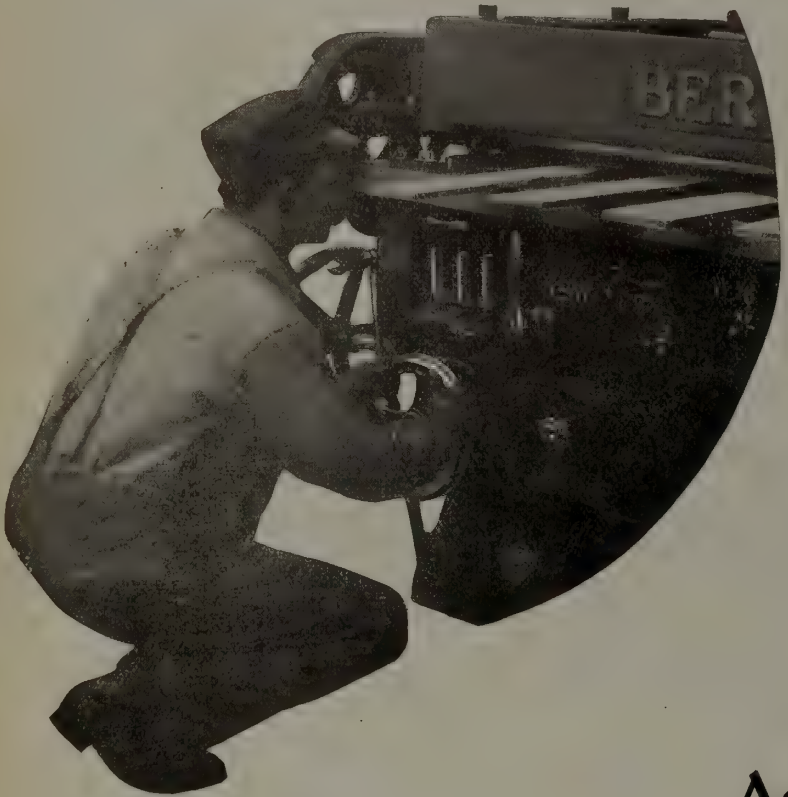
In case of the double sliding door we make the back stile and top rail ½ in. wider than the meeting stile. In the single sliding door both stiles and top rail are made ½ in. wider, so that when the door is closed it shows the same width of stock all around.

Last, but not least by any means, comes the batten door, the kind usually used for the outside of factories, stables, etc. Of these there are also different styles of construction. In many cases we make the frames 1⅛ in. stock and the backing of beaded boards. If the door is 3 ft. wide or less, the beaded boards are put on vertically and no braces are used. If wider than 3 ft., then braces are used as shown in Fig. 6. In case of a double door there is only one brace used in each panel, the highest point toward the centre of the doors, so as to bear the weight and prevent sagging. Often the beaded back is put on diagonally, which makes a very strong door.

Then there is the shop door, made of 1¾-in. stock, with beaded panels placed in the centre in a plow. These doors should be made with the lock rail placed 3 ft. 6 in. from the bottom up, the stiles and top rail being 6 in. wide and the bottom and lock rails 9 in. in width. The braces are usually made 4½ in. wide, and this rule we always follow where there is no detail given. If the doors are very large, everything is made larger in proportion, the stiles sometimes being 12 in. to 14 in. wide. This, however, does not often

Sanding Fine Furniture Stock

Requires a sander with adjustments easily and quickly made, and with all operating parts so simple in construction that keeping them in perfect alignment does not require expert attention. Every working part has been simplified for this reason on



Berlin Triple Drum Sanders

No other sander has carried this idea so far as the Berlin, because no other builder recognizes that simple adjustments increase the efficiency of a machine.

Ask for Sander Booklet

TAKE the Drum Adjustment for instance. Each Berlin Sander Drum may be adjusted separately or all of them simultaneously by means of the same hand wheel. Thus drum adjustment is made far more accurately and in less time, than where there are three handwheels necessary.

With the one handwheel all drums may be raised equally at the same time, then the separate drums properly adjust for correct proportion of the cutting. With three separate handwheels all adjustment is a matter of guess work until several pieces are run through to test the setting of the drums.

Even if a new operator were to make poor adjustments of the drums, good stock need not be ruined by taking too deep a cut. He has the reverse at hand to back out the stock. This same lever starts and stops the feed instantly. No other sander built has this feature.

Another exclusive feature of the Berlin is the feed control lever. With this lever three changes of feed speed are obtained as well as starting and stopping. Feed changes on other sanders are made by changing pulley sizes for the different speeds.

Adjustment of feed rolls, press rolls and drums for aligning are simple and quick. It requires only the loosening of set screws and turning up or down the bearing screws to secure perfect alignment. Moreover once aligned they remain so.

No sander part receives harder wear than the oscillators; but this is easily taken care of on the Berlin. The adjustment collars are kept in place by set screws. If any wear occurs in the oscillator box a set screw is loosened and the collar turned so that all lost motion is taken up. No other oscillator part requires adjustment. The oscillator box is cup shaped and will retain oil up to the shaft bottom. Better investigate further.

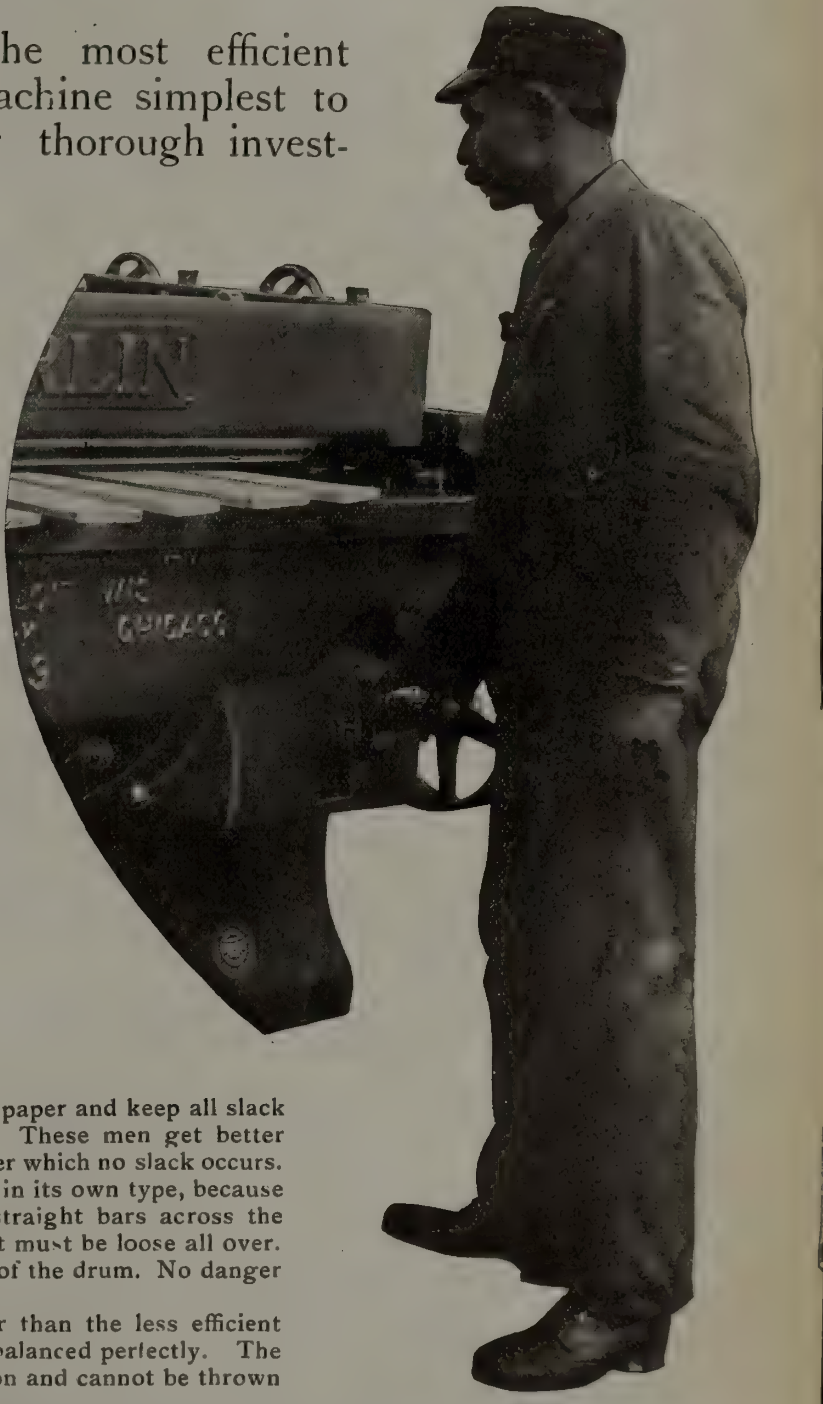
Operators Should Choose Sanders

Given the chance, operators will choose the most efficient sander, because an operator prefers the machine simplest to operate with drums easiest to cover. After thorough investigation he would like and recommend



Berlin Triple Drum Sanders

One operator may prefer the **spiral** type of drum, another the automatic take-up. He may choose either on the Berlin.

SEND FOR SANDER BOOK

The Berlin spiral drum is well known for its very effective sanding and polishing abilities. Paper is wound about it spirally with edges lapping so that there is no break in the cutting surface. A groove is made in the drum shell and covering to allow of lapping edges without a ridge. Under average conditions this drum is the most efficient built.

The spiral drum does not depend upon automatic means to tighten the paper and keep all slack out of it. Many operators prefer to know just how tight their paper is. These men get better results with the spiral because they tighten the paper to suit themselves, after which no slack occurs.

The Berlin automatic take-up straight opening drum has no competitor in its own type, because of the flexibility of the take-up device. All other drums of this type use straight bars across the drum to clutch the paper, so that in order to take up slack in the paper it must be loose all over. The Berlin flexible device takes up slack wherever it occurs in the length of the drum. No danger of paper folding over, creasing and tearing on this drum.

Paper may be put on either of these Berlin drums as quick if not quicker than the less efficient drums offered by would-be imitators. Another thing—Berlin drums are balanced perfectly. The straight opening drum as well as the spiral is balanced in running condition and cannot be thrown out of balance.

There's a 32-page booklet on Berlin Sanders that all operators and superintendents should have. Send for it at once. It's free and full of information.

occur except in railroad jobs for roundhouses. The railroad company furnishes details for these doors, which must be closely adhered to.

Another kind of shop door, and one which is very often used, is the kind with a number of small lights in the upper part. A cheap way, and also very satisfactory one, is to frame the lights up of mullions which are of thinner stock than the door. For instance, if the door is to be 1¾ in. thick, we use 1⅜-in. stock for the glass frame, as shown in the accompanying detail. Another method is to make a sash which is raised the same as a panel and made to fit into a plow; this method is, however, more expensive than the first. We make very many of these shop doors, and with very satisfactory results.—The Wood-worker.

Some Ideas of a Consumer*

By E. K. Pritchell.

One of the most important features of a panel, from the standpoint of the furniture manufacturer, is the matching of the veneer. Drawer fronts and prominent panels must be properly matched. Furniture manufacturers are compelled to make many panels which they would much prefer to buy made up for them, but for the fact that they cannot depend on the proper matching of the face veneer.

More or less trouble is experienced in the separating, or perhaps it might be better stated, in the non-binding of the various plies of the panels. We frequently find panels which, while apparently perfect, will loosen up after a time and thereby become unfitted for the use for which they are intended.

A point which has been the source of great expense and annoyance to the users of panels is the prevalence of what are termed hair-lines. After the surface has been finished and the varnish dried, a slight, almost imperceptible, line will appear in the surface where the veneer has been joined. Some have been able to overcome this to an extent, but it is something that should have a great deal of attention from the manufacturers.

Another source of trouble is where the centre of the panel is not of uniform strength or density, thereby allowing the centre to indent under the pressure which is applied in gluing. A little care in the sorting of stock for centres by intelligent, but not necessarily high-priced help, would materially eliminate this trouble and give more perfect panels from the press.

The jointing of centres where more than one piece is used is important. The centre should be well joined, and on high class work these joints should be so made as not to be perceptible after the panel is glued up and the finish completed.

It is unnecessary for me to go into any detail as to the method of handling glues. I feel it would be out of place for me to do so, for all of you are better informed on this subject than I, but the result of carelessness in the preparation and application of glue is so serious that I cannot refrain from mentioning it.

The quality of the glue should be sufficiently high to insure perfect work. When a satisfactory grade has been found, adopt it and do not be led off for a fraction of a cent lower quotation. I am convinced that much more more money is lost in trying to reduce the price of glue than has ever been made thereby.

Glue and glue handling is of sufficient importance to be entrusted to someone of a high quality of integrity and absolute reliability.

I cannot refrain from drawing your attention to a practice which I believe is responsible to a greater extent than anything else for defective panels. That is the practice of rushing them through the factory. In most veneer mills great care is taken to see that all centres, faces and backs—the various plies of the panels—are thoroughly dry. Expensive machinery is installed to accomplish this and no pains are spared to extract every particle of moisture before the stock is taken to the gluing department. In this condition the glue is applied. The larger part of the glue solution is water. The various parts or plies of the panels being so absolutely dry and in the best possible condition to absorb moisture, all this water is taken into the wood. While the panel is in the press or the retainer, there is no way for this water to evaporate. When the glue is set the panels are removed from the retainers, but are put up in solid piles with no chance whatever for the moisture to escape. They may stand here for several days and are then taken to the trimmer. They are removed from the pile, trimmed and immediately repiled. Then they go to the shipping room and are put into crates without separating any more than is necessary in handling. All of this time, you will note, there has been little of any time when the panels have been separated so there could be any chance for the moisture, which has been absorbed with the glue, to escape. I cannot overcome the conviction that panels should be "stuck up" and allowed to dry for some time after gluing or stuck up in a low temperature redrying kiln.

I fully realize that this would require more factory room, also small additional expense, but I am also as firmly convinced that it would be fully justified and more than offset by the quality of panels that would be turned out.

An item of waste and therefore one of expense which might be saved by more careful inspection is occasionad by shipping defective panels. This may be done through oversight or with the idea of "taking a chance on their going through." Such panels have all the expenses in their cost and in addition the transportation charges. These defective panels when charged back by the customer are counted by the manufacturer as an expense item and therefore enter into the cost of the product which is eventually paid by the consumer. This is manifestly unfair, for while it may amount to a certain percentage per annum of the actual expense, it is an unjustified expense, and the consumer should not be asked to stand any part of it.

I note a commendable attitude on the part of some manufacturers in using thicker face veneer. This prevents to a large extent the tendency of sand through. While this thicker face veneer is a little more expensive its use effects a substantial saving because of the greater number of perfect panels and fewer culls. There is a tendency, however, on the part of these manufacturers to charge a higher price for such panels on account of their thick faces. I do not believe this is justified, for the saving in defective panels is certainly more than offset by the slight additional cost of the thicker face veneer.

Waste in the building up of panels is an important item. The figures mentioned to me by some of the largest and most reliable panel manufacturers are simply astounding. It would appear that such a waste was possible only through the utmost carelessness, however, I cannot believe this to be exactly the case. I do think, however, from my own observation, that a part of this waste could be eliminated by selecting veneers which more nearly coincide with the width of the panels or multiples than are now often used. This is true in the manufacture of the small quantity of panels that are made in our own factory and consequently it would seem that even greater economy could be effected in the large volume manufactured by most of your plants represented here.

The matter of standard thicknesses is one which it would seem could be regulated to the great advantage not only of the producer but the consumer. One factory I know of standardized the thickness of its product greatly to its advantage and at no hardship to its customers. It took a little good sensible argument and business sense, but in no way lowered them in the eyes of their customers.

As most users of panels also do some veneering it would not seem out of place to discuss the matter of veneers to some extent as well as that of panels. The object of using veneer, as stated earlier, is to produce high class effect at a reduced expense and at the same time to conserve the product of our forests. In this connection I would call attention to the fact that figure is the prime essential in veneer that is used for faces.

All veneer should be cut to show the very best possible figure and the greatest care exercised in making it smooth. Regardless of whether it is sawed of sliced, the smoothness of the veneer is, after figure, the next consideration. You will readily appreciate the fact that where veneer is unevenly cut or badly scored, it must be worked down to the thinnest point. Even if it is cut thick enough this surfacing occasions waste of labor and material, beside the extra sandpaper and time consumed in bringing it down to a smooth even surface.

To cut veneer of uniform quality and thickness it is necessary to use a uniform tempered, accurately ground knife, which must be ground with care on an automatic knife grinder, which is rigid, and where the knife is firmly bolted to a stationary solid frame, that is incapable of any spring, then permit the grinding wheel to travel back and forth, taking but a very light cut, which is covered with a liberal stream of running water, ever remembering the maxim that "haste makes waste."

Occasionally a knife which seems a little hard at first, after being ground the first time, will prove satisfactory and hold a good edge thereafter. Knives that have been used and ground two or three times and seem to be working all right will continue to do so until they are worn out and subsequent troubles are in nearly all cases traceable to inexperienced or unskilled labor and handling, for which no fault can be attached to the tool or its maker.

Among the defects that may be noted in veneer knives are poor welding, uneven grinding, unsuitable or uneven temper, errors in location of slots and poor joints in the case of sectional knives. A poor weld of but an inch or two rarely cause trouble and can be safely used, but if several inches long, may give trouble through slivers working into the opening, forcing the tool steel away from the backing and out of line, possibly spoiling the blade for future use. It is important that it should be ground straight and true, especially on the face or steel side, not permitting hollows or high spots to remain, which result in an uneven cutting edge and interfere with the successful operation of the pressure bar.

---

* Read Before the National Veneer and Panel Manufacturers' Association.

A few section veneer knives have been used which are joined together with a key or lock, but there is a limited demand for them which indicates that they are not altogether satisfactory in view of the difficulty of making perfect joints, the great liability for the sharp corners to break at that point and the very little saved in the total cost of such work.

Many knives are ruined from coming in contact with metal imbedded in the wood, one of the bugbears of the veneer man's work, one of the worst features being the finding of fragments of shells forced into the tree in the days of the civil war. Spikes, iron stakes and other metal substances, including bullets, are frequently met with, although the latter cause no trouble unless they may have been steel capped.

Veneer is used for a great many purposes, among which may be noted rotary and sliced for furniture and desk work, sliced for cigar box stock, and thin stock for barrels, crates, boxes and to pack meats and bottled goods for shipping.

Merchantable veneer is cut as thin as 150 to the inch and in all sizes up to three-eighths of an inch thick, sound and good.

As might be expected, one grade of temper would not be suitable for all such work, hence it is necessary for the knife man to have intimate knowledge of the work to be done to enable him to determine what degree of temper would be best suited to the case.

One of the knife man's greatest trials is in connection with complaints from customers, who stoutly maintain that knives could not have been overheated or injured at their factory, as "the same man and the same grinder had ground many knives without injury for years," but it is the exception that proves the rule, and the fact remains that anyone can burn any knife, or any grinding machine, with any grade of abrasive wheel, no matter how experienced he may be. It is not necessary to burn knives frequently to prove such a contingency exists, or that the best of mechanics may err occasionally.

Segment veneer saws are used in sizes varying from 64 to 84 inches in diameter, each segment being firmly screwed to a steel flange, with spacing of about one-sixteenth of an inch between each. These segments are ground with a bevel for about four inches in depth, back from the rim or teeth, slightly concaved, with this side of the saw set to the outside, or away from the stock being cut. Points are usually spaced at three-fourths of an inch, with a peculiar pattern tooth, to give the best results in what is probably the most delicate operation attempted with a circular saw. Segments at the rim should be pretty stiff and ground with care to insure a straight and true surface on the flat side, beveled down to about 24 gauge at the points for economical cutting. Sawyers use but a slight set and that only for a fraction of an inch back from the saw points. It is absolutely essential that segments be ground of uniform thickness and lined up so that each fit exactly in line on the flange, with a set that is adjusted to a nicety, with all teeth cutting equally, avoiding high points, which result in torn or scratched veneer. It is customary to remove segments about once a month, returning them to the saw maker for rebeveling and adjustment.

This class of saws are usually filed by hand without removal of the segments from the flange or saw from its arbor, which method removes the possibility of overheating, which grinders of the knives experience.

Veneer Knives and Saws—Their Use and Treatment*

By R. J. Cant*

Veneer knives and saws are items of considerable expense to the manufacturer of high-grade veneers. This expense, of course, varies with the degree of care either may receive in th hands of employees, whose duties require them to grind and prepare them for the machine operator.

Veneer knives are made in various sizes from one to sixteen feet in length, and are usually of laid steel, or of tool steel, which has been forged to low-grade steel, the object of which is to produce a finished knife that will remain straight, without warp or wind, as would be the case if made wholly of tool steel.

Tool steel has a well-known tendency to contract and buckle in the process of tempering, hence the desirability of producing knives in this manner, so that they may be readily straightened in making and afterwards. Much of the unfortunate troubles experienced in grinding are overcome by the use of this softer steel in the backing, but enough trouble remains to continue to annoy the veneer maker.

The methods pursued and materials used in a modern knife factory are of such a nature that perfect knives can be guaranteed of much superior quality and far better finish than ever before.

Many consumers of machine knives evidently are not aware of the great amount of work required, nor the years of experience devoted to the veneer man's peculiar needs, necessitating the employment of many expert mechanics of years of education, together with a careful selection of high-grade finishing machines, to enable the knife man to insure satisfaction to a critical class of manufacturers.

A straight knife, of well-welded steel and with a temper suited to the character of the work, is absolutely essential, and the absence of either of these qualities, even in a modified degree, will result in subsequent trouble. In ordering knives the veneer maker should always state the character of the work they will be used for.

A recent writer has truly said: "The man at the knife grinder cannot change a poor knife into a good one, no matter how much skill or care is exercised, but when the skill and care are lacking it is very easy to change a good knife into a bad one." So many knives have been injured in the operation of grinding through carelessness, ignorance or worse, that possibly some information along this line may prove interesting.

Grinding the thin edge of an expensive veneer knife is indeed a delicate operation and requires an order of skill which many veneer makers do not seem to appreciate.

It is possible to overheat, burn or crask any veneer knife, in this operation, in such a short period of time that it seems incredible.

Few realize that but the fraction of a second is required to do the harm that renders many otherwise perfect knives useless, through the drawing of the temper or by cracking.

Several kinds of artificial grinding wheels are being made for this work, some of which are of excellent quality, but others are quite unsuited to the work and cause trouble.

Turkish emery was among the first abrasives tried, but it being of rather soft nature indicated that it was undesirable, and it is also true that some abrasive materials are either too hard or are unsuited for the grinding of tempered tool steel, in view of its great liability to overheat the work.

Much experimenting with various forms of abrasives, with different processes employed in the manufacture of artificial grinding wheels, seems to indicate that the safest and therefore the best abrasive to be pure corundum, a natural product found in its purest state in Canada, containing ninety-five per cent. of crystalline alumina, which is the ingredient that does the cutting, and this percentage is by far the greatest found in any abrasive. The manufacturers of artificial grinding wheels have made great progress in perfecting them and wheels of the present day are far superior to those of former times.

It should not be construed, however, that this advance in the science has reached the point where the grinding of expensive veneer knives and saws may be accomplished by unskilled labor without fear of injury.

Wheels which prove most satisfactory and serviceable are those in which the abrasive grains are known as size No. 30 and the grade, or bond, is J or K. The most satisfactory bond is that which retains the service of each individual grain for just so long as it continues to cut, but releases it at that moment it has grown so dull that it refuses to perform its function and becomes an increasing danger through friction.

This is precisely what a hard wheel does—owing to the hardness of the bond, it retains its hold on the grain after it has served its usefulness, with a tenacity that frequently nothing but an emery wheel dresser will dislodge.

Ordinary grindstones have been used with safety, but can not be relied on to run true and are not recommended for this work. The use of plenty of water is of benefit, yes, a necessity, in grinding, but the lack of it altogether is less serious than the poor economy of allowing a scanty stream of water to trickle down on an overheated blade, wher the laws of contraction and expansion are very apt and often cause it to take advantage of this opportunity to crack or snap, in this case the quantity of water used being too little to serve its intended purpose of cooling, by being allowed to run on the blade when it is in a heated condition. The longer the bevel is ground the greater the danger, as thin tool steel is very easily overheated, and knives ground in this manner are not recommended, nor are they guaranteed by the knife manufacturer.

Face grinding should not be attempted by unskilled persons, nor should it be done to such an extent that the value of the temper is lost by cutting through it into the softer structure of the interior of the tool steel.

Fine veneers cannot be cut with a poorly tempered or poorly ground knife, but fortunately it is not necessary to use them, as excellent veneer knives may be had from well-known makers, who are willing to guarantee satisfaction.

Mr. Samuel Owen Greening, president of the B. Greening Wire Co., of Hamilton, Ont., died at his home on Aug. 31st in the 65th year of his age.

CAMP DEPARTMENT

The Organization of a Lumber Camp

By George I. Ritchie.

The first thing to be considered in organizing a log job, or re-organizing one that is disorganized, is to either get or see that you have a competent, reliable, energetic, sober logging superintendent.

I am speaking now from a position of a plant superintendent, from now on we will place ourselves in the boots of the logging superintendent, who is supposed to be taking on a new job.

To find the trouble of a disorganized logging operations, we must always, if the reader will pardon a common expression, get the cart before the horse. It we are not getting logs enough at the mill, we at once surmise that the loading crew is not getting the capacity out of the machines or that they are not getting in full hours, in fact, where the trouble is we many times do not stop to figure out, but merely blame the logging department, which nine times out of ten is not at fault.

Most cases where logs are not coming to the mill in sufficient quantities it is the fault of the track department more than that of the loading. More than likely the track is not laid to the logs that are skidded, so that the loads can get them, or because the track which is laid is so bad that wrecks knock the loader out of full running time. Sometimes the engines are broken down or disabled from said wrecks, or from step grades and bad roads. Many times the grades are so steep and bad that the switch engine cannot get out with one-fourth of a day, much less to say a half-day's loading at one time, which is the cause of the loader being out of empties. The log proposition is to-day much heavier than it was ten years ago. All of the easy logging is a thing of the past; most of the close logging is a thing of the past; the main line haul is getting further and further each year; which causes delay in delivery of the main line trains of empties. The hills that were considered too rough to built tracks in ten years ago are being logged out now, and where an engine has to switch out from four towns to one car at a time, and sometimes having to call for help to get out this one car from a spur, is taking up so much time getting a train to the main line, that by the time the switch engine gets back to the loader with empties she has been idle for from one to three hours. It used to be that an engine could switch the loads from one loader loading forty cars a day to the main line by itself, but it is getting now to where a swing engine is necessary on most every job and sometimes two of them. So rather than blame the loading crew with the shortage of logs, we will start in the logical order, as aforesaid, taking the northern section of the United States to start with and subdividing this up in the following order: Camp conditions, cutting, hauling or skidding, loading, surveying right of way, grading, steel laying, maintenance, main line, trams, skidway at pond,etc.

Camp Conditions

To bring order out of chaos, a good place to start is in the dining-room. I find that when one feeds well in a logging camp the news spreads rapidly, and regardless of the wage scale, the kind of timber or ground, teams, machines, etc., one has does not make the difference that the boarding house does in the way of attracting or dissatisfying the labor. I have been out on a great many man-catching trips, and the first two questions they ask are, "How do you feed, and how often do you pay off?"

It is a mistake to think that by establishing a rule not to pay off between pay-days will hold good men, from the fact that good men always have a stake to leave on any time they get ready to leave, whether you pay them or not. Furthermore, good men become poor hands when once crossed with this proposition.

I believe that when a man becomes dissatisfied and wants to go, the best thing to do is to let him go, as he will not take the interest in his work afterwards that he has up to that time, and while it causes a little more work in the office, men will come and work for you lots of times. Say, for instance in the winter time, when you need labor to pick up your track out of the mud for a week or two, month or two, at a time, when they would otherwise not come if they thought they could not be paid off when this short job was finished or when they had stayed their limit. Negroes especially are easier to keep when paid off once a week or once every two weeks. It is argued by a great many that if you pay off once a week or once every two weeks, the negro has nothing coming, so they claim, and this is a fact, the main reason why the negro likes to be paid off oftener is so they can keep up with their account all along, and because they want a little money occasionally.

Show me the camp that feeds well and is not full handed, and I will show you one that needs a new logging superintendent. Comfortable beds, roomy quarters, well aired and ventilated and clean, all help to hold labor. I believe in having a night watchman or a negro waked up at three o'clock to build fires for all hands to get up by in the winter, is another way of getting the good will of the men.

Suppose the boarding house does run behind $50 per month, which is not necessary at all with the proper cook in charge, what is that compared with $1,000 a year paid for sending off after men? Have plenty of wells in the camp for families and keep the camp well drained to prevent sickness. Have the loader bring in some old dead logs and pine occasionally free of charge for the families. This won't break you and makes everybody feel good.

In locating a camp, try and find a place in an open field where it will be pretty and shady, rather than in cut-over timber, endangering the houses by fire, and not in tall big timber, as a great many are afraid of lightning.

Having the camp to where we feel satisfied with the organization and that we have the crew well satisfied, the first step in the active end of the business is toward the saws.

The first thing to do in this job is to get a competent team foreman, who from the fact that he is a capable team boss, must necessarily be in line with a lot of good drivers and woods men generally, which is one of the most essential qualities that go to make up a good foreman in any department. The logging superintendent is supposed to know in a week or two what kind of lieutenants there are already on the job; of course, if some or all of them are first class of men there is no need of changing them. In fact, it is a very bad idea indeed to change men when first going onto a job. It is best to avoid it if can possibly be done. It is a very poor policy to take along with you men who have worked with you on your last job, from the fact that it makes the men on the job that you are now taking feel that you think more of your old men than you do of them, and their jobs are in jeopardy, thus dissatisfying them when otherwise they would not be.

Go from team foreman on down the line from the said team boss to the scaler and all men that the logging superintendent is supposed to hire, they are to be taken into consideration and culled out according to their deficiencies.—Lumber Trade Journal.

Feeds and Feeding

Feeds and feeding have become a most important problem for the logging camp superintendent, and one which requires careful study to get the best results from horses, mules and oxen. Only a few years ago almost any kind of feed might be dumped on the commissary platform, shoved into the warehouse, and doled out to the logger. About all he knew of the feed was the price.

In these days of the specialty feeds, laws have been enacted in most of the States where heavy feeding is done. Because of the strictness of these laws the feeder is being protected, whether he really intends he should be or not. Wonderful progress has been made during the last ten years in the manufacture and disposition of feed stuffs of all kinds, and more especially in those known as specialty feeds. The compounding and balancing of rations for domestic animals are now carried on with as great care—and often with greater care—than is the manufacture of foods for human beings.

Thirty-four states have feed stuffs laws, the primary object of which is to protect the consumer—the feeder. If there were no laws to compel the manufacturer or other person placing feed stuffs on the market to give correct information to the feeder it would indeed be a sorry lot of live stock in some sections of the country. The necessity for this information lies in the use or misuse of byproducts of the grains, the refuse of elevators and mills in feed stuffs, and the disinclination to withdraw quantities of useless or harmful weed seeds.

Not many years ago specialty feeds were practically unknown, and byproducts of the flour and corn mills; namely, bran, middlings, mixed feed, red dog, and hominy, grits, meal and gluten feeds, were about the only feeds a logging superintendent thought of outside of corn, oats and hay. But conditions have changed and the so-called specialty feeds are manufactured in great quantities in many sections of the country. Some of the larger concerns have daily capacities running into the hundreds of tons.

Mill feeds always have been considered standard, and so they doubtless will be as long as flour and corn goods are manufactured. But in the feed industry, as in other lines of business, the inability to supply the demand, and the increased call for feed stuffs, have brought about the up-to-date utilization of byproducts of grains other than wheat and corn; these byproducts, when properly balanced into feed rations by experts, are filling the gap and establishing a more reasonable price for the commodity than could be expected if only wheat and corn feeds were used.

Alfalfa Used in Special Feeds

In the West, the great fields of alfalfa are supplying tens of thousands of tons of clean and nutritious feed for dairy cows, horses, mules, work stock and poultry; Kansas alone having more than one million acres planted to alfalfa in 1910. Colorado, Oklahoma and Nebraska also are in the alfalfa zone, though the plant grows in almost every state in the Union. But the states that produce four or five crops a year are making the producers welltodo. It has not been many years since alfalfa was fed as hay only, no thought being given to its value as a balancer of rations. Some concerns now, however, are manufacturing feeds from cut and ground alfalfa hay, making it into meal, and with this as a basis add crushed corn and oats and cane or beet sugar molasses to give the feed a delicious flavor.

Alfalfa meal is sold in great quantities to individuals and concerns doing their own mixing or balancing, as different proportions of the ingredients are required in different sections of the country. In some parts of the United States where feeding is on the increase, protein is the one thing most needed; other sections, having their own protein, must buy carbohydrates. Whatever its lacking may be obtained in another section to balance the ration in a manner suited to the animal to be fed.

In the manufacture of oatmeal a large waste of material would be inevitable if there were no use for the oat hulls, middlings, nubbins and bran. Careful study of these byproducts of the oatmeal mills showed them to possess great feed value. The great oatmeal industry has given the feeder of domestic animals an oat byproduct feed of value, and a specialty feed that is so well balanced as to come near in food value to the oat groat required for human consumption.

In the South great strides have been made in utilizing cotton seed and its various byproducts for feed. All sections of the United States where feeds are made require certain quantities of cotton seed meal, which analyze high in protein.

In the Northwest, aside from the large output of mill feeds from the flour mills, linseed byproducts are becoming common as valuable ingredients for certain specialty feeds.

Molasses feeds, generally made from broken grains not used in flouring mills, form a basis for a specialty feed that has made great advances in the last decade. The ingredients are carefully compounded to make a well balanced ration, and cane and beet sugar molasses is used in the mixture to give it a taste pleasing to the animals.

The corn feed industry was chiefly a local proposition until recently, greater use now being made of the hominy feed, the meal, grits, and ground ear corn. One great institution operates more than twenty mills and has a daily capacity of something like 100,000 bushels of corn. The meal, grits and hominy of course are the primary products of that concern, but the valuable byproducts so necessary in feeding are utilized in properly balancing feed rations.

Oats and corn in reality fix the price of concentrated feed stuffs. When oats and corn are high in price specialty feeds are easy to sell, but when prices are low, as has been the case for some months, feeders buy oats and corn and with roughage they have at home make up a fair ration. The science of feeding, however, is in the proper balancing of a feed, and it is reasonable to suppose that a concern with millions of dollars invested and employing experts to compound its feed can do better than can a feeder who really looks at it only as a side line or a necessity.

Southern states this year, for the first time, will ease off in their purchases of grain feeds. Louisiana and Mississippi especially are large producers of corn. For this reason many new feew plants have been building in the South, and the larger manufacturers of commercial feed stuffs have greatly increased their business in the southern states year by year.

The more one studies the scientific feeding problem the more the subject interests. To understand just how much protein, fat and carbohydrates are necessary in a feed for Wisconsin dairy cows, New England work horses, Ohio chickens, Montana sheep and thoroughbred live stock for breeding purposes is a big proposition. Certainly, then, the specialty feed industry is most important.

Every state in the Union has a department that pays some attention to the subject of feeding stuffs. States that have no special law to regulate the sale of feeds operate under the United States pure food and drug act, or a general misbranding act. The ruling idea seems to be, and rightfully, to secure a full measure of protection to the man who pays his cash for proper feed for his stock.

Few people realize how tremendous the feed industry is. It is a billion dollar business and is growing daily. In making the millions of barrels of flour needed for our people and for export the feed is also made, so this alone is a good start. In addition thousands of manufacturing plants are turning out annually tens of thousands of tons of feeds which do not contain the byproducts of the flour mills.

Distillers' and brewers' grains, dried beet pulp, meat scraps from packing houses, rice products, malt sprouts, cottonseed hulls, ground peanut hulls, kaffir corn, sunflower seed, milo maize, clover, various field and grass seeds, ground corn cob, flaxseed pods, elevator screenings, and in fact nearly everything which has any food value whatever, and is not poisonous or deleterious, may be used as straight feed or as an ingredient in the mixed feed.

Returning to the subject of protection for the feeder, one need look back only two years to see the work that has been done for him. Of course there have been state feed stuffs laws for many years, but it has been less than two years since the Association of Feed Control Officials of the United States was organized with the primary object of establishing a uniform feed stuffs law for all the states, thus to do way with many complications that have annoyed the shipper. A law in Mississippi, for instance, might suit very well a shipper in Chicago, but it might not suit a shipper in Nebraska or Kansas. Requirements in North Carolina might protect the feeder of that state, but might not do for Michigan or New York. Some states require license fees, others impose the per ton tax, some exempt certain mixtures and others do not. One state feed control official may have a vastly different idea as to the amount of fiber a feed should contain, while another state official is satisfied if the manufacturer tells on the bag just what it contains. Good results, therefore, are expected to come from the new uniform feed law which has been drawn, and which will be offered in the various states as their legislatures meet. The proposed law necessarily will be modified in some respects to fit certain state requirements, but the main features shown therein doubtless will be acceptable, as it gives to the feeder a greater measure of protection than he has ever enjoyed.—American Lumberman.

Scientific Management—The Camp Table

If it be as difficult to determine what scientific management is in lumbering operations as it has been to establish other scientific facts the conduct of lumber manufacturing and merchandising on a scientific basis is a remote contingency, says The American Lumberman. The scientist conceives of a possibility and sets about to determine whether or not his hypothesis of the case is subject to the demonstration. If scientific management is to be applied to the lumber industry it were well to begin at the beginning. Lumber first exists in tree form. The trees must be felled, cut into logs, skidded, loaded, carried to the mill in some manner and there so manufactured as to produce the greatest quantity and the greatest value in money.

Before any of this work can be inaugurated it is necessary to provide the housing and feeding the men. The camp table expense in all parts of the country has been increasing steadily. The cost is probably not less than 40 cents a day in any part of the country, and from this it ranges to as high as 75 cents, or 25 cents a meal. Those who first partake of the hospitality of the woodsman are amazed at the variety and quantity of food placed on the table. They are also much amazed to learn than the bill of fare is very much the same at all three meals. Pie, cake and pickles are served for breakfast, dinner and supper, and with this is an array of vegetables, meats, dried fruits, etc., that is truly astounding. At many camps three times as much food is served as is eaten. Only a part of it can be "made over." The remainder goes into the slop-barrel and is either thrown away or fed to the pigs.

The woodsman works hard, has long hours and is entitled to good food and plenty of it. At the same time, it is a question if the principals have not materially increased the cost of feeding their men without improving the food. The question of what and how much of each article shall be set on the table is left largely with the cook and the camp boss. It seems that the time has arrived when this matter should be given more attention, not with a view of depriving the workmen of a bountiful table, not primarily with a view of saving money, but with the idea of improving the service and the character of the "grub."

Into this problem enters a human equation which should not be overlooked. The table reputation of certain operators alone is sufficient to attract and hold the best woodsmen available. At the same time, it should not be absolutely imperative to serve six kinds of cake, four kinds of pickles, eight kinds of pie, five kinds of dried fruit, together with meat, vegetables, pancakes and tea and coffee for breakfast.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted

Ten cars 2-in. Log Run Maple. State best price for cash. Box 330, Canada Lumberman, Toronto, Ont. 18-23

Wanted to Buy—Ash, Elm, Birch and Basswood, either Log Run or on grades, Fred. T. Smith, 310 Board of Trade Bldg., Montreal. 11-tf.

WANTED

Cash paid for green clear Maple axles 4¼ in. x 5½ in., 6, 12 or 18 ft. long. If you can get out a carload or more write us. Warren Ross Lumber Company, Jamestown, N.Y. 18

Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

Lumber Wanted

We are open to buy a few cars of good common and better dry Soft Elm, Birch and Hard Maple, in 1½ and 2 in. thicknesses. Also give us a list of any other dry Hardwood Lumber you have. Address, The London Lumber Co., London, Ont. 18-21

White Pine Pickets Wanted

We want at once 4-4 x 4-4 x 44 in. and 48 in., 5-4 x 5-4 x 44 in. and 48 in., and 6-4 x 6-4 x 48 in. White Pine Pickets. If you have anything in the above write, stating quantity, when cut and best prices. Will buy any quantity from a car to your entire stock. Box 58, Ogdensburg, N.Y. 20

FOR SALE—LUMBER, ETC.

For Sale

100 cars Longford Hemlock, assorted sizes.
100 cars Whitney Spruce, any width.
25 cars Ravensworth Birch, 1 in. and thicker.

Apply to Quincy Adams Lumber Company, Limited, Longford Mills, Ontario. 14-17

For Sale

1 car 2-in. Rock Elm, mill run.
20,000 ft. 1-in. Soft Elm, 12-in. and wider, 1st and 2nd.
1 car 1-in. Basswood, common and better.
3 cars 3-in. Hard Maple, 1st and 2nd.
1 car 2-in. Hard Maple, 1st and 2nd.
1 car 1-in. Hard Maple, mill run.
Box 319 Canada Lumberman, Toronto, Ont. 17-t.f.

Charcoal

1,000,000 Paper Sacks, $7.50 per 1,000, ⅛-bbl. size. The sacks are suitable for sacking charcoal, cement, coal, lime, clay, sand, fertilizer and every product. All kinds of paper sacks, will furnish at bargain prices.

"WERNER,"
1842 North Park Ave.,
18-18 Chicago (Illinois), U.S.A.

FOR SALE—MACHINERY, ETC.

Logging Engines

For sale, two Logging Engines, made by Alex. Dunbar & Sons; only used one season. Apply to John Breakey, Regd., Breakeyville, P.Q. 18-18

Operating Saw Mill For Sale

at Uhthoff Station, G. T. R. Capacity 25 M. feet, containing stationary boiler, 80 h.p.; one engine, 50 h.p., and machinery outfit and building. Will accept $1,000 in full to close estate, as timber is done. Apply to W. B. Tisdale, Orillia, Ont. 17-t.f.

Bargains in Planing Mill Machinery

Two No. 44 Berlin planer and matchers, 9 x 6.
One No. 125 Berlin comb moulder and matcher, 10 x 6.
One No. 254 Berlin self feed rip saw.
One Williamsport self feed rip saw.
One Colloday small outside sticker.
Fifty heavy two wheeled lumber buggies.

RED CLIFF LUMBER CO.,
17-18 Duluth, Minnesota.

Machinery For Sale

Band saw, 37-inch Clement.
Carver, 4-spindle Rohlman.
One cut-off saw, railway wood frame.
Dovetailer, Boults.
Engines and boilers, various sizes.

I HAVE FOR SALE ON THE PACIFIC COAST

In Tulare County, California. A choice compact tract of 275,000,000 feet of redwood and 125,000,000 feet of sugar pine, nicely located to operate and can be marketed in Los Angeles, California. I want a buyer in the next six weeks. Can be bought at a bargain.

L. VAN WINKLE,
14-17 Santa Monica, Cal.

Sawdust Flooring

Sawdust flooring is among the subjects treated in reports from American Consuls. Consul-General Skinner, of Hamburg, writes as follows:—

"Considerable exportations of magnesium chloride have been made to various American purchasers, particularly in Los Angeles, Cal., all of which is understood to be taken up for the mixture thereof with sawdust for the production of a flooring that is both permanent and relatively inexpensive, and to a considerable extent fireproof.

"The flooring composition consists of a solution of magnesium chloride to which pulverised magnesia is added, and which of itself forms a white, absolutely solid, artificial stone. If to this cement sawdust be added in considerable proportions, the combination, when it becomes hard, possesses many of the qualities of both wood and stone. There are many manufacturers of these floorings in Germany, some of which are mixed on the spot and laid soft on the space to be covered, whilst others are moulded into plates and delivered ready made. One Hamburg firm impregnates the wood meal with oil before mixing it with the magnesia paste, and thereby renders it non-absorbent.
